Paul V., 1605–21.—After the brief pontificate (1605) of the Medici Leo XI., whose monument is in St Peter's, Paul V., a member of the Borghese family, became pope Great monuments such as the Villa Borghese still bear witness to the memory of this family in Rome. Paul, like his predecessors, was a nepotist; although he did not carry this practice to the extent of former times, he lost no opportunity of promoting his relatives to wealth and power This weakness, however, enabled him to continue the patronage which so many of the popes had extended to the arts, to beautify the Eternal City and thus to enhance the splendour of the papacy. The Church of St. Peter was completed, an extension was added to Michelangelo's central structure by Carlo Maderno, and the impressive vestibule was constructed. Pope Paul also decorated the Confessio and the subterranean chambers of St. Peter's, and in token of his special veneration for Our Lady he built the Cappella Paolina in S. Maria Maggiore, which is adorned with frescoes by Guido Reni. Paul V is buried in this chapel. The completion of the interior of the Quirinal, the Acqua Paola and other fountains, and the improvement of the streets of Rome are also due to the constructive energy of this pope, under whom the population of Rome increased to over 100,000 In addition, he reformed the administration of justice in Rome and laid the foundation of the new papal secret archives

Paul V, who was a man of great piety and virtue, was also active in the religious sphere. He completed the reform of the liturgical books by the issue of the admirable *Rituale Romanum*, promoted the veneration of saints, and wherever possible carried out reforms on the lines laid down by the Council of Trent At this time the Capuchins were achieving great success as popular preachers In the conflict which was then raging between the Roman theologians and the representatives of the new scientific knowledge which was growing up, the pope showed kindness to Galileo Galilei and comforted him in his misfortunes. He proved himself a vigorous defender of the rights of the Church in his relations with temporal powers, and in particular against the encroachments of Venice, where Paolo Sarpi wished to make the Church dependent on the State. Much was done to promote missionary work in Japan, China, India, Persia, Ethiopia, the Congo and the colonies of the New World

In France, ever since the reconciliation of Henry IV. with the Church, the Catholic revival had made great progress, as also in Germany, Switzerland, Poland and the Spanish Netherlands. In the latter country there was at the same time a great artistic revival, and Rubens and Van Dyck helped by their works to improve the understanding of the Catholic faith. In other countries also, religious art received a new impetus. The baroque style, which is full of vigorous religious feeling, gave expression to the revivified life of Catholicism by the building of wonderful new churches

The position of the pope with regard to the empire was a difficult one owing to the madness of Rudolf II. and the dispute between the Habsburg brothers. He made every endeavour to prevent war breaking out between the Catholics and Protestants in Germany. The course of events, however, compelled him to intervene, and the victory of the Weisse Berg (1620) resulted in the overthrow of the "Calvinist Monarchy" of Prague and the predominance of Catholicism in the Habsburg lands and the Empire.

In England fresh legislation against the Catholics was adopted as a result of the Gunpowder Plot (1605), which was regarded as being due to Catholic teaching. The Catholics were required to take an oath which stigmatized the Catholic Church a sect inimical to the State and to civilization; this oath, which was banned by Paul V., provided James I., who himself entered the lists of theological controversy, with a potent weapon against what remained of Catholicism in England.

Gregory XV., 1621–23.—Gregory XV., who was a member of the Ludovisi family, was exceedingly zealous in his endeavours to promote the victory of the Catholic cause in the war in Germany which followed the Bohemian revolution. The real conduct of affairs was in the hands of his young nephew Lodovico Ludovisi, who did not neglect the temporal interests of his own family. It was he who built the Villa Ludovisi, which became a repository of art treasures. His main energies were, however, devoted to increasing and extending the power of the Church. Subsidies were sent to the emperor and to the League, and the pope supported the transfer of the office of elector of the Palatinate to the Duke of Bavaria, in return for which the latter presented the pope with the valuable Heidelberg library. The Catholic revival was initiated in the Palatinate on the right bank of the Rhine after its conquest; and indeed the revival of the Church everywhere made astonishing progress, and almost reached its zenith, under this energetic pope, whose pontificate in many respects resembled that of Gregory XIII.

The foundation of the *Congregatio de propaganda fide* (1622) focussed the Catholic missionary movement round one centre and enormously increased its strength. Gregory also laid down new rules for the papal elections. He carried on negotiations with the king of England for the marriage of the prince of Wales to a Spanish Infanta, but this attempt at a union between Anglicanism and Catholicism was unsuccessful. He was however able to avert war between France and Spain on the Valtelline question.

Urban VIII., 1623–44.—The long reign of the Barberini Pope Urban VIII. occupied two-thirds of the period of the Thirty Years' War. Urban tried to make peace between the houses of Bourbon and Habsburg so that their combined strength might be used against the Turks and the Protestants. But Richelieu worked against this policy; as the statesman who guided the destinies of France, he made it his principal aim to make France the chief power in Europe in place of the Habsburgs, and to break the power of Spain and Austria by a combined attack. The unscrupulous and Macchiavellian cardinal made alliances with Protestant powers, and even encouraged the Turks to attack the emperor. He succeeded in hoodwinking the pope as to his real aims, and in inducing him to assist the policy of France. Urban was anxious to maintain the papal territories, which had at that time attained their greatest extent by the inclusion of the duchy of Urbino, and thus to secure the independence of the apostolic see. For this reason he felt the territorial predominance of Spain in Italy, and the possibility of any further extension of the power of the Habsburgs there, as intolerable. He therefore tried to find some counterpoise, and, as was shown in connection with the succession question in Mantua, he thus played into the hands of France. He nevertheless protested against the alliance between France and Sweden, which seriously threatened Catholic interests in Germany, and he rejoiced at every success of the imperial forces. He gave financial help to the emperor and the League, although somewhat cautiously and inadequately. He encouraged the alliance between Bavaria and France because he hoped by this means to detach Richelieu from his alliance with the German Protestants. The purely secular policy of Richelieu, which took no account of religious considerations, completed the destruction of the power of the papacy in international politics, which had already suffered severely from the religious schism. From that time onwards the other Catholic Powers also based their policy on purely secular considerations, and the Holy See ceased to be a centre of unity among nations as it had been in the middle ages.

Urban VIII. was more successful in ecclesiastical matters than in international politics. Although the religious revival was paralysed in Germany by the war, it bore fruit in other countries. St. Vincent de Paul in France, and a large number of devoted missionaries in other countries, helped to spread Christianity in Asia, Africa and America. The pope created the Propaganda College and the famous Propaganda Press in order to develop missionary work. He initiated a new arrangement of the calendar of festivals, and conferred the title of "Eminence" on the Cardinals. The condemnation of Galileo (1633), whose discoveries he had celebrated in verse when he was a cardinal, took place during the pontificate of Urban VIII. This regrettable blunder was due to a number of unfortunate influences. The pope, who was an excellent classical scholar, was a patron of literature and published his own verses. He also revised the breviary, but it was to be regretted that the beautiful old hymns were re-written in classical metre. He was a great builder: churches and palaces, and fountains in the streets and squares of Rome, were set up, and the fortifications of the city were improved. The bees which appear on the coat of arms of the Barberini may be seen on an immense number of the public buildings of Rome; and the city is full of monuments by the great baroque architect Bernini, who built the gigantic Confessional in St. Peter's and the mausoleum of the famous Countess Matilda. This proud and self-willed pope was the last to practice nepotism on a grand scale.

Innocent X., 1644–55.—The pontificate of Innocent X., who was a Pamphili by birth, was darkened by the quarrels of his nephews, and by his relation to his ambitious and greedy sister-in-law Donna Olympia, who completely ruled the well-meaning old man and was the most powerful person in the Curia. This regrettable state of affairs, which the Calvinists made a pretext for unjustified aspersions on the morals of the pope, did much to injure his authority. He was exceedingly zealous in maintaining the purity of doctrine. The minds of the faithful had been much exercised by the controversies on the question of grace which had arisen since the Council of Trent; and in 1655 the pope condemned five theses from the *Augustinus* of Cornelius Jansenius, which had originated the Jansenist movement. Innocent X., like his predecessors, refused to recognize the king of the newly founded kingdom of Portugal, out of consideration for Spain. He sent money to the consort of the unhappy King Charles I. of England, and supported the Catholic Irish against the English, as also the Venetians in their struggle with the Turks. The conversion of several Protestant princes of Germany to Catholicism was a matter for great satisfaction. The pope protested against the Peace of Westphalia, 1648 (*q.v.*)—not against the conclusion of peace itself, but against those clauses of the treaty which were contrary to the rights of the Church and the pope. Innocent was buried in the Church of Sant' Agnese, on the Piazza Navona; this church, as well as the fountain by Bernini in the same Piazza, was erected by his order. A portrait of him by Velazquez is to be seen in the Doria Gallery.

Alexander VII., 1655–67.—Fabio Chigi, who had for many years been Nuncio in Cologne, now became pope under the title of Alexander VII. The new pope was adroit, learned and ascetic. Unfortunately he too was not free from the bad custom of nepotism, which was only too closely bound up with the traditions of the Curia; he provided for his relatives from Siena with lands and lucrative offices. He disliked political business, and left it for the most part to his secretary of State, Rospigliosi. He was prudent in the conduct of Church affairs; he was a patron of the Jesuits and was vigilant against the manoeuvres of the Jansenists. He had many difficulties with Portugal, where the king threatened to set up a national Church, and still more with Louis XIV. of France, who, on the pretext that his ambassador had been insulted by the papal guard, broke off relations with Rome and occupied Avignon. The pope was helpless against him, and was

obliged to conclude a humiliating treaty with him in 1664. In view of the growth of Gallicanism, this was a severe blow to his authority. On the other hand, he derived great satisfaction from the fact that Queen Christina of Sweden, the daughter of Gustavus Adolphus, became a convert to the Catholic faith and settled in Rome, where she died in 1689. He commissioned Bernini to build the splendid Scala Regia in the Vatican and the colonnades of the square of St. Peter's. Bernini also built his tomb in St. Peter's.

Clement IX., 1667–69.—Another Tuscan, the former secretary of State Rospigliosi, was now elected to the Holy See under the title of Clement IX. He was a man of affable character and unusual literary culture. Temperate in his own life, he nevertheless did not forget the interests of his relatives. He lightened the taxes of the population of Rome. He settled the dispute with Portugal, and normal ecclesiastical conditions were restored. He also took an active part in the negotiation of the Peace of Aix between France and Spain (1668). He promoted missionary work, and helped the Venetians in their struggle against the Turks; in spite of this, however, it proved impossible to save Candia. The provisional settlement of the Jansenist controversy is also due to Clement IX.

Clement X., 1670–76.—Clement X, the last of the Roman family of the Altieri, was already 80 when he became pope He was a man of pious and charitable character He assisted the Poles in their difficult struggle against the Turks The business of government was carried on by his adopted nephew, the ambitious Cardinal Paluzzi-Altieri, a self-seeker and a man of little political ability It was Clement X who planned the Piazza del Gesù and constructed the second fountain in the square of St. Peter's. His great tomb is to be seen in St Peter's itself

Innocent XI., 1676–89.—The next pope, the Lombard Odescalchi, who took the name of Innocent XI, was one of the most saintly figures in the history of the papacy He was a man of such austere and holy life that he seemed a fit subject for the new procedure of beatification, which was introduced under Clement XI, but not completed He undertook a number of reforms, and was scrupulous in refraining from favouring or enriching his relations, either by open or by covert means He remedied the disorder which prevailed in the finances of the Papal States, limited the expenditure of the papal court, and tried to root out the abuse of the sale of offices. He issued strict regulations in order to raise the moral standard in the Church He instructed the clergy not to indulge in dialectical sophistries in their sermons, but to preach the crucified Christ A sumptuary order was issued with the object of discouraging luxury, and women were forbidden to appear with bare neck and arms The passion for gambling among the Roman nobility was checked by the closing of gaming houses, and the usury of the Jews by the institution of *monti di pietà* The pope also introduced reforms into the educational system Innocent XI. condemned 65 theses from the writings on morality of various Jesuits He was equally severe against Molinos, whose doctrine of quietism, according to which the highest stage of perfection is to be found in complete passiveness, seemed likely to be a source of confusion

Dispute with Louis XIV.—It was inevitable that Innocent XI., who placed the Church above everything, should come into conflict with Louis XIV., who stood for the omnipotence of the State. Their first serious dispute arose in connection with the "regalia," which the king regarded as part of the rights of the Crown and claimed to exercise throughout the territory of France. According to this theory, whenever a bishopric was vacant, the revenues and the right of filling benefices in the diocese belonged to the king The pope refused to recognize this claim, which went beyond what had formerly been customary; and the king called an assembly of the French clergy in 1682 which adopted the so-called "Liberties of the Gallican Church" These four articles maintain that the temporal sovereignty of kings is independent of the pope, that a general council is above the pope, that decisions on matters of faith only become valid by the consent of the Church, and affirm the unalterable validity of the national rights of the Church of France. Rome could not accept these articles, which were intended to affirm the privileges of the Gallican Church. Innocent rejected them, and could not be induced to make concessions even when Louis XIV. began his shameful persecution of the Huguenots. New complications arose when the right of asylum exercised by accredited ambassadors to Rome was abolished. Almost all countries realized that this antiquated rule, which enabled anyone fleeing from justice in Rome to take refuge in the premises of one of the embassies, rendered the proper administration of justice impossible; but Louis XIV. protested against its abolition, and took vigorous measures of reprisal

James II. and William of Orange.—Innocent condemned not only the violent measures which were taken against the Protestants in France, but also the ill-considered and hasty manner in which James II. attempted to restore Catholicism in Protestant England, where the constitution of the Church was closely bound up with that of the State In vain he warned the king, who was under the influence of France, of the danger of a breach with parliament. It is thought that he was aware of the plan to place William of Orange on the throne of England, and that he did not regret James II's fall, which he hoped would destroy the preponderance of Gallican France

Defeat of the Turks.—Missionary work was carried on with great energy during Innocent's pontificate. In order to assist the struggle against the Turks he brought about an alliance between Poland and Austria, and he lived to see the saving of Vienna in 1683, and the liberation of Hungary a year later As a result of the victory over the hereditary enemies of Christianity, the Odescalchi were raised to the dignity of princes of the empire, and received the Hungarian duchy of Sirmium

Alexander VIII., 1689–91.—The Venetian Ottoboni now became pope, with the name of Alexander VIII. Unlike his predecessor, he practised nepotism, and enriched his nephews He purchased the library of Christina of Sweden for the Vatican, condemned a number of heretical doctrines, and was active in charitable works He assisted his native city in its war with the Turks. Partial satisfaction was at this time received from France, which gave up the right of asylum.

Innocent XII., 1691–1700.—Owing to the opposition between the Spanish and Imperial party and the French party in the College of Cardinals, it was only after a five months' conclave that the Neapolitan Pignatelli was elected pope He took the name of Innocent XII. Benevolent, charitable and frugal, he called the poor his relations and put an end to the pernicious practice of nepotism among the popes by his Bull of 1692 Even since that time the families of popes have sometimes been aggrandized, but the system of nepotism was abolished. Innocent also put an end to the abuse of the sale of offices, and made excellent laws for the government and administration of justice in the Papal State He was responsible for the completion of the Monte Citorio (Curia Innocenziana) The Roman nobles were severely punished for all offences against the law, and the pope also endeavoured to improve discipline in monasteries At this time the French clergy revoked the resolutions of 1682, and Louis XIV., who was anxious, in view of the alliance against France, to live at peace with the Church, abolished the obligatory teaching of the Gallican articles. The pope then declared in favour of the French claim in the question of the Spanish succession, but without taking up an attitude of direct opposition to Austria, although the overweening conduct of the imperial ambassador in Rome had given offence, notwithstanding his recall by the Emperor Leopold. The Peace of Ryswick (1697) appointed the pope as arbitrator in the dispute about the succession to the Palatinate; the decision was given by Clement XI in 1702

THE AGE OF "ENLIGHTENMENT"

The 18th century was the period of the greatest difficulty for the papacy. Infidel philosophy, the insincere and superficial "enlightenment" movement, and a spirit of frivolous and mocking scepticism bid against one another for ascendancy over the minds of men. The revolt against authority spread from the religious sphere to morality, politics and science, and the temporal powers encroached more and more on the domain of the Church, with the

aim of subjugating it entirely. All these disintegrating influences led in Catholic countries as well as in others to a slackening in the vitality of the Church.

Clement XI., 1700–21.—The long reign of Clement XI, who was a member of the Albani family, was a period of trouble and difficulty. Clement was extremely active in promoting missionary work, and was a zealous preacher. He adopted a firm attitude towards Jansenism, and in 1713 condemned 101 theses from Quesnel's book. This Bull aroused strong opposition in France. The pope took a number of measures with the object of improving ecclesiastical discipline and public morality, and alleviating the lot of the poor. His relatives did not become powerful until after his death. He set up the Academy of Painting and Architecture in Bologna, and did much in Rome for the restoration of monuments and churches, as well as enriching the Vatican library with oriental manuscripts. He endeavoured to remain neutral in the War of the Spanish Succession (*q.v.*), which created serious disturbances in Italy also; but he appeared to incline to the side of the Bourbons rather than to that of the Habsburgs. The Emperors Leopold I. and Joseph I. made ruthless use of their power, and oppressed the papal State. The claims of the pope were ignored by both sides in the peace negotiations of 1713

The English Pretender, James III., who had left France for Italy in 1717 and had married Maria Clementine Sobieski, was hospitably received by Clement XI. and was given the title of Knight of St. George. It was during the troubled pontificate of Clement XI. that Frederick, Elector of Brandenburg, took the title of king of Prussia (1700), and laid the foundation of a new great Protestant Power. Clement protested, though in vain, against the formation of the new kingdom, since the duchy of Prussia was the property of the Teutonic Order and had not been lawfully transferred.

Innocent XIII., 1721–24.—Innocent XIII. gave help to the Venetians and the Maltese against the Turks. He granted a pension to the Pretender, James III., and promised him subsidies if circumstances should become favourable for him to attempt to regain the throne of England and to re-establish Catholicism there. He invested the Emperor Charles VI. with the kingdom of Sicily, without raising the question of the *Monarchia Sicula;* but he protested when the emperor, disregarding the ancient right of overlordship of the pope, gave the fiefs of Parma and Piacenza to the Spanish Infante Don Carlos.

Benedict XIII., 1724–30.—Benedict XIII, who was a Dominican and a member of the ducal house of Orsini-Gravina, attached much importance to austerity of life, checked the ostentation of the cardinals, and forbade games of chance in Rome. He encouraged scholarship among the clergy He presided in person at the Provincial Council at the Lateran in 1725. He enjoyed the triumph of receiving the submission of Noailles, archbishop of Paris, who had headed the opposition against the Bull of 1713. Others followed the archbishop's example, and Jansenism ceased to be of importance as a heresy. The emperor restored Comachio, which had been taken from the Papal States in 1708. The question of the ecclesiastical privileges of the ruler of Sicily (*Monarchia Sicula*) was settled owing to the conciliatory action of the pope, who also showed his readiness to compromise in connection with the ecclesiastical claims of the king of Sardinia, in whose domains freethinkers were influential. It was owing to his lack of experience in worldly affairs that the pope, who was entirely absorbed in spiritual matters, gave his confidence to a worthless favourite, the hypocritical and avaricious Cardinal Coscia, whose gross maladministration reduced the finances to a state of confusion.

Clement XII., 1730–40.—Clement XII. was a Florentine of the Corsini family. Although he had become blind comparatively early in his reign, his mind continued to be active, and he was a great patron of art and learning. He had a great deal of useful building work done in Rome; churches were restored, the arch of Constantine was repaired, and the museum of the Capitol was enriched with busts and inscriptions and the Vatican with oriental manuscripts.

Clement was active in furthering missionary work, issued new rules for the English College in Rome, and set up two seminaries for the Greeks of Lower Italy and a special seminary intended to promote the union of the Western and the Eastern Church. He forbade Catholics to become members of the secret societies of the Freemasons. He showed much kindness to the English Pretender, James III., and his family. He also gave the emperor considerable subsidies to help him in his war against the Turks. Clement did not have much success in political affairs, for the principle of absolutism, which was warmly supported by the so-called regalists, tended more and more to undermine the authority of the Holy See.

Benedict XIV., 1740–58.—The election of the new pope took six months, owing to the rivalry between the various powers. Finally Lambertini, archbishop of Bologna, was elected and took the name of Benedict XIV. He was a scholar of recognized eminence and a man of excellent character, notable for his constant serenity of temper and kindness of heart, and for his strict and conscientious way of life. He made it a principle that he should be pope first and ruler afterwards. He was the author of a number of books which show him as an excellent canonical scholar. He collected scholars round him and encouraged them to undertake important studies, and he corresponded with foreign writers, including some who were Protestants. He founded learned societies in Rome for the study of Roman and Christian antiquities, canonical law and Church history, and enriched museums and libraries, as well as the academy of his native city, Bologna. He interested himself in the neglected Coliseum, where he erected the Stations of the Cross. He issued important rules for the sacraments of confession and marriage, as well as for the various Eastern rites. He re-issued the Roman Martyrology, and set up a number of new bishoprics in Europe and America. He forbade missionaries to take any part in trading He was much troubled by the exhausted state of the finances of the Papal States, and tried to remedy the situation by introducing a system of economics in all branches of the administration and by encouraging commerce and agriculture. His efforts were however to a large extent rendered useless by the serious damage which the papal territories suffered as a result of the Austrian War of Succession.

In his relations with temporal Powers, the pope showed a peaceable and tolerant disposition and endeavoured to effect a reconciliation between the spirit of the 18th century and the ancient rights of the Church. He dealt with the Courts on moderate and conciliatory lines, and did not attempt to maintain unyieldingly all the mediaeval claims of the papacy. He concluded concordats with Spain, Portugal, Sardinia and Sicily which embodied very far-reaching concessions as regards the dependence of the clergy on the Crown. In various countries the number of religious festivals was reduced, but the pope gave instructions that those which were retained should be celebrated all the more worthily. He also managed to maintain good relations with the German empire. He recognized the kingdom of Prussia, although the state of the Church in Silesia, which had come into the possession of Prussia, was deplorable. The pope also showed wise moderation in his encyclical to the French bishops (1756), in which it was stated that only open and notorious opponents of the Bull of 1713 were to be refused the sacraments. The reign of this pope, who won the respect even of those who were not Catholics, thus passed without serious disputes; but a storm was already brewing against one of the strongest pillars of the Catholic Church, the Order of Jesuits.

Clement XIII., 1758–69: The Expulsion of the Jesuits.—The reign of the Venetian Rezzonico, who took the title of Clement XIII., was an almost uninterrupted series of struggles for the rights of the Church and for the defence of the Society of Jesus, which had earned the bitter hatred of anti-papal circles by its zeal for dogmatic belief and for the principle of authority, especially against Jansenism and Gallicanism. The Order of Jesuits, which possessed great political influence in the various Courts, also had many opponents in the Church itself. Most of the other Orders looked askance at this Order which had outstripped them all. Individual Jesuits had been subjected to papal censure for harmful doctrines put forward in their works on moral questions. They were also accused of abuse of the confessional, disobedience

towards bishops, ambition, avarice, undue acquisitiveness, and other faults, although their accusers did not produce any individual proofs of their allegations. The attack was led by Portugal, where the Jesuits, who had influence at Court, interfered with the attempt of the minister Pombal to introduce a system of unqualified absolutism. Some were imprisoned without trial, others were deported to the Papal States as "a present for St. Peter." This state of affairs led to the breaking off of relations between Portugal and the Holy See. The French *parlement* declared that the rules of the Order were harmful and incompatible with the Gallican liberties; and in 1762 it was decided to suppress the order in France. Spain and Sicily, irritated by the pope's repeated protests, also decided to expel the Jesuits. In Parma, which was ruled by the king of Spain's nephew, a number of laws were adopted which were incompatible with canonical law; Clement, as pope and overlord, sent a *monitorium* to the Duke in 1768, whereupon the Jesuits were also expelled from Parma, and the Bourbon Courts peremptorily demanded that Clement should dissolve the Order He refused to give way, though some of the Cardinals advised him and the secretary of State, Torrigiani, to bow to the storm. Clement, however, who was a man of saintly life and character, thought it better to let the Bourbon Powers occupy part of the papal State rather than to abandon the Jesuits, whom he believed to have been falsely accused.

Another event of the stormy pontificate of Clement was the condemnation of the work of Nicolaus Hontheim, Coadjutor Bishop of Treves (1764). This prelate, who wrote under the name of Febronius, was under the influence of Gallican ideas; he put forward the theory that the bishops acting collectively constituted a higher authority than the pope, that the latter only enjoyed such powers as were necessary to maintain the unity of the Church, and that he must therefore renounce some of his rights of primacy either voluntarily or under pressure from the bishops Clement strongly urged the combatants in the cruel struggle of the Seven Years' War to conclude peace

Clement XIV., 1769–74: The Suppression of the Jesuits.—The conclave of 1769 received an unwonted visit from the young Emperor Joseph II, who told the cardinals that the principles of former days were no longer applicable, and urged that the person to be elected should possess the virtue of wise moderation This quality was in fact possessed by the Franciscan Ganganelli, who became pope under the name of Clement XIV. The new pope followed the example of Benedict XIV, and tried to establish good relations with the "enlightened" Governments He entered into personal correspondence with the various sovereigns, suspended the reading of the Bull *In Coena Domini* (a collection of sentences of excommunication), revoked the *monitorium* to Parma, and re-established relations with Portugal at the cost of a number of concessions He manifested his desire for reconciliation on all hands, hoping by this means to induce the Bourbon cabinets to drop their constant demands for the dissolution of the Order of Jesuits. His hopes were, however, doomed to disappointment. There was already beginning to be talk at the Bourbon Courts of a definite breach with Rome, and the diplomats succeeded in intimidating the pope, who was lacking in courage and who did not allow the cardinals to exercise their influence. He made many attempts at evasion, and suffered bitterly under the pressure exercised on him. Finally, without preliminary canonical procedure, he issued the Brief of 1773, by which the Order was suppressed throughout Christendom in order that peace might be restored.

As ruler of the Papal States, Clement XIV. tried to restore the financial chaos to order and to encourage industry. He was not very successful in this. He was keenly interested in art and learning, and founded the Museum Pio-Clementinum, which was enlarged by his successor. The story that he was poisoned by the Jesuits is an invention.

Pius VI., 1775–99.—The pontificate of Pius VI., whose former name was Braschi, was longer than that of any previous pope. He was a pious, gentle and highly cultivated man, and he regarded what had been done against the Jesuits as the work of irreligious ministers. He therefore secretly favoured the Jesuits, and planned to restore the Order as a bulwark against the rising tide of revolution. He did a great deal for Rome and the Papal States. He undertook the costly work of draining the Pontine marshes, and improved the harbour of Ancona. The Eternal City, which was at that time visited by many sovereigns, was constantly being adorned with new buildings and with treasures of antique art. The Emperor Joseph II. described Rome as "a city of unequalled splendour, where an impulse towards greatness was everywhere visible." The Appian Way was restored, and the sacristy of St. Peter's completed.

The philosophical revolution which preached the destruction of Christianity and the Papacy was now in full swing, and it looked as if Voltaire's cry against the Church, "*Ecrasez l'infâme!*" would be translated into reality. Italy did not escape infection by the new ideas from France, and there were freemasons even among the clergy. The Grand Duke Leopold of Tuscany, the brother of Joseph II, was the most active promoter of the new ideas, but hostile measures against the Church were also taken in Venice and Naples Febronianism gained ground in the Courts of Germany, notwithstanding the fact that it had been condemned by Clement XIII Pius VI. succeeded in inducing the initiator of the movement to recant, but his ideas were taken up by the archbishop electors and the archbishop of Salzburg in the Punctation of Ems (1786), which aimed at increasing their metropolitan rights at the expense of the pope's. Serious disorder seemed on the point of setting in, but the French Revolution broke the power of the three electors of the Rhineland, and the great secularization of ecclesiastical property ensued in 1803.

The Emperor Joseph II.—In Austria the Josephist movement prevailed; Maria Theresa and Joseph II issued a number of decrees which aimed at bringing the Church under the control of the sovereign State The movement contained some just and reasonable elements, mingled with much that was unjust and excessive. There was much talk of the secularization of the property of the Church and the religious Orders, of the appointment of bishops without the intervention of the pope, and of the abolition of Church laws. Joseph II, "Brother Sacristan," as Frederick II. called him, dissolved hundreds of monasteries and relentlessly swept away festivals, processions, confraternities, old customs, and much that made for the splendour of worship While these measures of intolerance were being taken against the Catholic Church, an edict was issued in 1781 proclaiming toleration for all recognized Christian creeds Pius VI, the "holy traveller," undertook the difficult journey to Vienna in 1782 with the object of softening the obduracy of the autocratic emperor, but met with little sympathy either from him or from his minister Kaunitz

In England the position of the Catholics during the 18th century continued to be unfavourable. The spirit of indifference in religious matters which made it possible for Englishmen and Scots not to be members of the national Church brought no relief to the Catholics, while in Ireland they lived poor and despised

THE FRENCH REVOLUTION

The greatest source of trouble and difficulty to Pius VI was the French Revolution, which was a consequence of the revolt against the Church The pope fought courageously against the Terror, when the worship of reason was proclaimed (1793). Napoleon Bonaparte revenged himself for the assistance which the pope had given the Allies against France by attacking the unprotected Papal States. A temporary respite was purchased at the cost of immense sacrifices by the Truce of Bologna (1796) and the Peace of Tolentino (1797). Valuable manuscripts and priceless works of art were taken from Rome and sent to Paris. Jacobin agents had already succeeded in gaining influence over the minds of young people in the Papal States, and the French ambassador's residence in Rome became a focus for revolutionary activities A riot in which the arrogant French General Duphot was shot gave the desired pretext for the entrance of the French troops into Rome and the proclamation of a republic (1798) A statue of the Goddess of Liberty, who was represented trampling on the tiara, was set up outside the Castle of St. Angelo and was intended to symbolise the end of the rule of the pope. The republicans

instituted a reign of disorder and pillage. Pius VI., ill as he was, refused to give up his rights, and was brought as a prisoner to Valence, where death put an end to his sufferings in 1799. Thus the papacy ended the 18th century in exile.

Pius VII., 1800–23: The Concordat of 1801.—The conclave was held in Venice under the protection of Austria, and the Benedictine monk Chiaramonti was elected pope in 1800 under the name of Pius VII. He was assisted in the extraordinarily difficult task which lay before him by the ablest ecclesiastical statesman of the century, Ercole Consalvi, who had received his early training in the College of Cardinal Henry of York at Frascati. Rome was restored to the pope as a result of the political changes which took place, and the condition of the diminished papal State was improved as far as possible by economical administration and the development of agriculture. Napoleon, who had become First Consul in 1799, realized that his power could only be consolidated by the restoration of the Church in France and by a reconciliation with the Holy See. He had need of the pope in order to become emperor. After long negotiations, a Concordat was concluded in 1801; although it made the French clergy entirely dependent on the Government, it nevertheless represented a great improvement, since the Catholic Church was once more firmly established in France. Pius protested, though in vain, against the additions which Napoleon arbitrarily made to the Concordat by the Organic Articles. In the hope of gaining further advantages for the Church, he consented to go to Paris and to anoint Napoleon I. as hereditary emperor of the French (1804).

Napoleon showed more and more clearly that he aimed at universal power. He expected that all Italy should submit to him, and that the Pope should abandon his neutrality and join in the blockade of England. He put forward increasing demands both on political and on ecclesiastical matters, and when they were refused, he occupied Rome in 1808, while in the following year he proclaimed the union of the Papal States with the French empire, and, as the Emperor Frederick I. had once done, declared Rome directly subject to the Emperor. When the pope dared to issue a Bull of excommunication against the "robber of the patrimony of Peter," he was taken as a prisoner first to Savona and subsequently to Fontainebleau. A National Council was called in 1811 with the idea of intimidating the resolute pope, and giving a veneer of legality to the Emperor's ecclesiastical policy. Although Napoleon's star was already beginning to sink in the Russian campaign, he continued to increase his demands, and in Jan. 1813 he had a personal interview with the captive pope, at which he produced the preliminaries of an agreement. These he afterwards published, falsely alleging them to be an arrangement accepted by both parties (Concordat of Fontainebleau). Pius, seeing that he had been tricked, revoked the concessions which he had made; he no doubt suspected that his exile was nearing its end. He recovered his freedom on the fall of Napoleon. His entry into Rome, amid popular rejoicing, on May 24, 1814, was a brilliant triumph for the Church. Napoleon's return to power for the Hundred Days in 1815 meant fresh difficulties for the papal State, and the pope himself was obliged to flee; but this was little in comparison with what had gone before. At the Congress of Vienna (*q.v.*), in 1815, Consalvi exerted all his diplomatic skill in order to obtain the benefit of the principle of legitimacy for the pope as the principal representative of the conservative spirit which the congress embodied. The Holy See recovered all its former possessions with the exception of Avignon and the Venaissin, which remained in the hands of France, and a district on the left bank of the Po, which fell to Austria.

THE 19TH CENTURY

There now began the period of the Restoration, in which the sovereigns of Europe bent their energies towards re-instituting the previous state of affairs. In Rome the reorganization of the Papal States was taken in hand; many of the French innovations were retained, the old municipal and provincial institutions were abolished, and an absolute bureaucracy was set up on the French model. This excessive centralization, which excluded laymen from all high offices, aroused bitter and unceasing complaints against the "rule of the priests."

The pope also had much to do beyond the frontiers of the Papal States in reorganizing ecclesiastical affairs. He was much assisted by the Romantic movement of the day, which regarded the Revolution as a divine punishment for the falling away of the peoples from religion. In all countries there was a revival of Catholicism, which was looked upon as the remedy for the disorders of society, and as the mainstay of the throne. Joseph de Maistre extolled the pope as a mediator standing above the nations and their sovereigns. The Society of Jesus was re-instituted by a Bull of 1814; it set to work again, and made a great contribution to the intellectual and moral revival. Concordats with various countries were concluded or prepared; even Prussia, which had acquired large Catholic territories in the West, concluded an agreement of this kind.

Pius VII. was not neglectful of art and scholarship. He did much to enlarge the Vatican library and art collections, and continued much of the building which had been begun under Napoleon's rule with the object of beautifying Rome. Now that international peace had been restored, Rome became the meeting-place of kings and emperors, and a centre of attraction for artists such as Canova, Thorwaldsen, Cornelius, Overbeck and others. The most magnificent ancient basilica of Rome, S. Paolo, was burnt down during the Pope's last illness. Pius VII.'s tomb, by Thorwaldsen, is to be seen in St. Peter's.

Leo XII., 1823–29.—Count della Genga now became pope with the title of Leo XII. He was a pious man, strict in observing the rules of the Church. He promoted missions, improved the educational system in Rome, and did much for the Irish and German Colleges. He had excavations undertaken which greatly added to what was known of the topography of Rome, and had great buttresses constructed to support the Coliseum. He warned the bishops against the Protestant Bible societies, and also opposed the doctrines of indifferentism, as well as freemasonry. Vigorous efforts were made to root out the revolutionary Carbonari. The Sanfedisti, who were countenanced by the Government, assisted in the persecution of the Carbonari, and there were sanguinary conflicts, especially in the Romagna, where the Legate Rivarola proceeded with excessive severity. The policing of morals was carried out on inquisitorial lines. Leo maintained good relations with the secular Powers, and continued the policy of Concordats, which he extended to the South American republics. The Jubilee Year of 1825 was celebrated as a year of reconciliation and pardon. Leo XII. is buried in St. Peter's.

Pius VIII., 1829–30.—Pius VIII., formerly Francisco Castiglione, gave an indication of the purity of his intentions immediately after his election by forbidding his relations to come to Rome. An important event of this period was the Catholic Emancipation Act of 1829, which was adopted in England after a long struggle, largely owing to the efforts of Daniel O'Connell. This act allowed Catholics to sit in parliament and to hold public office; emancipation was not complete, but Catholics obtained a greater measure of freedom, and increased in numbers. The pope augured much ill from the July Revolution in France. There was much unrest in the Papal States and throughout Italy, and the secret societies became more and more daring.

A new period of revolution now began. It was directed against the absolutist and conservative system of the Restoration, which aimed at a return to the past at a time when men of intellect in all countries were awakening to the idea of the intrinsic value of the nation and were demanding intellectual, political and national liberty. The principles of enlightenment once more began to gain ground, and assumed the form of liberalism and constitutionalism, the guiding principles of the 19th century.

Gregory XVI., 1831–46: Growth of Revolutionary Ideals.—The new Pope Gregory XVI., formerly the Camaldulian monk Mauro Cappelari, was not yet crowned when the Paris Revolution of July 1830 set central Italy ablaze. The revolt raged throughout the Papal State, and could only be suppressed by Austrian bayonets. The pope and his secretary of State Bernetti themselves realized that reforms were needed. The ambassadors of the Powers, including the British representative in Florence, who was not without sympathy for the revolt, presented a memorandum

in 1831 demanding the admission of laymen to a share in the administration and to judicial posts, municipal self-government, provincial councils and a State council to consist of laymen. The pope, who resented the interference of diplomats, agreed to an amnesty, and to a few useful concessions, which were however administrative rather than political in character. A loan was raised from Rothschild on onerous terms in order to meet the financial difficulties to which the prevailing unrest had given rise. Revolution broke out again in 1832 as a result of the influence of the diplomats and the machinations of the rebels; order was restored by the Austrians. This aroused the jealousy of France, which occupied Ancona in order by this means to force the Papal States to adopt liberal reforms. It was not until six years later that the foreign troops were withdrawn, and a period of peace ensued. Much was done at this time to promote the public welfare. The demand for the separation of the ecclesiastical and the civil administration was however not fulfilled. The new secretary of State, Lambruschini, suppressed all aspirations towards political liberty with extreme severity. He was as a matter of fact only doing what was being done in the majority of European countries, where the authorities also tried to suppress the movement towards liberty by force, though by so doing they only strengthened the opposition. The last three years of Gregory's reign were again occupied by rebellions in the Papal States.

Gregory, who even after becoming pope lived according to the strict rule of his Order, was also opposed to the modern spirit in ecclesiastical matters. In the encyclical of 1843 he condemned false enlightenment, indifferentism and the demand for unbounded religious freedom even as the most pernicious errors. He also condemned the doctrines of Lamennais, Bautin and Hermes, as well as the unorthodox practice followed in Prussia in the case of marriages between Catholics and non-Catholics. The ecclesiastical dispute of Cologne ended in favour of the pope. In England the number of Apostolic vicariates was increased to eight, and a Catholic press (*The Tablet*), was founded in order to dispel the prejudice against Catholics. The Catholic Institute in London, various pious associations and the ten theological training colleges which existed in England in 1846 gave good prospects for the progress of Catholicism in England. The pope encouraged missionary work, forbade the slave trade, and settled a number of disputes on ecclesiastical affairs with various countries.

Gregory XVI. showed his interest in scholarship by instituting museums of Egyptian and Etruscan antiquities in the Vatican and a museum of sculpture in the Lateran. He also encouraged excavation and the preservation of Roman remains. Subscriptions were received from all parts of the world for the rebuilding of the church of S. Paolo fuori le mura, which had been burnt down, and a part of the new structure was ready for consecration by 1840. Scholars such as Cesare Cantù, the historian Angelo Mai and the linguist Giuseppe Mezzofanti enjoyed the favour of the pope.

The revolutionary spirit continued to make progress, and men who had been forced to flee from their own countries owing to their revolutionary activities met in Brussels, Paris and London, where they conspired to raise rebellions in their native lands. One of the chief of these agitators was Giuseppe Mazzini, who, with his free-thinking association *La Giovane Italia,* aimed at overthrowing all monarchical Governments in Italy and setting up a united Italian republic. Outside this powerful movement there were a number of Italian nationalists who were influenced by the Romantic movement and wanted the Italy of the future to be founded on religion and the papacy. Rosmini and Gioberti dreamed of a federation of States under the leadership of the pope, and Balbo of a national federation with Piedmont for its sword and Rome for its heart.

Pius IX., 1846–78: The Revolution of 1848.—The new pope, Pius IX., who was of the Mastai-Ferretti family, was believed to hold nationalist views, and when he broke with the rigid system of government of his predecessor, was at once greeted as the "pope of progress." He proclaimed an amnesty for political offences, relaxed the censorship laws, organized the council of ministers, replaced the mercenary troops by a civic guard, and set up a council of State and a municipal council for Rome, admitting laymen to membership of these bodies. He showed his sincere desire to prepare the way for Italian unity by proposing a customs union between the Italian States. The high-minded pope was however ill rewarded for his liberalism when the Revolutionary year of 1848 arrived. The proclamation of the amnesty had attracted Mazzinists, as well as bandits and other revolutionary elements, to the Papal States, and these gradually undermined the foundations of society. Encouraged by the February Revolution in Paris, certain elements in the Italian States peremptorily demanded that constitutions should be granted. The Papal States, on March 14, 1848, received a constitution setting up a two-chamber system. Not long afterwards the once idolized pope was accused of being a traitor to his country because he refused to take part in the nationalist war of Piedmont against the Austrian rulers. In accordance with the duties of his office he put the universal significance of the papacy above national aspirations, and not only declared his neutrality, but stated that he would never place himself at the head of an Italian confederation. By this decision the Holy See placed itself outside the movement for Italian unity, and the formation of Italy took place in opposition to Rome and to the temporal power of the pope. Revolution was already threatening in Rome. The pope was obliged to flee to Gaëta, and Mazzini's Red Republic, which was proclaimed in Rome in 1849, indulged in disgraceful orgies of anti-religious fanaticism. The triumph was however a brief one. Order was restored by foreign Powers, and Pius returned in 1850.

After the stormy years of 1848 and 1849, the former authorities were restored to their position in Italy as in Germany and Austria, and a new reactionary movement everywhere set in. In view of this it is not surprising that Pius IX., after the experiences which he had gone through, also adopted an anti-constitutional attitude. In this he and his secretary of State Antonelli were partly actuated by their conviction that in the Papal States, where all questions of internal and external policy must necessarily be regarded from the standpoint of the Church, the duties of a head of the State acting with a parliament might come into conflict with the duties of the pope as head of the Church, and the freedom and independence of the papacy might accordingly suffer. The 1848 constitution was not restored, but the pope granted provincial and municipal self-administration. Laymen were allowed a share in the administration, but the final decision in all departments remained in the hands of the higher clergy.

Pius IX. governed without severity, founded charitable institutions, and restored order in the finances, where Mazzini had left a deficit. A really amazing amount of work for the public good was accomplished in the peaceful years which now followed. Rome was provided with a good water supply, streets and squares were improved, and the railway to Frascati was constructed. The pope enriched the Vatican collections with new acquisitions, founded the Christian Museum in the Lateran, and encouraged excavations on the Palatine and at Ostia, as well as the important researches of de Rossi in the catacombs. Many churches were restored, the Damascus Court was altered, and the great marble staircase in the Vatican was constructed during this pontificate.

The Union of Italy.—The basis of the temporal power of the pope was however no longer secure. The Italians were subjected to the most intense national and international propaganda. The principal centre of the movement was at this time the little Liberal State of Piedmont, which now stood forward as the chief representative of the idea of unity, and, supported by France, took up arms against Austria in 1859. The independence of Italy was everywhere proclaimed, and one revolt was succeeded by another. The abolition of the Papal States was one of the points in Cavour's programme, and it was faced with dissolution. It was reduced to one-fifth of its previous area in 1860. In the following year Victor Emmanuel was proclaimed king of Italy, and Cavour, the creator of Italian unity, even as he lay dying, spoke in favour of a free Church in a free State (*libera chiesa in libero stato*). This watchword, together with that of *"Roma capitale,"* were everywhere repeated as the dogma of nationalism. The

Franco-Prussian War of 1870 encouraged the nationalists to take the final step. When the news of Sedan was received, and Italy was no longer obliged to consider the wishes of France, the excitement reached its highest pitch. On Sept. 20 the practically undefended city of Rome, the capital of Christianity, which belongs to all Catholic nations, was occupied by Italian troops. Rome became the capital of Italy. The so-called Guarantee Law of May 13, 1871, conferred on the pope the rights and honours of a sovereign, granted him an annual endowment, and recognized the extra-territoriality of the papal palaces, but these were declared the property of the Italian State, and the pope was only allowed the usufruct of them. An international matter was thus settled by an individual State without any other guarantee. Pius IX. persistently refused the offer made to him, and protested against what he called the usurpation. Both he and his successors, who, like him, refused to go outside the Vatican until the settlement that was reached with the Quirinal in 1929, did not cease to join with Catholic Christendom in protesting against a position imposed by force, which did not provide the necessary guarantees for the complete independence of the supreme head of the Church.

Doctrine.—In the midst of all these difficulties, Pius IX. was extremely active in Church affairs. Eminent men of all nations formed part of the College of Cardinals. New seminaries for Americans were set up in Rome, and new bishoprics were created both in America and in other parts of the world. The Latin Patriarchate in Jerusalem was restored. A Congregation of Cardinals was instituted to deal with the affairs of the religious Orders and their reform. The pope held a number of assemblies of bishops, as for instance in 1854, when he proclaimed the dogma of the Immaculate Conception of the Virgin Mary. The encyclical of 1864, with its condemnation of 80 theses (*Syllabus errorum*), was a reply to the violent attacks of liberalism. The pope uttered a warning against compromise in the struggle between God and the world which was an outstanding feature of the times, since compromise could only lead to the confusion of minds. In opposition to modern irreligious philosophy there grew up the new scholasticism, which aimed at a revival of the metaphysical and theological doctrines of St. Thomas Aquinas.

International Relations.—Pius IX. concluded concordats with a number of States. The concordat with Austria (1855) abolished what still remained of Josephism, but it was abrogated in the liberal era which ensued. Since the end of the Cologne disturbances, there had been a Catholic revival in Germany, and religious associations of various kinds took part in the social development of the day. The so-called *Kulturkampf,* which was instituted by Prussia after the creation of the new empire (1871), and the object of which was to give the State complete control of the Church, met with resistance from the bishops and from the leaders of the Centre Party, who were devout Catholics and rallied staunchly round the pope, who also remained steadfast. The Catholic hierarchy was restored in Holland and also in England, where there were 12 bishoprics and the archbishopric of Westminster.

Papal Infallibility.—The most important ecclesiastical event in the lifetime of Pius IX. was the 20th General Council, the summoning of which in 1869 greatly excited the non-Catholic and diplomatic world. The main subject of discussion was the old and vexed question of papal infallibility. Both within and outside the Council there was keen opposition, sometimes on the doctrine itself and sometimes on the expediency of definition. The abundant literature which grew up on the subject shows that it was considered in all its aspects. All the arguments and counter-arguments were fully and freely discussed in the numerous congregations. Finally, on July 18, 1870, all but two of the 535 ecclesiastics present voted in favour of the dogma that the Roman pope, speaking *ex cathedra,* possesses infallibility for decisions on doctrines affecting faith or morals, in virtue of his supreme apostolic power. This was a deathblow to the old doctrines of Gallicanism and Febronianism, and the authority of ecclesiastical doctrine was established on a firmer basis. The strongest opposition to the doctrine of infallibility existed among the followers of Döllinger in Germany, who, notwithstanding the latter's warning against setting up altar against altar, founded the religious society of the Old Catholics.

Leo XIII., 1878–1903.—The so-called Prophecy of Malachi concerning the popes calls Pius IX. *Crux de cruce,* and his successor Leo XIII., whose reign was also a long one, *Lumen de coelo.* Joachim Pecci—for this was his family name—was a man of acute and farseeing mind, who had received a good training in practical affairs, since he had been Nuncio in Belgium at the time when the ecclesiastical and political tension had been at its height, and Bishop of Perugia during the period of reform. Deeply conscious of his duty to instruct the nations, he issued a number of encyclicals, which were masterpieces of Latin composition, and embodied forcibly expressed ideas on all aspects of the life of the peoples. His Easter encyclical of 1878 dealt with the relation between the Church and civilization in general, and a year later he spoke in praise of St. Thomas Aquinas, for the study of whose doctrine an academy was set up, and whom he called the best leader for a renewal of philosophy. The famous encyclical on labour questions (*Rerum novarum*), issued in 1891, still continues to influence the modern world. It lays down a general programme for modern civilization, and points out that the possessing classes, including the employers, have important moral duties to fulfil, and that it is one of the first duties of society in general, in collaboration with the Church, which stands for reconciliation between the classes by virtue of its doctrine and the spirit of charity which inspires it, and with the State, whose duty it is to pass laws for the protection of the workers, to improve the position of the workers.

It was Leo's object to bring about harmonious collaboration between Church and State, without regard to what form of government was adopted. The latter was a matter which did not concern the Church, so long as nothing was done which was not contrary to justice. Other public utterances of this pope dealt with Social Democracy and freemasonry, the duties of the Christian citizen and the family, and religious questions. As a means of combating the rationalistic tendencies of scholarship, he encouraged the study of the Bible, and he founded several colleges for the Eastern clergy in order to promote unity between the churches. One of his main aims was to attain unity among the various Christian religious communities and Rome, and thus to restore the unity of the Christian faith.

Leo XIII. patronised art and learning to an extent which recalls the Renaissance popes. He was a great admirer of Dante, published his own poems, and founded a College of Literature. One of his greatest acts was to open the Vatican archives to students of all nations and denominations (1880), and the Bibliotheca Leonina was founded for the same purpose. The pope was firmly convinced that the Church had nothing to fear from the investigation of truth, and it was his desire that the fullest light should be thrown on every detail of ecclesiastical and world history. Students of all nations, including England, set up historical schools and research institutions in Rome, and have from that time onwards vied with one another in making use of this inexhaustible mine of knowledge for the advancement of learning. Leo encouraged archaeological and scientific studies, and re-instituted the Vatican observatory. On the artistic side, he rebuilt the apse of the Lateran basilica, and restored the Galleria dei Candelabri and the Borgia apartments.

In his relations with the newly established kingdom of Italy, the State which now contained the Vatican, Leo XIII. remained as a matter of principle in the same attitude as his predecessor, and avoided any official relations with the Quirinal, which was the royal residence. Following the example of Pius IX., he forbade Italian Catholics to take part in elections or to stand for the legislature, and demanded the restoration of the temporal sovereignty of the pope as a guarantee for the free exercise of spiritual power. A number of attempts were made to solve the Roman question, as it was called. But Leo XIII. and his secretary of State Rampolla, who were friends of France, never for a moment entertained the idea of attaining their ends by bringing about a war between the Powers and destroying the unity of Italy. They only considered peaceful methods. Negotiations were

undertaken on the basis of the proposal that the popes, while giving up all further claims, should be granted effective sovereignty over a small territory. France, which was at that time an opponent of Italy, was in favour of an agreed solution; Austria and Germany adopted an attitude of reserve, and Italian Liberalism, which was hostile to the pope, and instituted a celebration of the memory of Giordano Bruno in 1889 by way of demonstration, did everything in its power to prevent an agreement being reached.

Leo XIII. was faced in Germany with the legislation which Bismarck had had adopted in Prussia as a result of the *Kulturkampf*. This legislation, with the severe police regulations and other material means of pressure which it instituted, set up a complete system for the suppression of the freedom of the Church. The pope adopted a moderate and conciliatory attitude, and, with the support of the Catholic population of Germany, succeeded in obtaining the repeal of the legislation against the Church. Leo was appointed arbitrator in the dispute between Germany and Spain concerning the possession of the Caroline islands (1885). He also acted as arbitrator in a number of other cases, and thus renewed the former activities of the popes in international relations. Although he was specially friendly to France, his relations with that country were unsatisfactory, since measures were taken to bring about a complete separation of Church and State. A movement arose in England for union between the Anglican and Roman Churches, but Leo decided in the negative in the controversial question of the validity of the consecration of Anglican clergy.

The pope, who had great diplomatic gifts, endeavoured to establish good relations with all countries. He obtained the institution of a Russian embassy to the Vatican, and even established diplomatic relations with Japan. A council of bishops of all the South American States was held in Rome in 1899. The Catholic hierarchy, which now extended over all parts of the world, was increased by nearly 300 dioceses and vicariates. Leo XIII. was a born ruler, and was inspired as a teacher by abundant knowledge of the world and of life.

THE 20TH CENTURY

Pius X., 1903–14.—The new pope, Giuseppe Sarto, who took the name of Pius X., had no diplomatic experience, but was a shining example of the ideal virtues of a shepherd of souls. His motto was *Instaurare omnia in Christo;* and he addressed himself with determination to the task of fortifying the inner life of the Church in every possible way, and filling both clergy and people with the true spirit of the Gospel. While Leo XIII. had been above all the pope of kings, courts and bishops, Piux X. was the pope of the poor and humble, of the minor clergy and of theology and the practical cure of souls. Before he became pope, while he was bishop of Mantua and patriarch of Venice, he had won universal sympathy by his deeply religious nature and his activity in social and charitable affairs. As a result of what had taken place in the last conclave, when Austria had exercised its veto against the candidature of Cardinal Rampolla, he published two constitutions, which prohibited the exercise of the secular veto and reformed the method of papal elections (1904). He reformed the Roman Curia, laid down rules concerning officials in order to check the evil of patronage, and defined the respective spheres of competence of the Congregations and the various other authorities of the Curia, which had become somewhat vague. There was a reduction of the number of fees charged for various purposes. Rome was redivided into parishes. A reduction was made in the excessive number of seminaries for priests in Italy, and Pius instituted a uniform curriculum for the training of the clergy in theology and ascetic discipline. Like his predecessors, he laid stress on the study of St. Thomas Aquinas and the Bible. The Bible Institute was set up in Rome in 1909; it was organized by Fonck on the most modern scientific principles. The Vatican library and archives were developed on the lines adopted by Leo XIII., and the new picture gallery was created. The Italian bishops were given instructions for the care of ecclesiastical archives and the preservation of monuments. Pius also undertook the reform of Church music, and encouraged the use of the old Gregorian chants.

The pope, as bishop of Rome, frequently preached sermons; he recommended frequent communion as a means of developing spiritual life, and suggested that children should be admitted to communion as early as possible. He carried out a number of liturgical reforms, and laid down rules for the secular and regular clergy, who were instructed to interest themselves in social questions. Pius did important work in connection with the codification of ecclesiastical law. Under his instructions, the rules which remained valid for the present day were extracted in a clear and definite form from the chaotic mass of laws which had accumulated in the course of centuries, some of which no longer corresponded to modern requirements. He did not live to see the completion of this work, the new *Codex iuris ecclesiastici*, but certain of its provisions, including those relating to marriage, were put into force during his life-time.

A great stir was created by the pope's manifesto against modernism (1907). In this he condemned all tendencies, whether in Catholic theology or elsewhere, which aimed at the reform of dogma. He demanded that the clergy and teachers of theology should take a special oath disavowing modernism, a movement which had its headquarters in France and Italy and threatened to cause a weakening of the faith in those countries. Pius was not opposed to the modern historical outlook, and recognized the justification of a development of Church doctrine on the basis of incontrovertible researches; but as the guardian of Catholic dogma he could not allow that the supernatural sources of revealed religion should be deprived of their specifically ecclesiastical character by false evolutionism, and that faith and knowledge should be completely separated from one another.

Pius X. was not greatly interested in political affairs, but he had a valuable helper in this respect in his young and congenial secretary of State, Cardinal Merry del Val. As regards relations with official Italy, the Vatican and the Quirinal gradually established a peaceful *modus vivendi,* although the pope had declared immediately after his election that the Church, as the foundation of Christ, must enjoy full and complete liberty. He qualified the absolute prohibition imposed by his predecessors against the participation of Catholics in political elections, and encouraged the non-political organization "Catholic Action" which aimed at educating the social, civic, moral and religious conscience of the Italian nation. He had much difficulty in his relations with France, "the eldest daughter of the Church," which adopted legislation for the separation of Church and State (1905). He took a decisive part in the new settlement of ecclesiastical conditions. The new Republic of Portugal also carried out the separation of Church and State (1911). In Great Britain the Act of 1909 gave Catholics full equality of rights with members of other denominations.

The last circular issued by Pius X. was an appeal for peace addressed to the Catholics of the world on Aug. 2, 1914. He called on Catholics to pray that the flames of war might be extinguished, and that those who guided the destinies of States might cherish thoughts of peace. The "religious pope," as he has been justly called, died in poverty as he had lived, and is buried in a plain sarcophagus in the vaults of St. Peter's. He is revered by the people as a saint.

Benedict XV., 1914–22: The World War.—The archbishop of Bologna, Giacomo della Chiesa, known as Pope Benedict XV., was the great and distinguished priest-diplomatist in whom was brilliantly personified the mediaeval ruler's ideal—"Justitia et Pax" (justice and peace). From his exalted non-party position and with his spiritual authority over all nations, he left no stone unturned in his endeavours to arrest the appalling war spirit. He characterized as the four fundamental evils—and the reason for the severe disturbance of the orderly state of human society—the want of kindly love in the relations of mankind with one another, the contempt of authority, the iniquitous warfare of ranks and classes, the greedy hankering after transitory and perishable possessions. These evils must be uprooted, and only moreover by bringing once more into esteem the fundamental principles of Christianity. This pious pope composed an indi-

vidual prayer for peace, and proposed to the combatant nations a truce for Christmas 1914. Again and again, he exhorted them to desist from this mutual destruction mania, and to realize that nations do not die out, and that therefore rulers should weigh the rights and lawful aspirations of nations by direct or indirect exchange of opinion; for balance of power in the world depends much more on mutual well-wishing and on respect of the rights of others than on the number of men under arms, and on the strength of fortresses. The message of Benedict XV. of Aug. 1, 1917 to the heads of the States of the combatant nations constituted the climax of the papal efforts for peace. In this "as the father of all, who loves all his children with equal affection" he proposed an honourable peace for all, whose durability would be guaranteed if the moral strength of justice were to take the place of the material strength of weapons, and international disputes were submitted to arbitration. At the same time this "pope of peace" accomplished deeds of the sublimest charity. Through his intercession he ameliorated the lot of the prisoners of war, the wounded and the sick; he collected alms throughout the world with the zeal of a Franciscan mendicant friar for the poor and needy, irrespective of nationality and religion. In the midst of the tumult of war, the new book of Church laws, begun under Pius X. was completed (1917), in which the common laws of the Church are lucidly comprised in one. As a supporter of missionary affairs, Benedict emphasized in the great Encyclical Letter of 1919 the common missionary duty of all members of the Catholic Church—of the bishops, of the priests, of the laity, and he established a training centre for the oriental Church in conjunction with the Oriental Institute in Rome, for the education of a home-trained mission clergy. The war situation hindered the pope in free intercourse with the world. Against this ignoble situation, which arose from the want of an individual territorial property, he entered a protest, and demanded a solution of the so-called Roman question, which should guarantee the Holy See complete independence of all temporal power.

Pius XI., 1922.—Pope Pius XI. was born on May 31, 1857 in Desio near Milan and was ordained on Dec. 20, 1879 in the Lateran Basilica in Rome. As head of the Ambrosian Library in Milan and of the Vatican Library, he gained the reputation of a brilliant scientific organizer and of a distinguished scholar, honoured by all the world of culture. In addition to this, he was zealously active in the cure of souls. His love of nature led him in the summer holidays to the mountains where he sought bodily and spiritual refreshment. As apostolic visitor and subsequently papal nuncio in Poland, he gave proof of supreme impartiality and justice in the face of difficult conditions. Appointed cardinal archbishop of Milan in 1921 he managed this most difficult and biggest of Italian dioceses with inspired ability and with wise comprehension of the Church needs of a great modern city. These many-sided gifts, in addition to his eminent knowledge of languages, his clear penetrating discernment, his strong simple character and his high ideal conception of the priesthood, made Achille Ratti appear more suitable than any other to mount the papal throne. His election on Feb. 6, 1922 called forth universal satisfaction.

With the words "Pius is a name of Peace, therefore I will bear it," Pius XI. began his rule, among the signs of the rebuilding of Europe after the prodigious shock of the World War. It is not as yet possible to judge this pontiff conclusively in his world historical significance. He is a specially keen supporter of all scientific movements, and devotes his whole vigorous authority to the drawing together again and reconciliation of the nations. The mighty influx of pilgrims from all the world to Rome in the Holy Year 1925, to whom the pope delivered impressive addresses in the familiar languages of their native countries, showed forcefully what unique prestige, what undisputed moral and cultural weight the papacy has in all States and Nations. This is also demonstrated by the standing of the Diplomatic Corps at the Vatican, which since the beginning of the World War to 1928 has increased from 16 to 28 members.

The year 1929 brought the successful solution of the Roman question, an event of world historical importance, whereby the pope regained his complete liberty as an independent sovereign. (I. P. D.)

The Renewal of Papal Sovereignty.—The aspiration of Pius XI. for "the drawing together again and reconciliation of the nations" bore historic fruit seven years after his holiness first assumed the papal tiara.

Mussolini had, in 1926, expressed the wish that a solution of the conflict between the Italian State and the Vatican should be arrived at, a wish that was communicated to Pius XI., which found a favourable reception in that quarter. Unofficial, semi-official and, eventually, official negotiations followed during the years 1927 and 1929, but were kept strictly secret. The councillor of State, Signor Barone, acted as the Italian representative, Monsignor Borgongini Duca and Signor Pacelli as representatives of the pope. although in the last phase, after Signor Barone's death, the negotiations were conducted by Mussolini and Cardinal Gasparri, with Signor Pacelli as the sole intermediary. It was not until Jan. 1929 that rumours of an imminent solution of the "Roman Question" began to circulate. On Feb. 7 Cardinal Gasparri informed the Diplomatic Corps accredited to the Holy See, expressly summoned by him, that an agreement had been concluded and was about to be signed.

Mussolini's goodwill and powers of translating visions into facts, combined with the pope's definite aspiration for peace and concord at home and abroad, united to bring about a great and historic event, which happened with dramatic suddenness on Feb. 11. At noon on that day a treaty was executed at the palace of the Lateran in Rome by which Pius XI. became sovereign of a newly-created State, "The City of the Vatican." Three documents were signed, respectively, for the high contracting parties by Cardinal Gasparri, papal secretary of State, and Mussolini. The treaty, concordat and financial convention, which had to receive the ratification of the king of Italy and the supreme pontiff within four months from the signature, took effect from the moment of ratification.

The political treaty between Italy and the Holy See consists of a preamble and 27 articles. It recognizes the full property, exclusive dominion and sovereign jurisdiction of the Holy See over the Vatican as at present constituted, and for this purpose "The City of the Vatican" is constituted, in which there can be no interference by the Italian Government. The boundaries of the Vatican city are indicated in the map annexed to the treaty. The Vatican city is endowed by the Italian Government with various public services. Territorial immunities are provided for the patriarchal basilicas, and certain edifices outside the Vatican city in which the Holy See houses its congregations and offices. Also the right of the Holy See to send its own diplomatists to foreign countries, and receive foreign diplomatists according to the general rules of international law, is recognized by Italy.

It is also declared that the Vatican wishes to remain, and will remain, extraneous to the temporal competitions between other States, as well as international congresses convened for this purpose, unless the parties in conflict appeal unanimously to its mission of peace, and reserves the full right, in any case, to the exercise of its moral and spiritual power. In consequence thereof the Vatican territory will always be considered neutral and inviolable.

The following declaration is of supreme importance to future historians:—"The Holy See considers that with the agreements signed to-day it possesses the guarantees necessary to provide due liberty and independence to the spiritual government of the dioceses of Rome and of the Catholic Church in Italy and the whole world. It declares the Roman question definitely and irrevocably settled and therefore eliminated, and recognizes the kingdom of Italy under the dynasty of the house of Savoy with Rome as the capital of the Italian State. Italy on its side recognizes the State of the Vatican city under the sovereignty of the supreme pontiff. The Law of Guarantees and any other law or act contrary to the present treaty is abrogated."

For the article in the Concordat which concerns Italy and the Canon law, and the question of religious instruction, *see* ITALY.

According to the financial convention, the Holy See, as a definite

settlement of all its financial relations with Italy, in consequence of the loss of its temporal power in 1870, accepts 750,000,000 lire (£8,152,000) in cash and 1,000,000,000 lire (£10,869,000) in Italian State bonds bearing interest at 5%. This sum is less than what Italy would have paid if the Holy See had accepted the allowance offered under the Law of Guarantees of May 13, 1871.

On the day following the signing of the treaty, Pius XI. appeared on the balcony of St. Peter's and gave the pontifical blessing, *Urbi et Orbi,* in the presence of some 100,000 people gathered in the square, amidst scenes of unprecedented enthusiasm.

Commenting on this historic event, *The Times* (Feb. 13, 1929) said:—"It is a great fact in the history of the Roman Church and of United Italy, now for the first time invested with a complete religious unity in the minds of all her Catholic citizens. . . . With the signal courage and breadth of view which have led him to carry out this great work of peace, the pope assumes the whole responsibility for his departure from the course followed by his predecessors for almost 60 years. He declares that the only aid he has had during his long study of what until two days since was still the 'Roman Question' has been from the prayers of the faithful of his communion. . . . The credit of the initiative is assigned to Signor Mussolini, but he must have known that in the pope, whose first act was to bless the people from the outer loggia of St. Peter's he would find a ready listener. . . . The pontifical banner and the flag of United Italy flew side by side on St. Peter's yesterday. In the words of the governor of Rome, 'what seemed to be a poet's dream' has indeed 'become a splendid reality.'"

On March 9, the pope received the entire diplomatic corps accredited to the Holy See to receive from them the congratulations of the nations of the world on the settlement of the "Roman Question" by the Lateran Treaty. More than seventy diplomats representing about thirty-five countries assembled before his holiness in the throne room.

In his reply the pope declared that the diplomatists' visit was "truly the greatest and the most important that could be made to us. For behind each one of you, we cannot prevent ourselves from seeing your respective State leaders, kings, presidents, regents, or by whatever other name they are called, and with them your peoples and your countries. . . . The sympathy and union of your countries and peoples at a moment (or, it can be said, a turning point) so important in the history of the Holy See and the Church, are translated into such solemn demonstrations that they have replaced and surpassed without measure all the guarantees which we could have desired." His holiness went on to refer to "another guarantee, which since February 11 has been filling the entire world. That is this great, incomparable (and perhaps up till now unprecedented) plebiscite, not only of Italy, but of all parts of the world. There is no exaggeration in these words: we have received letters and dispatches not only from all the towns and villages of Italy, not only from all the towns and many of the villages of the countries of Europe, but also from the two Americas, from India, from China, from Japan, from Australia, from New Zealand, from Northern, Central and South Africa, from Alaska, from the Mackenzie, from the Hudson, as if it all concerned a local affair. What an impressive event, and one which authorizes us to state, that not only the people, but that the peoples of the entire world are with us; a true plebiscite, not only national, but world-wide. And there is the most imposing guarantee that can be thought of or imagined."

We are too close to the big fact to appreciate it in its full importance and significance, and cannot even guess at its repercussive effects throughout the world. It has been expressly declared that the Vatican city State "will remain extraneous to the temporal competitions between other States," and that "it will only endeavour to fulfil its mission of peace if invited to do so." The Vatican will therefore not apply for admission to the League of Nations, as membership of that body would involve military obligations which a spiritual Power such as the Holy See could not undertake. The temporal power of the Holy See, as the world reckons temporal power, is hardly more than the palpable assertion of a right, when the insignificant size of the new State is considered. All that the pope asked for and received was "what was indispensable to true sovereignty and necessary for his spiritual ministry."

This, taken in conjunction with the statement in the preamble of the treaty, that the two high contracting parties recognize the advisability of eliminating every reason for enmity between them, may be seen to be something more than a magnificent gesture towards international concord. It is the greatest attempt made in the present generation to reinforce the moral health and happiness of the world, because it contains the potentialities by which "the peace of Christ in the Kingdom of Christ" can be forwarded.

(X.)

*List of the Pontiffs of the Roman Church**

BIBLIOGRAPHY —General —Of encyclopaedias may be mentioned G. Moroni, *Dizionario di erudizione storico-ecclesiastica* (103 vols, Venice, 1840–79), H J Wetzer and B Welte, *Kirchenlexikon* (2nd ed, 12 vols, Freiburg-im-Breisgau, 1882–1901), *The New Schaff-Herzog Encyclopedia* (edit. P. Schaff and J. J. Herzog, 1908, etc), which presents in a condensed form that great body of Protestant learning, the *Realencyklopadie fur protestantische Theologie und Kirche* (edit J J. Herzog, 1854–66; 3rd ed, A Hauck, Leipzig, 1896, etc); *The Catholic Encyclopaedia* (edit. C. E Herbermann, 16 vols, 1907–14); *The Encyclopaedia of Religion and Ethics* (edit J. Hastings, 1908–25), all of which contain articles on individual popes and subjects connected with the papacy, with bibliographies *See* also the separate bibliographies to the articles on individual popes. For chronological detail *see* Z. V Lobkowitz, *Statistik der Papste* (Freiburg-i-B, 1905). Carefully indexed source materials in the original languages are given by C Mirbt, *Quellen zur Geschichte des Papsttums und des romischen Katholizismus* (3rd ed, Tubingen, 1911). J T. de Rocaberti, *Bibliotheca Maxima Pontificia* (21 vols, Rome, 1698–99) is a collection of more than a hundred authors, from the 9th to the 17th century, dealing with the primacy; A de Roskovány, *Romanus Pontifex* (5 vols, Neutra, 1867), a collection of documents with an inclusive bibliography For Church histories *see* F X Funk, *Lehrbuch der Kirchengeschichte* (5th ed, Paderborn, 1907, Eng trans, P Perciballi, *A Manual of Church History*, 2 vols, 1914); A Knopfler, *Lehrbuch der Kirchengeschichte* (6th ed, Freiburg-i-B, 1920), both Catholic, also the Lutheran work of J. H. Kurtz, *Lehrbuch der Kirchengeschichte* (edit. N. Bonwetsch and P. Tschackert, 14th ed., Leipzig, 1906; trans J. Macpherson, *Church History*, 3 vols. 1888). *See* also L. von Ranke, Fürsten und Völker von *Sud-Europa* (vols. ii. to iv, 1837), Eng trans. as a separate book by D. D. Scott, *The Popes of Rome in the 16th and 17th Centuries* (1846); L. F A. von Pastor, *Geschichte der Päpste seit dem Ausgang des Mittelalters* (Freiburg-i-B, 1886–89), Eng. trans. edit F. I. Antrobus, *The History of the Popes from the End of the Middle Ages* (14 vols, 1891–1924); H. K. Mann, *The Lives of the Popes in the Early Middle Ages* (13 vols., 1902–25), W. Barry, *The Papal Monarchy from St. Gregory to Boniface VIII.* (1902); J. Turmel, *Histoire du Dogme de la Papauté* (1908); M I. M. Bell, *A Short History of the Papacy* (1921); also F Gregorovius, *History of the City of Rome in the Middle Ages* (trans from the 4th German ed. by A. Hamilton, 8 vols., 1900–09); *The Cambridge Medieval History* (edit. J. B. Barry, etc, 1911–26), and *The Cambridge Modern History* (edit. A W. Ward, 1902–10)

Period I. To 1087:—For a selected list of books on the history of the papacy during the first eleven centuries, *see* the bibliography to the article CHURCH HISTORY. *See* also E. Loning, *Geschichte des deutschen Kirchenrechts* (2 vols., Strassburg, 1878); A. von Harnack, *Lehrbuch der Dogmengeschichte* (3 vols., 1885–90; 6th ed, Tubingen, 1922), Eng. trans, N. Buchanan, *History of Dogma*, vol i. (1894); R. Sohm, *Kirchenrecht*, vol. i. (1892); L. Duchesne, *Les premiers temps de l'état pontifical* (1904) and *Eglises separées* (1905), Eng. trans, A A. Mathew, *The Churches Separated from Rome* (1907); W. E. Beet, *The Early Roman Episcopate to A D. 384* (1913); A. K. Fortescue, *The Early Papacy to the Synod of Chalcedon* (1920). *See* also articles on individual popes.

Period II (*a*.) From 1087 to 1124:—L. Paulot, *Un Pape français, Urbain II.* (1903); M. F. Stein, *Zur Biographie des Papstes Urbans II.* (1883). On Pascal II. *see* E. Franz, *Papst Paschalis II.* (Breslau, 1877), W. Schum, *Die Politik Papst Paschals II. gegen Kaiser Heinrich V. im Jahre 1112* (Erfurt, 1877), and B. Monod, "Étude des relations entre le Saint-Siège et le royaume de France, de 1099 à 1108" in the *Positions des thèses des élèves de l'École des Chartes* (1904), M. Maurer, *Papst Calixt II.* (Munich, 1889), V. Robert, *Histoire du pape Calixte II.* (1891) and *Bullaire du pape Calixte II.* (1891) Besides these monographs, useful information on the history of the popes of the period will be found in Ernst Bernheim, *Zur Geschichte des Wormser Konkordates* (Gottingen, 1878), H Hagenmayer, *Peter der Eremit* (Leipzig, 1879), H. von Sybel, *Geschichte des ersten Kreuzzugs* (2nd ed, Leipzig, 1881); M Rule, *The Life and Times of St. Anselm* (2 vols., 1883); G Meyer von Knonau, *Jahrbucher des deutschen Reiches unter Heinrich IV. und Heinrich V* (Leipzig, 17 vols, 1890–1909), C. Mirbt, *Die Publizistik im Zeitalter Gregors VII.* (Leipzig, 1894); R Rohricht, *Geschichte des Konigreichs Jerusalem* (Innsbruck, 1898) and *Geschichte des ersten Kreuzzuges* (1901); F. Chalandon, *Essai sur le règne d'Alexis I. Comnène* (1900)

(*b*.) From 1124 to 1198 —*See* H. Reuter, *Geschichte Alexanders III. und der Kirche seiner Zeit* (3 vols, 1860–64), G Kleemann, *Papst Gregor VIII, 1187* (1912); J. Geyer, *Papst Klemens III, 1187–1191* (vol vii. of *Jenaer historische Arbeiten*, 1914), A Eggers, *Die Urkunde Papst Hadrians IV. fur Konig Heinrich II. von England uber die Besetzung-Irlands* (1922); M E. Almedingen, *The English Pope, Adrian IV* (1925). Much information on the policy of these popes will be found in the works on the great personages of the time: J. Ficker, *Reinald von Dassel* (Cologne, 1850); P Scheffer-Boichorst, *Kaiser Friedrichs I letzter Streit mit die Kurie* (1866); Th Toeche, *Kaiser Heinrich VI.* (Leipzig, 1867), H Prutz, *Kaiser Friedrich I.* (3 vols, Danzig, 1871–74), F. von Raumer, *Geschichte der Hohenstaufen und ihrer Zeit* (5th ed, 6 vols, Leipzig, 1878), W Bernhardi, *Lothar von Supplinburg* (Leipzig, 1879) and *Konrad III.* (1883); J. Thiel, *Die politische Thatigkeit des Abtes Bernhard von Clairvaux* (Konigsberg, 1885); K Norgate, *England under the Angevin Kings* (1887); A. Hausrath, *Arnold von Brescia* (Leipzig, 1891); D Hirsch, *Studien zur Geschichte Konig Ludwigs VII. von Frankreich* (Leipzig, 1892), A. Luchaire, *Louis VII, Philippe-Auguste, Louis VIII.* (vol. iii, pt 1, of E Lavisse, *Histoire de France*, 12 vols, 1893–1901); F. Vacandard, *Vie de S. Bernard* (2 vols, 1895); J Jastrow and G. Winter, *Deutsche Geschichte im Zeitalter der Hohenstaufen* (2 vols, 1897–1901), O Cartellieri, *Abt Suger von Saint-Denis* (1898), H. Bohmer, *Kirche und Staat in England und in der Normandie im XI. und XII. Jahrhundert* (Leipzig, 1899), and P Scheffer-Boichorst, "Hat Papst Hadrian IV. zu Gunsten des englischen Konigs uber Irland verfugt?" in *Mitteilungen des Instituts fur osterr Geschichtsforschung* (supplementary vol iv, 1893).

(*c*) From 1198 to 1261 —On the pontificate of Innocent III in general, *see* F von Hurter, *Geschichte Innocenz III.* (3rd and 2nd ed, 4 vols, Hamburg, 1841–44), and A Luchaire, *Innocent III, Rome et l'Italie* (2nd ed, 1905), *Innocent III, la croisade des albigeois* (1905), *Innocent III, la papauté et l'empire* (Paris, 1906), *Innocent III, la question d'orient* (1906), and *Innocent III, les royautés vassales du Saint-Siège* (1908). *Cf* E. Winkelmann, *Philipp von Schwaben und Otto IV. von Braunschweig* (2 vols, Leipzig, 1873–78), W. Norden, *Das Papsttum und Byzanz* (1903), a considerable part of which is devoted to Innocent III, E Gerland, *Geschichte des lateinischen Kaiserreiches von Konstantinopel* (Hamburg, 1905), R Davidsohn, *Philipp II. August von Frankreich und Ingeborg* (Stuttgart, 1888); R Schwemer, *Innocenz III. und die deutsche Kirche wahrend des Thronstreites von 1198–1208* (Strassburg, 1882); Else Gutschow, *Innocenz III. und England* (Munich, 1904); and many other detailed monographs The pontificate of Honorius III. is dealt with by J Clausen in his *Papst Honorius III* (Bonn, 1895), and his registers have been published by P Pressutti (3 vols, Rome, 1884 and 1888–95). On Gregory IX, *see* J Felten, *Papst Gregor IX* (Freiburg-i-B., 1886); P. Balan, *Storia di Gregorio IX e dei suoi tempi* (3 vols, Modena, 1872–73); and J. Marx, *Die vita Gregorii IX.* (1889). The publication of the registers of this pope was begun by L. Auvray in the *Bibliothèque des écoles de Rome et d'Athènes* (Paris, 1890 *et seq*). On Innocent IV., *see* E Berger, *St Louis et Innocent IV.* (1893); E Winkelmann, *Kaiser Friedrich II* (2 vols, Leipzig, 1889–97); P Aldinger, *Die Neubesetzung der deutschen Bistümer unter Papst Innocenz IV.* (Leipzig, 1901); C Rodenberg, *Innocenz IV. und das Konigreich Sizilien* (Halle, 1892), and F. Tenckhoff, *Papst Alexander IV.* (1907). The publication of the registers of Innocent IV. was undertaken by Elie Berger (1881–1919), and those of Alexander IV by J de Loye, A Coulon and C. Bourel de la

Roncière (1895, etc.). As the history of the later Hohenstaufens is intimately bound up with that of the contemporary popes, mention must be made of F. W. Schirrmacher, *Die letzten Hohenstaufen* (Göttingen, 1871); A. Karst, *Geschichte Manfreds vom Ende Friedrichs II. bis zu seiner Krönung* (1897); and K. Hampe, *Geschichte Konradins von Hohenstaufen* (Innsbruck, 1894).

(*d*) From 1261 to 1305:—L. Dorez and J. Guiraud, members of the French school at Rome, began the publication of the registers of Urban IV. (1892, etc.); E. Jordan, those of Clement IV. (1893, etc.); and J. Guiraud and L. Cadier, those of Gregory X. (1892, etc.). On Gregory X., *see* F. Walter, *ie Politik der KDurie unter Gregor X.* (Berlin, 1894). The pontificate of John XXI. has been dealt with by R. Stapper, *Papst Johannes XXI.* (Münster-i.-W., 1898), and that of Nicholas III. by A. Demski, *Papst Nikolaus III.* (Münster-i.-W., 1903), in vol. vi. of the *Kirchengeschichtliche Studien*, edit. by Knöpfler, Schrörs and Sdralek. The publication of the registers of Nicholas III. was undertaken by J. Gay (1898, etc.). Much information on the policy of these popes will be found in the following: R. Sternfield, *Ludwigs des Heiligen Kreuzzug nach Tunis und die Politik Karls I. von Sizilien* (1896); Ch. V. Langlois, *Le Règne de Philippe III. le Hardi* (1887); L. Leclère, *Les Rapports de la papauté et de la France sous Philippe III.* (Brussels, 1889); C. Minieri-Riccio, *Alcuni fatti riguardanti Carlo I. d'Angiò* (Naples, 1874), and *Il Regno di Carlo I. d'Angiò*, in the *Archivio storico italiano* (3rd series, vols. xxii., xxiii., xxiv., xxv., xxvi.: 4th series, vols. ii., iii., iv., v., vii., 1875–81); A. Busson, *Die Idee des deutschen Erbreichs und die ersten Habsburger* (Vienna, 1878); G. del Giudice, *La Famiglia di re Manfredi* (Naples, 1880); and H. Otto, *Die Beziehungen Rudolfs von Habsburg zu Papst Gregor X.* (Innsbruck, 1895). There is a good account of the policy of Martin IV. in O. Cartellieri, *Peter von Aragon und die sizilianische Vesper* (Heidelberg, 1904). On Honorius IV., *see* introduction to the complete edition of his registers by Maurice Prou (1886–88). E. Langlois has published the registers of Nicholas IV. (1886–93), and Otto Schiff deals with his pontificate in his *Studien zur Geschichte Papst Nikolaus IV.* (1897). On Celestine V., *see* H. Schulz, *Peter von Murrhone: Papst Coelestin V.* (1894). The publication of the registers of Boniface VIII. was begun by G. Digard, M. Faucon and A. Thomas (1884). Of the vast literature on this pontificate we must content ourselves with citing: Heinrich Finke, *Aus den Tagen Bonifaz' VIII.* (Münster-i.-W., 1902); Ch. V. Langlois, "St. Louis, Philippe le Bel, Les Derniers capétiens directs" (vol. iii., pt. 2 of Lavisse, *Histoire de France*); Ernest Renan, *Études sur la politique religieuse du règne de Philippe le Bel* (1889); A. Baudrillart, "Des idées qu'on se faisait au XIV^e siècle sur le droit d'intervention du souverain pontife en matière politique," in the *Revue d'histoire et de littérature religieuses* (vol. iii., 1898); and R. Holtzmann, *Wilhelm von Nogaret* (Freiburg-i.-B., 1898). The pontificate of Benedict XI. is dealt with by P. Funke in his *Papst Benedikt XI.* (Münster-i.-W., 1891). *See* Ch. Grandjean, "Recherches sur l'administration financière du pape Benoît XI.," in the *Mélanges d'archéologie et d'histoire* (vol. iii., 1883), published by the French school at Rome. Grandjean has published the registers of Benedict XI. (1883).

Among works of a more general character that throw light on the history of the papacy during the 12th and 13th centuries, the first place must be given to Walter Norden, *Das Papsttum und Byzanz. Die Trennung der beiden Mächte und das Problem ihrer Wiedervereinigung bis zum Untergange des byzantinischen Reichs* (Berlin, 1903), which contains an account of the question of the East in its relations with the papal policy, from the rise of the schism down to the end of the middle ages. *See* also Félix Rocquain, *La Papauté au moyen âge* (1881) and *La Cour de Rome et l'esprit de réforme avant Luther* (3 vols., 1893–97); J. B. Sägmüller, *Die Thätigkeit und Stellung der Cardinäle bis Papst Bonifaz VIII.* (Freiburg-i.-B., 1896); and A. Gottlob, *Die päpstlichen Kreuzzugssteuern des 13. Jahrhunderts* (Heiligenstadt, 1892) and *Kreuzablass und Almosenablass* (Stuttgart, 1906).

Period III. 1305–1590:—E. Baluze, *Vitae paparum avenioniensium, 1305–1394* (1693); Raynaldus, *Annales eccles. ab anno 1198* [to 1565] annotated and added to by J. O. Mansi (15 vols., Lucca, 1747–56); J. O. Mansi, *Conciliorum collectio* (1759–1870); Theodericus of Niem, *De schismate* (edit. G. Erler, 1890); J. B. Christophe, *Histoire de la papauté* (1873); C. J. von Hefele, *Conciliengeschichte* (Freiburg-i.-B., 1855–90); C. A. C. von Höfler, *Die avignonesischen Päpste* (1871); M. Creighton, *History of the Papacy* (1882–94; 2nd ed., 6 vols., 1897); L. von Pastor, *Geschichte der Päpste* (Freiburg-i.-B., 1886–89); and *Acta pontificum* (1904, etc.); N. Valois, *La France et le grand schisme* (4 vols., 1896–1902); J. Haller, *Papsttum und Kirchenreform* (1903). For the Papacy in connection with the Renaissance, *see* E. Müntz, *Les Arts* (1892); J. Voigt, *Wiederbelebung des Klassischen Altertums* (1893); J. Burkhardt, *Cultur der Renaissance in Italien* (2 vols., edit. L. Geiger, 1907). For the palace at Avignon, *see* F. Ehrle, *Historia Bibliothecae Romanorum Pontificum* (vol. i., 1890).

To the authorities for the lives of individual popes, and to the articles on the Councils of Basel, Constance, Trent, may be added: Clement V.: E. Boutavi, *Philippe le Bel* (1861); L. König, *Päpstl. Kammer unter Clemens V. und Johann XXII.* (1894); H. Finke, *Acta Aragonen* (1908). John XXII.: J. F. Böhmer, *Regesta Ludwigs des Baiern* (1839); *Vatikanische Acten* (1891); S. Rieyber, *Litevarische Widersacher* (1874); C. F. F. Müller, *Ludwigs Kampf mit der Curie* (2 vols., 1879–80); A. Coulon, *Lettres sociétés de Jean XXII.* (1907); G. Mollat, *Lettres commun. de Jean XXII.* (vols. i.–iv., 1907); Clement VI.: E. Werunsky, *Kaiser Karl IV.* (vols. i. and ii., 1882–86); F. Papencordt, *Cola de Rienzo* (1841); E. Déprez, *Lettres closes de Clement VI.* (1901). Innocent VI.: E. Werunsky, *Ital. Politik Innoc. VI. und Karl IV.* (1878), *Karl IV.* (vols. ii. and iii., 1886–92); J. P. Kirsch, *Kollectorien* (1892); G. Daumet, *Innocent VI. et Blanche de Bourbon* (1899). Urban V.: J. B. Magnan, *Urbain V.* (1863); E. Werunsky, *Karl IV.* (vol. iii., 1892); M. Piou, *Relations politiques avec les rois de France* (1888); H. J. Wurm, *Albornoz* (1892); J. P. Kirsch, *Rückkehr der Päpste Urban V. und Gregor XI. nach Rom.* (1898). Gregory XI.: J. P. Mirot, *Rétour du St. Siège à Rome* (1899); N. Tommaseo, *Lettere di S. Caterina* (1860); M. A. Mignaty, *Catherine de Sienne* (1886). Boniface IX.: *Vita* (in L. A. Muratori, *Rerum Italicarum Scriptores*, vol. iii., 2; 25 vols., edit. F. Argellati, 1723–51); *Cosmodromium* (edit. J. Jansen, 1900), and J. Jansen, *Bonifacius IX. und die deutsche Kirche* (1904). Innocent VII.; Gregory XII., schismatic popes, Council of Constance, etc. *Monumenta concil. gen. sacr. XV.* (1857–96); Martin Alpartily, *Chronica* (edit. F. Ehrle, 1906). Martin V.; *Vitae* (*see* Muratori, above, vol. iii., 2); E. von Othenthal, *Bullenregister Martins V. und Eugens IV.* (1885). Eugenius IV.: *Vita* (*see* Muratori); N. PAPAGO, a tribe in Arizona and Sonora, closely related to the Pima, from whom they differed chiefly in a more scattered mode of life due to a stringently arid habitat. Their chief means of subsistence has always been agriculture. Formerly their chief crops were maize, beans, and cotton, which they cultivated by irrigation, but which have now been replaced by wheat and cotton. More or less under the influence of Jesuit and Franciscan missionaries for over two centuries, they have maintained much of their old life and religion. In 1921 those in southern Arizona numbered 6,100.

PAPAL STATES: *see* States of the Church.

PAPAVERINE, an opium alkaloid still used in medicine to some extent; it was first obtained by Merck in 1848. Papaverine, $C_{20}H_{21}O_4N$, crystallizes in colourless prisms or needles, melts at 147° C, and is optically inactive. It is insoluble in water, but dissolves readily in chloroform or hot alcohol. The hydrochloride, $C_{20}H_{21}O_4N,HCl$, crystallizes in plates and melts at 231° C. On gentle oxidation papaverine is converted into papaveraldine, which is the minor alkaloid *xanthaline* found in opium. Papaverine is an important primary product for the synthesis of alkaloids (*q.v.*). It was first synthesized by Pictet and Gams (1909), and had been converted into laudanosine by Pictet and Athanasescu (1900), from which in turn glaucine was made by Gadamer (1911). The papaverine structure is equally important as a starting point for syntheses in the berberine series.

PAPAW-TREE (*Asimina triloba*), a North American shrub or low tree of the custard-apple family (Anonaceae), native to rich soil from western New York to Nebraska and southward to Florida and Texas. It grows from 10 to 40 ft. high, with large leaves, sometimes 12 in. long and 6 in. wide, and brown to dark red flowers, 1 to 2 in. across. The fleshy, somewhat banana-shaped edible fruit, 2 to 5 in. long, matures in autumn.

PAPAYA (*Carica Papaya*), called also papaw, a small, very soft-wooded tree of the family Caricaceae, native to tropical America and cultivated in most tropical countries. In the United States it thrives in southern Florida below Palm Beach, but it does not succeed well in California, although it is sparingly grown in the hot interior valleys. A rich loamy soil is best. It grows 25 ft. high, without lateral branches, but sometimes divided into several upright stems terminating in clusters of leaves. Most of the plants have either male or female blossoms, only a few have both kinds. The fruits resemble golden yellow melons, are angular, spherical or cylindrical in shape, and attain a weight of 20 pounds. In Florida they ripen from December to June. They are used mostly as a breakfast melon in hot countries, but also as a salad. In some localities the green fruits are cooked and served like summer squash. The milky juice contains papain, a digestive enzyme resembling animal pepsin. This is used as a remedy for dyspepsia.

PAPEETE, capital of Tahiti: *see* Pacific Islands.

PAPEL, a Portuguese Guinea people, related to the Bagnun, Balante, Mandjak and Bola peoples, living on the left bank of the Geba estuary.

See Dr. Maclaud, "Distribution des races sur la Côte Occidentale d'Afrique," *Bulletin Géogr. hist. descript.* (1906).

PAPENBURG, a town in the Prussian province of Hanover, 27 m. by rail S. by E. of Emden, and near the right bank of the Ems, with which it is connected by a canal 3 m. long. Pop. (1925) 9,444. Papenburg, founded in 1675, became a town in 1860.

PAPER, the general name for the substance commonly used for writing upon, or for wrapping things in (Fr. *papier* through Lat. from Gr. *πάπυρος. See* the article Papyrus). The art of making paper from fibrous matter appears to have been practised by the Chinese at a very distant period. Different writers have traced it back to the 2nd century B.C. Paper first became available for the rest of the world in the middle of the 8th century. In 751 the Arabs, who had occupied Samarkand early in the century, were attacked there by Chinese. The invasion was repelled by the Arab governor, who in the pursuit, it is related, captured certain prisoners who were skilled in paper-making and who imparted their knowledge to their new masters. Hence began the Arabian manufacture, which rapidly spread to all parts of the Arab dominions. The extent to which it was adopted for literary purposes is proved by the comparatively large number of early Arabic mss. on paper which have been preserved dating from the 9th century. The material of the Arab paper was apparently substantially linen. It seems that the Arabs, and the skilled Persian workmen whom they employed, at once resorted to flax, which grows abundantly in Khorasan, as their principal material, afterwards also making use of rags, supplemented, as the demand grew, with any vegetable fibre that would serve; and that cotton, if used at all, was used very sparingly. Paper of Oriental manufacture in the middle ages was usually distinguished by its stout substance and glossy surface, and was devoid of water-marks.

Paper was probably first brought into Greece from Asia. There is a record of its use by the empress Irene at about the end of the 11th century, but with one doubtful exception, there are no extant Greek mss. on paper before the middle of the 13th century.

Paper in Europe.—The manufacture of paper in Europe was first established by the Moors in Spain in the middle of the 12th century, the headquarters of the industry being Xativa, Valencia and Toledo. But on the fall of the Moorish power the manufacture, passing into the hands of the less skilled Christians, declined in the quality of its production. In Italy also the art of paper-making was no doubt established through the Arab occupation of Sicily. But the paper which was made both there and in Spain, was in the first instance of the Oriental quality. In the laws of Alphonso of 1263 it is referred to as cloth parchment, a term which well describes its stout substance. The first mention of rag-paper occurs in the tract of Peter, abbot of Cluny (A.D. 1122–1150), *adversus Iudaeos*, cap. 5.

A few words may here be said respecting mss. written in European countries on Oriental paper or paper made in the Oriental fashion. The oldest recorded document on paper was a deed of King Roger of Sicily, of the year 1102; and there are others of Sicilian kings, of the 12th century. A notarial register on paper, at Geneva, dates from 1154. The oldest known imperial deed on the same material is a charter of Frederick II. to the nuns of Goess in Styria, of the year 1228, now at Vienna. In 1231, however, the same emperor forbade further use of paper for public documents, which were in future to be inscribed on vellum. In Venice the *Liber plegiorum*, the entries in which begin with the year 1223, is made of rough paper; and similarly the registers of the Council of Ten, beginning in 1325, and the register of the emperor Henry VII. (1308–1313) preserved at Turin, are also written on a like substance. In the British Museum there is an older example in a ms. (Arundel 268) which contains some astronomical treatises written on an excellent paper in an Italian hand of the first half of the 13th century. In the Public Record Office there is a letter on paper from Raymond, son of Raymond, duke of Narbonne and count of Toulouse, to Henry III. of England, written within the years 1216–1222. The letters addressed from Castile to Edward I., in 1279 and following years (Pauli in *Bericht, Berl. Akad.*, 1854), are instances of Spanish-made paper.

In Italy the first place which appears to have become a great centre of the paper-making industry was Fabriano in the marquisate of Ancona, where mills were first set up in 1276, and which rose into importance on the decline of the manufacture in Spain. The earliest known water-marks in paper from this factory are of the years 1293 and 1294. In 1340 a factory was established at Padua; another arose later at Treviso; and others followed in the territories of Florence, Bologna, Parma, Milan, Venice and other districts. From the factories of northern Italy the wants of southern Germany were supplied as late as the 15th century. But in Germany also factories were rapidly founded. The earliest are said to have been set up between Cologne and Mainz, and in Mainz itself about 1320. At Nuremberg Ulman Stromer established a mill in 1390, with the aid of Italian workmen. Other places of early manufacture were Ratisbon and Augsburg. Western Germany, as well as the Netherlands and England, is said to have obtained paper at first from France and Burgundy through the markets of Bruges, Antwerp and Cologne. France owed the establishment of her first paper-mills to Spain, whence we are told the art of paper-making was introduced, as early as the year 1189, into the district of Hérault.

In the second half of the 14th century the use of paper for all literary purposes had become well established in all western Europe; and in the course of the 15th century it gradually superseded vellum. In mss. of this latter period it is not unusual to find a mixture of vellum and paper, a vellum sheet forming the outer, or the outer and inner, leaves of a quire while the rest are of paper.

Paper in England.—With regard to the early use of paper

in England, there is evidence that at the beginning of the 14th century it was a not uncommon material, particularly for registers and accounts. Under the year 1310, the records of Merton college, Oxford, show that paper was purchased "pro registro." The college register referred to, which was probably used for entering the books that the fellows borrowed from the library, has perished. There is, however, in the British Museum a paper ms. (Add. 31, 223), written in England, of even earlier date than the one recorded in the Merton archives. This is a register of the hustings court of Lyme Regis, the entries in which begin in the year 1309. The paper, of a rough manufacture, is similar to the kind which was used in Spain.

The knowledge, however, which we have of the history of paper-making in England is extremely scanty. The first maker whose name is known is John Tate, who is said to have set up a mill in Hertford early in the 16th century; and Sir John Spilman, Queen Elizabeth's jeweller, erected a paper-mill at Dartford, and in 1589 obtained a licence for ten years to make all sorts of white writing-paper and to gather, for the purpose, all manner of linen rags, scrolls or scraps of parchment, old fishing nets, etc. (Dunkin, *Hist. of Dartford*, 305; Harl ms. 2296, f. 124 *b*). But it is incredible that no paper was made in the country before the time of the Tudors. The comparatively cheap rates at which it was sold in the 15th century in inland towns suggest that there was at that time a native industry in this commodity.

As far as the prices have been observed at which different kinds of paper were sold in England, it has been found that in 1355–1356 the price of a quire of small folio paper was 5d, both in Oxford and London. In the 15th century the average price seems to have ranged from 3d. to 4d. for the quire, and from 3s. 4d. to 4s. for the ream. At the beginning of the 16th century the price fell to 2d. or 3d. the quire, and to 3s. or 3s. 6d. the ream; but in the second half of the century, owing to the debasement of the coinage, it rose, in common with all other commodities, to nearly 4d. the quire, and to rather more than 5s. the ream. The relatively higher price of the ream in this last period, as compared with that of the quire, seems to imply a more extensive use of the material which enabled the trader to dispose of broken bulk more quickly than formerly, and so to sell by the quire at a comparatively cheap rate.

Brown paper appears in entries of 1570–1571, and was sold in bundles at 2s. to 2s. 4d. Blotting paper is apparently of even earlier date, being mentioned under the year 1465. It was a coarse, grey, unsized paper, fragments of which have been found among the leaves of 15th-century accounts, where it had been left after being used for blotting. Early in the 16th century blotting-paper must have been in ordinary use, for it is referred to in W. Horman's *Vulgaria*, 1519 (p. 80 *b*): "Blottyng papyr serveth to dryе weete wryttynge, lest there be made blottis or blurris"; and early in the next century "charta bibula" is mentioned in the *Pinacotheca* (i. 175) of Nicius Erythraeus. It is remarkable that, in spite of the comparatively early date of this invention, sand should have been used so long as an absorbent.

Paper in America.—The early printers of colonial America imported their paper from Europe, chiefly from the Continent. The first paper-mill was built in 1690 at Germantown, Pa., resulting from the combination of the needs of the Philadelphia printer, William Bradford, and the arrival of an ambitious German papermaker, William Rittenhouse. Two other mills were established in Pennsylvania in 1710 and 1729, one in Elizabethtown, N.J., in 1728, and the first in Massachusetts at Milton in the same year. Virginia's first paper-mill was built at Williamsburg in 1744 by its first newspaper publisher, William Parks. The first in New York was built at Hempstead, Long Island in 1768. With imports cut off during the Revolutionary War and increased needs for newspapers, broadsides, pamphlets, records, correspondence, etc., an acute paper famine developed. Under these conditions additional mills sprang into existence and there were probably 80 or 90 when the war ended. Paper manufacturing was protected in the first tariff. In 1810 there were more than 200 mills in operation, making about $2,000,000 worth of products.

For watermarks in paper *see* article WATERMARKS.

PAPERHANGING: *see* INTERIOR DECORATION.

PAPER MANUFACTURE. The problem of the paper maker is to make a felted web, fabric or tissue of cellulosic fibres and of appropriate uniform thickness, strength, colour and surface. For this purpose the fibres are "beaten" in water, *i.e.*, cut and bruised, so that the cellulose composing them may become more or less "hydrated," by imbibition of water, to form a wet "pulp" (*see* PAPER MATERIALS) of adequate cohesive quality: this wet pulp, as a thin even layer, is then put on to a wire fabric or screen to allow the removal of the superfluous water, and thereafter the wet web of pulp, thus formed, is finished and dried in appropriate manner to produce the paper, in the form in which it comes to the consumer. These operations may be done by hand or by machine: in olden days the beating was actually done by hand process, with a pestle and mortar, but it is nowadays invariably done by machine: the making of the felted web, on the wire, is still done by hand, but only for making the very highest class of so-called "hand made" papers, and it involves a very skilful craftsmanship which attains and maintains its highest development in the "hand made" paper industry.

These are the essentials of the paper making process: but in practice there are also additional auxiliary operations such as tinting, sizing, loading, calendering, etc. The surfacing of paper by the process of "sizing" is sometimes done by hand, in the so-called "tub sizing" process, but otherwise it is done by machine—"engine sizing." The processes of tinting, loading with mineral matter, and calendering (glazing) are also generally machine processes. Paper making, as a whole, is therefore now almost entirely a machine process: the vast output and low prices of the industry would be otherwise, of course, quite impossible.

Half Stuff.—The paper maker has a variety of cellulosic materials available for his "half stuff," *i.e.*, the mixture of say 3–5% of loose fibres suspended in water, from which to make the paper by the paper making process proper. If he starts with a cellulose material fully purified by removal of non-cellulosic substances, and felts it together, with a minimum of further treatment, he obtains a product which is, in effect, of filter paper or blotting paper type: this sort of paper has little strength, it is absorbent, it is uniform in quality from surface to surface, *i.e.*, it has no added surface quality. In order to make paper of this character the half stuff is given a minimum of treatment in the breaker or beater, *i.e.*, the knives are sharp and cut up the fibres quickly into suitable short lengths with only a little compression, bruising and comminution: then, when the wet pulp thus obtained is thrown on to the wire to be made into a sheet it parts with much water very easily, and is said to work very "free." In practice a certain amount of compression, bruising and comminution of the fibres is almost always necessary, or the resulting paper will be uneven in texture and hardly capable of holding together at all. The pulp is therefore, even in this instance, "beaten" to a suitable small extent which makes it slightly cohesive, retain more water, and work just sufficiently wet: the cellulose itself is only to some small extent "hydrated" (*see* CELLULOSE: *Hydrated cellulose*). For a very "free" paper such as filter paper or blotting paper this small amount of light beating and hydrating of the cellulose is as much as is required to give the product its distinctive character. The beating and hydration may, on the other hand, and if required, be continued un-

til finally a very slimy mass is produced in which the fibrous character of the pulp has almost completely disappeared: from it a paper of parchment-like character and considerable strength can then be made. These are the two extreme types obtainable by beating and hydration: intermediate types are also, of course, likewise obtainable proportionately. But a number of other auxiliary treatments are also necessary in order to provide the great varieties of qualities and properties required by modern conditions. Thus, special kinds of surface are required: for writing, the paper must not be too penetrable to moisture and the ink must not spread: the capillaries of the cellulose fibres, for this purpose, are therefore protected against excessive penetration, by "sizing" with more or less water-resistant substances such as rosin, gelatine, with or without auxiliaries such as casein, starch and mineral loadings and thus the felt or web is closed, covered and compacted. The paper can be also tinted, if required, and pressed between "calender" rollers, that can be heated, to give a smooth, glazed surface; or it can be "coated," by the addition to its surface of appropriate mineral matter, and an adhesive, and by treatment with "super calender" rollers.

Breaking and Beating.—The half stuff consists of water and a cellulose material, the fibres of which are separate from one another and in convenient short lengths. In preparing this half stuff it is important that no pulping or beating of the fibre should occur until it is quite clean, or the dirt present will become absorbed in the hydrated cellulose which will be formed and will thereafter remain permanently in the paper produced. The natural fibrous cells may be long, *i.e.*, several millimetres, as they are in cotton, hemp, flax, ramie, and in the operation of preparing half stuff they will have been reduced in length, by cutting under the knives of the breaker: if, on the other hand, the natural fibrous cells are short, *i.e.*, no more than two or three millimetres, as they are in wood and esparto, this cutting becomes superfluous, and breaking of them is therefore omitted. But some degree, at least, of compression bruising and comminution will be required, and hence, beating can never be omitted, except for very low grade products and such special products as cable papers. These operations of breaking and beating, therefore, produce combined effects of separating the fibres from one another, reducing their length in appropriate degree, and of bending, softening, bruising, flattening, and hydrating them, and it is possible to adjust this processing to give any desired combination of these effects and thus to modify the qualities of the resulting paper in any desired degree between the extreme limits of quality, characteristic of a paper of blotting paper type on the one hand, and of a paper of banknote and cigarette paper type on the other hand, in the latter of which the individual or ultimate fibres are beaten out of all recognition under the microscope. The manner of the adjustments required to give such variously proportioned effects is determined not only by the methods of breaking and beating employed, but also by the structural characteristics of the fibres themselves: each fibre has, in fact, its own characteristics, which the skilled paper maker bears in mind in making his adjustments. To make a strong paper it is necessary to subordinate cutting to bruising: in these circumstances the ends of the lengths of fibres, cotton, hemp, flax, ramie, are broken, splayed and tangled, and this increases their felting and strengthening qualities. Sometimes they are split longitudinally into fibrillae; and cotton fibrillae, thus formed, may display an interlacing net or trellis work appearance; the flax and hemp fibre on the other hand, frequently split into bundles of fibrillae to give a paint-brush appearance. The hydration effect, consequent on the bruising action of the beater, which leads to imbibition of water, is more easily produced in some fibres than in others: flax and hemp fibres easily hydrate, then always have a slimy feel, and are easily distinguished, in the hand, from cotton, which has not the same tendency. If the material has been beaten to work wet, which may take as much as twelve hours and more of beating, a considerable quantity of water may be retained by the material on the paper-making wire: the material then undergoes the more shrinkage in drying, and the finished paper has considerable rattle and hardness. The texture is also more closed, less porous and the amount of sizing required to give suitable ink-resistant quality is relatively small.

The breaking and beating effects are contrived by adjustment of the angles of the knives on the bed plate and on the revolving drum: the greater the angle of inclination the more rapid is the cutting effect productive of reduced lengths of fibre: the lower the angle of inclination the greater is the slower bruising action. This is the fundamental distinction between breaking and beating, though in actual practice breaking is frequently part of a combined operation that includes also washing and bleaching: a breaker is for this purpose and is therefore provided also with a drum washer, which is a wire gauze drum, revolving in the channel, and from its interior water can be continuously removed and simultaneously can be replaced by fresh water, fed in just in front of the breaker roll, so as to keep the pulp concentration at the more or less constant value required, which will be usually about 3–5%, otherwise a breaker and a beater are similar.

If half stuff, less or more beaten, is made direct into paper it gives, therefore, a product having qualities which may range from those of blotting paper to those of bank note paper. A number of other finishing operations, additional to breaking and beating, are employed to give special qualities of surface: these operations are those of colouring, sizing, loading and calendering. The substances used in these auxiliary operations are of course selected in relation to their cost and to the effects that can be derived from their use. For sizing, gelatine and rosin, with alum, are the materials much the most commonly used, though very many other substances have been or are used in much smaller degree, such as casein, starch, silicate of soda (the more acid brands are preferred), soaps (with alum), and viscose. For loading, the substances in common use are china clay (kaolin) and "pearl hardening" (calcium sulphate). Other substances have been or are used in lesser degree and for special purposes: *e.g.*, certain magnesian substances such as agalite (nearly pure magnesium silicate, akin to asbestos in composition and properties), French chalk, and soapstone assist the paper in taking a highly finished surface, which is a characteristic effect of using magnesian minerals, probably referable to their "soapy" nature: "heavy spar" (barium sulphate) is used particularly for the surface loading of photographic papers. It is usual, except in making papers of the very highest quality, to add to the pulp in the beater a small quantity of relatively cheap mineral loading material, such as china clay or "pearl hardening." This is not to be regarded as merely an adulteration, since it serves to fill up the pores of the paper and to make a closer texture, more evenly absorbent of printers' ink, and it allows a better surface to be obtained by simple calendering: most important of all, it increases opacity, and thus enables the manufacturer to provide cheap papers that can be satisfactorily inscribed on both sides. If added in large proportion, mineral loading of course greatly diminishes the strength of the paper, and particularly its powers of resisting the wear and tear of folding. The colouring of paper is effected by the addition of pigments or solutions of dyestuffs to the pulp in the beater. (*See* p. 233.) The production of definitely coloured paper is small, but the majority of papers receive some admixture of colouring matter, added with the object of correcting an otherwise objectionable tint. Thus even bleached pulps always retain a residual yellow tint, more or less pronounced, but an apparently good white can be prepared therefrom by the addition of appropriate quantities of red and blue to produce what is really a satisfactorily balanced grey. The successful production, in this way, of an approved illusion of whiteness with such low grade materials as mechanical and unbleached bisulphite wood pulp, containing up to 70% and more of the former, in modern newsprint, is a considerable industrial achievement: the fact that, in newsprint, it is short lived does not diminish the achievement.

The inchoate pulp slurry may be transformed into the cohesive dry sheet, either by hand or by machine, to make the so-called "hand made" or "machine made" paper. Paper making may therefore be divided conveniently into two portions: (*a*) the treatment of the primary raw material as far as the point at which it is in the condition of pulped cellulose half stuff, ready

for the paper making operation proper, and (*b*) the transformation of the pulped cellulose slurry thus formed into paper by the paper making process proper, with the auxiliary optional treatments of colouring, sizing, loading and calendering.

Hand Made Paper.—The expense of making paper by hand is so great that only papers for special purposes and of the highest quality are now "hand made": they are always made from "all rag" pulps of the finest quality, and they are used for such special purposes as artists' water-colour drawing papers, bank ledgers, bank notes, important documents and the highest class of printed books. The pulp from the beater is run into stuff chests from which the vats are supplied, before reaching which it is strained to ensure uniformity and removal of any adventitious ingredient. The sheet of paper is then made on a mould of wire-cloth, which has a removable frame of wood surrounding it, to keep the pulp from running off the edges while the superfluous water is running away through the meshes of the wire cloth: this removable frame is called the "deckel." The craftsman dips the mould, with the deckel in position, into the vat and lifts out enough of the pulp to make just one sheet of paper of the required thickness: as soon as the mould is removed from the vat the water begins to drain away and to leave the fibres on the surface of the wire to form a cohesive sheet: a lateral motion or "shake" given to the mould by the craftsman, assists the "felting" of the fibres and ensures their lying in all directions. The "deckel" is then removed from the mould and the mould is inverted on to and pressed against a felt, whereby the sheet is transferred or "couched" from the wire to the felt. A number of sheets, thus formed, are then piled one above another, with interleaving felts, and submitted to strong pressure to remove water: and after subsequent removal of the felts, the sheets are again pressed and dried, and matured and are then ready for sizing by dipping in a tub of gelatine solution—"tub sizing." Any "watermark" pattern or name required on the sheet is obtained by fastening the wire water-mark design to the surface of the wire mesh, which is thereby embossed to give the design of the water-mark: consequently less pulp lodges there and the paper is by so much the thinner on the lines of the water mark which thus produces in the paper the exact counterpart of the water mark wire pattern. Hand made papers are sometimes made which are extremely hard and water resistant. A high proportion of flax linen, up to 80 per cent, which hydrates very readily, gives thus a hard paper, and its water resistant quality can be further increased by "hard sizing" with gelatine containing a high proportion of alum.

Machine Made Paper.—The invention of the paper machine in 1798 by Louis Robert, a clerk in the employ of Messrs. Didot of the Essonne paper mills in France, gave a great impetus to the industry by first making the process continuous: it allowed paper to be made cheaply and in the roll. The invention was introduced into England by Henry Fourdrinier (1766–1854) after whom the machine is now always named, who owned a mill at Dartford, Kent. He secured the assistance of Bryan Donkin (1768–1855), well known as an engineer, and after much toil and perseverance, with no financial benefit, a machine was erected in 1803, at Frogmore, Hants., which worked fairly well. Dickinson, Causon, Crompton and others brought it to its present high level of perfection. Machine made paper has now completely supplanted hand made paper except for special papers of the highest class.

Paper Making Machine.—The first portion of the paper machine, where the pulp slurry is formed into a wet web, is known as the "wet end" in contradistinction to the other end, devoted to drying and finishing, which is designated the "dry end." The wire is a long endless brass wire-mesh cloth, about 40 to 50 ft. long, 70 to 90 in. commonly, and sometimes up to 240 in. wide, and with 60 to 70 wires to the inch.

The pulp slurry is pumped, at 2–3% concentration of pulp, from a stuff chest to a smaller stuff box at a higher level, is diluted to ·75%–1% with re-used or "white" water, whence it flows on to a sand trap, which is a serpentine channel to settle any heavy particles present, and then through a strainer, to stop any larger particles. From the strainer the pulp passes to the "breast box" which is the same width as the wire of the machine. Then it passes on to the endless wire, moving forwards, on which it is spread evenly by a spreader or slice, and thus a continuous wet sheet or "web," the width of the wire, is gradually formed: the pulp is prevented from flowing off the two edges of the wire, before the water has had time to run away through the wire, by an endless "deckel" strap, each side, made of vulcanized rubber, which moves at the same speed as the wire and in close contact with its corresponding surface. Thence the web passes to the dry end, *i.e.*, to a series of press rolls which remove water and consolidate the web, then to a number of steam heated cylinders to dry it into paper and to a further number of rollers to calender it. The steam heated drying cylinders are usually divided into two or more sets or stacks separated by "nip rolls" or smoothers, the object of which is to flatten and smooth the surface of the paper, while it is yet not quite dry.

The deckel straps serve to guide the paper from the moment the pulped half stuff is spread on to the wire as it issues from the "breast box" and until the web is sufficiently dry to retain its edges: the distance between the two deckel straps can be increased or diminished at will, to determine the width of paper produced. The water that drains through the wire drops into a flat copper or wooden tray along the lines of contact between the wire and a series of tube rolls, which serve to keep the wire in position: this "white" water contains fragments of pulp, and is made to flow into a tank from which it is pumped and the fragments of pulp re-used. At the far end of the wire, the wet web is passed over two or more "suction boxes" for the further removal of water, between them is the "dandy roll," a light skeleton cylinder made of wire cloth to give the water mark and wove or laid markings to the paper. The frame of the machine, from the breast roll support at one end of the wire to the first suction box at the other end, is hung on a pair of strong hinges, and is capable of a slight horizontal to and fro motion, imparted to it by a horizontal connecting rod which is keyed to an adjustable eccentric, in appropriate manner: and thus a "shake" is imparted to the forming web, as is done by hand for the hand made paper.

From the second suction box the damp web of pulp passes between "couch rolls," named by analogy with the couching in the hand made paper process: their purpose is to squeeze out more water and to impart sufficient consistency, thereby, to enable the web to leave the wires. These couch rolls are covered with felt, and the upper one is provided with levers and weights to enable the pressure on the web to be adjusted. Modern machines do not use a top couch, but use a lower couch provided with suction to remove the water. The web is now fully formed into a wet paper, and usually passes through two sets of press rolls to the dry end of the machine. The more gently and more gradually it is dried the better is the final result: rapid drying is not so economic since it is apt to make contraction uneven and excessive, and the paper brittle: the heating surface is therefore made as large as possible, and for this reason and because machines are now driven at high speeds, a large number of drying cylinders is used. All these cylinders, except the first two or three where the greatest amount of evaporation occurs, are encased by continuous, travelling felts, and they are so stacked that each surface of the paper alternates in being in contact with a heating surface. The drying cylinders are generally distributed in two or more sets or stacks with intervening nip rolls to flatten and smooth the paper while it is still moist and responsive. After the drying comes the calendering and there are usually two or more sets or stacks of calendering rolls, according to the grade of surface required. These calenders consist of vertical stacks of chilled iron rolls, generally five in a stack, which revolve on one another and some of which are bored for heating by steam: pressure is applied to them at will, by adjusting levers at the top of each stack. Finally the paper passes to cooling rolls, where the paper can be cooled by water spray if necessary and is then wound on to a reel.

The speed of the machine has to be altered frequently, while in motion, and arrangements are provided whereby the various parts of the machine can be slightly altered in speed relatively to one another, to allow for varying contractions and expansions of the

web, for different thicknesses and different pulp materials. Adjustments are also possible by changing the driving speed of the steam engine governor, and, if necessary, also by changing the driving wheel. Skilful control is obviously required and, in practice, it is found advantageous to have two separate steam engines: the first, at constant speed, drives the strainers, pumps, shake motion, etc., and the second, working the machine, varies in speed according to the rate at which the machine requires to be driven: their combined H.P. will be 40–100 or more. The drying cylinders form convenient and economical condensers for the two engines and it is customary to exhaust one driving engine into the drying cylinders and to utilize the latent heat of the steam for drying the paper, supplementing it, if necessary, by further live steam.

The mills making better class papers commonly use machines up to 90 in. wide, and they make closer and more even sheets than do wider machines: but newsprint sheets are made up to 240 in. wide running up to 1,200 ft. per minute. The former machines will make 20 to 40 tons a week, the latter up to 750 tons.

Tinting and Colouring.—The colouring of paper, including the colour correcting of unfavourable tinges of the pulp, is always effected by adding suitable substances to the pulp in the beater, *i.e.*, before the pulp goes on to the wire. Originally, pigments were practically the only substances available, and many of the pigments used then are still used to-day. Smalts (very finely powdered glass, coloured blue with cobalt) are extremely permanent and are also expensive: they are therefore used for hand made papers only. Ultramarines, of various shades from reddish blues, through pure blue to greenish and yellowish blues are made and they are also much used. They are sensitive to acids and even to solutions of alum, which is slightly acid in reaction, as well as to oxidizing substances such as bleaching agents: hence the colour is apt to be evanescent and care must therefore be taken, especially by effective washing, to ensure that the pulp is free from unfavourable substances. Red pigments in use are rouge, Indian red, Venetian red, etc.: they are natural earths, refined by levigation, and rich in iron oxide to which their redness is due: an artificial red of similar chemical character is also prepared by calcining ordinary green vitriol (iron sulphate, copperas). Chrome yellow (lead chromate) is extensively used for the production of brilliant yellows. It is decolourized by strong acids, dissolved by caustic soda, and blackened by sulphides: it is therefore apt to be discoloured by exposure in cities in the open air, on, *e.g.*, posters. Ochres, which are natural earths containing iron oxide, are used and they give various shades of dull yellow or buff: golden shades are commonly made by using mixtures of ochre and chrome yellow: solutions of iron salts are also used, for the same purpose. Green is usually provided by using chromium oxide and brown by using umbers, which are natural earths containing manganese oxide in addition to iron oxide: the latter are much used as combined colouring and loading agents for brown wrapping papers. There are also some organic pigments and lakes in use, the most important of which is Prussian blue, made by precipitating a soluble ferrocyanide solution with a solution of an iron salt and supplied to the paper maker in paste form. It is sensitive to alkali, which precipitates a brown stain of iron oxide, on paper, when it is present. A number of organic synthetic pigments are valuable by reason of their qualities of permanence: indanthrene blue is very permanent and much used for high grade writing papers: soluble dyes are also largely used.

Briefly the uses of available colouring agents for tinting purposes are as follows. Smalts are the only blueing agents used for the highest grades of papers. For other high grade papers, such as high class all rag machine made papers and high grade sulphite pulp papers, ultramarine is the usual tinting agent: it is practically as permanent as smalt, provided that it is not exposed to the action of acid fumes: indanthrene blue is, however, coming into increasing favour in competition with it. Of lower grade blues there are many water soluble blues, acid coal tar dyestuffs, which are completely precipitated by alum and they are therefore used with sized papers only, usually esparto and chemical wood papers: Prussian blue is also used. For the tinting of the cheapest grades of paper, *e.g.*, newsprint, the very powerful, cheap and light-fugitive, methyl and ethyl violets, blues, greens and reds are used.

Many of the colouring matters now so commonly used are therefore rather sensitive to chemical action: and the commonest active chemical thus to be dealt with, is of course bleaching powder, a solution of which is used in developing the high white colour required in writing and printing papers. Washing will remove the superfluous bleach remaining in the pulp, in time; but time may be saved, frequently with advantage, by using a dilute solution of an "antichlor". Sodium thiosulphate, the "hypo" of photography—has been much used for this purpose: but sodium sulphite is preferred by many paper makers because it has less action on the "wire" of the paper machine, even though about three times as much of it is required for the same effectiveness. These substances react at once with any surplus bleach residues present in the pulp, to form harmless substances. Hydrogen peroxide would be the ideal substance, for this purpose, and it has been used: but its high cost makes its use prohibitive. Whatever antichlor is used, an excess of it must be avoided because they all of them have some slight unfavourable effect on the sizing and to a small extent on some colouring substances. The beater man, in practice, has to add to the pulp the minimum quantity of antichlor that will just prevent the blueing of starch iodide test paper by the pulp: he then knows that there is no free chlorine (or hypochlorite) residue left in the pulp. It is worthy of mention that an excess of antichlor is most objectionable in any paper, such as tissue paper, used for wrapping brass or silver, and in printing papers used for bronze or so-called gold lettering: these antichlors, being compounds containing sulphur, are likely to blacken silver and copper by formation of sulphides, and it is therefore best that such papers should be made without antichlors, and that they should be absolutely condemned for these uses if any antichlor is present, even in the minutest traces. (Ultramarine also contains sulphur, and its presence is similarly objectionable.) The present tendency is to avoid the use of antichlors and to rely on very perfect washing.

Sizing.—The sizing materials used, above all others, are rosin-alum and gelatine-alum. Papers of the filter paper or blotting paper type depend for their characteristic quality on an absence of sizing, though a small quantity of starch, as binder added to the beater, is sometimes used in making them. A great many other papers, certainly all writing and printing papers, are sized. Rosin-alum sizing is always added to the beater, *i.e.*, before the pulp goes on to the wire of the paper making machine, and hence it is called "engine sizing": gelatine-alum sizing is always employed for hand made papers, and these papers are dipped in a tub (originally by hand, now more frequently by machine) containing the sizing solution and hence gelatine sizing, sometimes called "animal sizing" is also commonly known as "tub sizing." The method is also employed for sizing machine-made papers, which is sometimes achieved by intruding a sizing tub between two of the stacks of drying cylinders; more frequently by employing a separate unit. Many attempts have been made to gelatine size paper by adding the size direct to the pulp in the beater, as is done with rosin sizing. This would be the most convenient method, if it were feasible; but as yet no successful method has been evolved capable of giving favourable results proportionate to cost.

Rosin Size.—Rosin, the residue from turpentine distillation, is an acid anhydride or mixture of anhydrides, insoluble in water. It is rapidly dissolved by heating with alkaline solutions, *e.g.*, caustic soda or soda ash, to give sodium salts which are the so-called rosin soaps, so frequently used as ingredients of the yellow soaps of commerce. Ordinarily, neutral rosin soaps are thus obtained containing 100 of rosin to 17 of soda: but, by prolonged heating and stirring, a further large extra quantity of rosin may be brought into solution or suspension to give very "acid" sizes, containing as much as 35 per cent of combined rosin, 24 per cent of free rosin and 3·5 per cent of soda. They give milky emulsions, "size milk," containing suspended globules or droplets of precipitated rosin, on dilution with water. Much care is therefore required in diluting these acid sizes, for addition to the beater,

because there is always the danger present of these precipitated droplets agglomerating together, to form particles of such dimensions as would cause resin specks in the finished paper. The danger is diminished by adding starch to the diluting water. Still more recently, acid sizes containing as much as 45% of free rosin have come into use, and their use requires still more care and skill. They are used with atomiser injectors by means of which the strong size is mixed first with a small proportion of hot water and then with a larger quantity of cold water. The manufacture of these sizes is now a separate industry and the paper maker can purchase concentrated acid sizes, ready made for dilution.

The quantity of acid size usually required is that representing two to three pounds of original rosin per 100 lb. paper: but it depends greatly upon the nature of the fibre and the degree of beating. The sizing operation consists, firstly, in adding the diluted size to the beater after passage through a fine screen or coarse cloth filter bag, and it is usually added when the pulp is one-half to two-thirds beaten: secondly, a solution of alum, or, more commonly, aluminium sulphate, is added to the beater which fixes the rosin in the pulp, by double decomposition between the rosin soap and the aluminium salt, with formation, perhaps, of aluminium rosinate, but more likely of a coagulated colloid absorption complex of rosin-alumina. The optimum quantity of alum is determined by experience and is a good deal higher than the equivalent quantity calculated from the chemical equation. To economize alum it is sometimes desirable to add a proportion of dilute sulphuric acid to the beater with the object of neutralizing the basic ingredients present: *e.g.*, esparto and soda pulps are frequently alkaline in reaction. Experience has shown that the best sizing results obtained with rosin are those given by a finished paper slightly acid to litmus.

Gelatine Size.—Gelatine size is prepared from paper makers' gelatine of good intermediate grade, *i.e.*, of not too high viscosity and proportionately lesser penetrating power, and alum. The gelatine is usually purchased by the paper maker in thin sheets which swell and disperse easily in water and give a clear pale solution, after filtration; the alum solution is then added to it and the viscosity increases up to a point and thereafter diminishes on addition of more alum solution: it is then ready for use as sizing. The proportion of alum is 10 to 15% of the weight of the gelatine: the alum prevents the bacterial decomposition of the gelatine, but its principal purpose is to make the gelatine much more resistant to ink, and the paper therefore less penetrable. A certain proportion of soap is sometimes added, for hand-made papers, which renders the paper capable of taking a high finish by calendering and supercalendering. The soap should be firm and very white, and therefore free from rosin: in presence of the alum it forms insoluble aluminium soap. An acetylated starch named "feculose," made in several grades varying in penetrating power, has been employed as a substitute for gelatine, in tub sizing: it is used without alum and its chief sizing characteristic is that its effect is pronounced on the surface and with little penetration: it is, therefore, economical in use. The use of casein for sizing is limited, because of its relatively high cost: it imparts a certain degree of toughness and a good "handle" to the finished paper. Many attempts have also been made to use viscose as a sizing, which by reversion to cellulose would realize the ideal of sizing cellulose with cellulose: but its technique is difficult, and the action of the sulphur compounds on the metal of the machinery, with the parallel action on minute specks of metal in the paper itself, derivable from beating, is an adverse factor.

Loading.—Loading paper with mineral substances is an important auxiliary treatment, and it should not be considered as an adulteration, pure and simple. To writing and printing paper loading gives opacity: to process papers a highly glazed, compact surface suitable for fine-screen illustration work: to wrapping papers, ochre-brown and other colours. Colour tinting is also, of course, a loading. Other than hand made papers unloaded papers are altogether exceptional. Two to 3% of loading and up to 10% is common and 20 to 30% in specially surfaced papers, anything more than which is certainly an adulteration, greatly weakening the strength of the paper. The larger proportions of loading, particularly for surfacing with supercalenders, are added to the surface with an adhesive, commonly casein or starch, and thereafter the special surface developed by glazing. The cheaper papers are glazed on the paper machine in the calenders as described: the better class of very highly glazed papers and those that are tub sized are also frequently given an additional glazing by supercalendering them or by plate glazing them between plates of zinc or copper. The supercalender, for this purpose, is a stack of rolls alternately of heated cast iron and of compressed cotton or paper so that the paper at each nip is between iron and cotton.

Paper, though made in the roll on the machine, is usually sold in the form of sheets. A number of reels of paper, on their spindles, mounted in a sack, are fed, as a pile of webs, between two rollers: a series of revolving knives slits them longitudinally as they emerge from between the rollers, in effect into strips which are cut again transversely by the scissors action of a movable upper knife, working periodically against a lower fixed knife. The cut sheets fall on to an endless felt for stacking: they are thereafter sorted, usually, into three classes known as "perfect," "retree" (French *retirer*, to discard) and "broke." The retree are sold as second quality and the broke returned to the mill for repulping, as waste paper.

The introduction of esparto and wood pulp has greatly increased the number of grades of paper in use. Paper testing and valuation have therefore become a matter of great importance. The principles of paper testing that have gradually proved themselves of value are partly physical and partly chemical. The physical tests involve determinations of strength, elasticity, stretch or expansion on moistening, resistance to wear and tear by crumpling and folding. Ingenious machines, of various patterns, have been devised for making such tests under strictly comparable standard conditions. In hand made papers the values determined are found to be independent of direction but variable from place to place in the same sheet: in machine made papers the values determined are more independent of locality but they depend always on the direction in the sense that the paper is always weaker longitudinally than it is transversely, and this is referable to the circumstance that at the moment of the formation of the web from the wet pulp, on the wire of the machine, the wire is continuously moving forward. Sizing quality is judged by capillary effects, such as the rise of water up a strip of paper dipping in water, or the spreading of a blot of ink on its surface.

The chemical tests employed are mostly those of moisture content, *i.e.*, loss of weight by drying at 100° C; ash content, by incineration and weighing of the ash remaining: the nature and percentage of sizing, usually gelatine or rosin, the gelatine being identified by extraction of the paper with hot water and testing with tannic acid solution, which gives a gelatinous precipitate with gelatine (it can be estimated quantitatively by Kjeldahl's determination of nitrogen, if required) and rosin being extracted with alcohol, and the loss of weight, thus arising, is taken as equal to the weight of rosin present. Acidity and alkalinity are determined by ordinary indicator dye, colour reactions (litmus, congo red, methyl orange, etc.). The "fibre furnish," *i.e.*, the kinds of fibre present and their approximate percentages are determined by microscopic examination of prepared slides, suitably stained (*see* FIBRES).

Standard Sizes.—Paper is sold in sheets of different sizes and is made up into reams containing from 480 to 516 sheets in Great Britain, 500 in the United States; these sizes correspond to different trade names, as foolscap, demy, royal, etc.; the following are the ordinary British sizes:

Writing Papers	Inches	*Drawing and Book Papers*	Inches	*Printing Papers*	Inches
Pott	12½×15	Demy	15½×20	Demy	17½×22½
Foolscap	13½×16½	Medium	17¼×22½	Double demy	22½×35
Double foolscap	16½×26½	Royal	19×24	Quad demy	35×45
Foolscap and third	13¼×22	Super-royal	19¼×27	Double foolscap	17×27
Foolscap and half	13¼×24¾	Imperial	22×30	Royal	20×25
		Elephant	23×28		
		Double-elephant	26½×40

Classification.—The following list includes the chief papers.

Rag

(1) Hand made, drawing, ledger, and bank-note and book papers

(2) Machine made drawing and other papers, often mixed with high grade sulphite wood pulp

(3) Filter papers

(4) Cigarette papers, heavily beaten, frequently with about 10% chalk as loading the so-called India paper, for printing Bibles, etc., is very similar.

(5) Tissue papers similarly, without loading (suitable for wrapping silver).

(6) Imitation parchment, similarly by heavy beating. This paper is grease-proof but not water-proof.

(7) Wax surfaced wrapping papers requiring some strength in one direction, *e g*, toffee wrappers.

(8) Vegetable parchment The cellulose is hydrated by passing through a bath of 66 per cent sulphuric acid and thereafter very thoroughly washed It is water-proof as well as grease-proof

(9) Vulcanized fibre—the cellulose of the dyed all rag sheets of paper—is hydrated by passing through very concentrated zinc chloride solution, and then very thoroughly washed and several layers welded together under pressure

(10) Willesden paper made similarly with cuprammonium hydroxide solution instead of zinc chloride solution

Esparto

(11) Writing and printing papers, with chemical wood, especially sulphite pulp

(12) Magazine papers frequently contain high percentages of esparto.

(13) Blotting papers, often with soda wood pulp.

Chemical Wood (a) *Bleached*

(14) Sulphite pulp writing and printing papers.

(15) Good grade machine made drawing papers.

(16) Sulphite imitation parchment, by heavy beating (*see* [5] above).

(17) Vegetable parchment from sulphate or sulphite wood pulp (*see* [8] above).

(18) Tissue paper, by beating, from sulphite or sulphate pulp (not suitable for wrapping silver, as a rule).

(19) Ordinary wax covered wrapping papers made from sulphite

(20) Cheque papers, from sulphite, usually with chemical reagents incorporated to prevent falsification.

(*b*) *Unbleached.*

(21) Sulphite, including the incompletely cooked chips screened from fully cooked pulp, is used for so-called "Manila" envelopes, etc.: sometimes also tinted to simulate the colour.

(22) Underboiled sulphate pulp is especially valuable for strong so-called "Kraft" wrapping papers.

Mechanical Wood.

(23) 70 to 80% mechanical wood to 30 to 20% unbleached sulphite pulp, plus about 10% mineral loading, rosin-alum sized, is the material of the modern newspaper: the machines are commonly 160 in. to 240 in. wide and run off the paper at about 550 ft. to 1,200 ft. a minute

(24) Mechanical wood is used for the centres of paper-covered cardboard, *e g*, containers for cigarettes, railway passenger tickets, etc · re-pulped old newspapers are used for the same purposes.

(25) Low grade brown paper, made from paper waste, including old newspapers, heavily loaded with ochres and umbers.

Special Products.

(26) Straw boards and stiff cardboards made from straw boiled with lime (for cheapness)

(27) Cable papers made from strong manila hemp, old rope, usually lime boiled, unbeaten and unbleached.

(28) The yellow cigarette papers, much used on the Continent, frequently contain some hemp.

(29) Imitation art papers usually chemical wood with 20% loading (even more in low grades) heavily calendered to give glossy surface; sometimes supercalendered, which adds to the cost.

(30) True art papers· high content of esparto frequently with chemical wood; loading applied as a surface layer with an adhesive, frequently casein; supercalendered. (C. J. J. F.)

Production.—The output of paper has become enormous The United States produces and uses considerably over one-half the world's production. Of Canada's production in 1926 1,889,208 tons was newsprint paper most of which was exported to the United States Northern Europe is an important producer.

Great Britain imports more than half the paper used and for the paper manufactured most of the raw material is imported. Production statistics for the leading countries follow.—

Country	Year	Tons
United States	1927	10,002,070
Canada	1926	2,266,143
Germany	1927	2,008,000
Great Britain	1927	1,600,000
Japan .	1926	808,140
Russia	1927	641,098
Norway	1926	635,077
Sweden	1926	598,020
Finland	1926	566,950

PAPER MATERIALS. The supply of rags is insufficient to meet modern demands, and first esparto (about 1860) and then wood (about 1880) accordingly came into use; the use of wood has been greatly advanced, until nowadays it provides by far the largest portion of the world's paper, and it is to wood that the world looks for the somewhat alarming demands of the future The total consumption of wood per annum for paper is at present about 40,000,000 tons of, mostly, coniferous wood, from which about 15,000,000 tons of wood cellulose pulp for the paper industries are obtained. Hitherto the forests of Europe and North America have met a very large proportion of the whole demand, and mainly by a prodigal process amounting to mere extermination, which has left, especially in North America, a legacy of difficult economic problems as possibly permanent factors determining ultimate output

Demand for Pulp Wood.—Nevertheless, even in 1929, the demand for pulp wood amounts to no more than 5% of the total wood cut in North America and Europe, by comparison with 95% used for timber construction work of all sorts, fuel, etc. Extensive systematic afforestation is just beginning and its benefits may be expected to become increasingly important in a generation or two. losses by forest fires, which, *e g.*, in Canada destroy an amount of wood equal to the amount actually cut, may be expected to be brought under control and gradually diminished, and some wasteful uses of wood, *e g*, as fuel, may be partly superseded by the better use of water power and coal.

Even now, when so little has been done to conserve what is available, it is said that annual growth replaces about 80% of the amount cut. Improvements and inventions in the chemistry of pulp making may be expected, when required, to make other plant materials more or less as usable as coniferous woods now are. In some regions, and especially where tariffs are favourable, some local materials are already coming into use, increasingly, to supply local needs. Thus, in India there are now five mills, producing in all 33,000 tons of pulp per annum, mainly from grasses and cereals: other mills are projected and interest is being developed in the use of bamboo, a material first tried by Thomas Routledge (who also introduced and established the use of esparto), the use of which was further elaborated and brought to the level of industrial exploitation by W. Raitt, in recent years. In Burma the paper mulberry, most ancient of paper materials, is beginning to be exploited by plantation methods for the local Indian markets; and similarly in the West Indies, in Brazil, and elsewhere local paper industries are springing up.

It is clearly a gain to the whole world that regional industries should thus spring up to make use of low grade materials for the manufacture of cheap products which will not stand high freights. The supplying of local demands for cheap grades in this sort of way will stimulate a subsequent demand for better grades, which will be met by the supplies from the industrially more organized countries of Europe and North America, as has happened already in the textile industries. There is a very large amount of waste cereal material in the several countries of the world which is used for fodder, fuel, and so on: a good deal of this would be available for paper material if and when required, and some of it is even now thus used, to a minor extent, for straw boards and some grades of paper to which it gives a hard, brittle quality. The quantity available, both of natural grown and cultivated cereals and grasses, could doubtless be greatly increased. Esparto is already thus cultivated, though the output of it is relatively small, and most of it is derived from the littoral, natural grass lands of the Mediterranean. Actually about 2,000 species of plants, among those already studied and described, are known to be possible sources of fibrous raw materials, only a very small number of which have been actually used industrially, except of course by native craftsmen. And when it is considered how the quality and the output of such plants as cotton, wheat, and rubber, have been favourably modified by systematic thorough-breeding and cross-breeding, it appears certain that there must be important undeveloped utilities latent in many of these 2,000 species, which it will be possible to develop by systematic cultivation in due course.

The Outlook.—A consideration of the problem of raw material supplies is, therefore, on the whole reassuring. Difficult and complex as many of the issues undoubtedly are, and likely as they are to cause anxiety from time to time, all the indications appear to confirm the belief that the world is, on the whole, alert to them, and that future requirements will be met.

In the industrially more advanced countries of Europe and North America it appears likely that the raw materials at present in use will continue to be available and will have to be relied upon to meet future requirements. New materials are, however, continually being suggested and tried in these markets, but they do not displace or compete with those already in use. The fact is that the materials thus in use to-day are in use because of certain optimum combinations of ultimate fibre length, cellulose percentage, adequate market supplies of standard quality, suitability for economic manipulation in the factory, and so on, realizable by using them and not as obviously realizable by using other materials suggested from time to time. And the paper industry is one of severe competition at hard cut prices, and it is therefore not easy for a new material to establish itself in use. The conditions are undoubtedly very exacting, and to stand any chance of success at all the material must satisfy a number of simultaneous conditions, and do it fairly obviously, otherwise the manufacturer will not feel free to take the risk of adjusting his mill procedure to the adoption of it as a raw material. And thus, in spite of continuously rising prices, no new material of any real importance has appeared since esparto and wood first came into use about 1860 and 1880 respectively.

Classification of Material.—In the modern sense, paper may be regarded as a tissue of fibrous cellulosic material, the individual fibres of the original raw material from which it was made having been first separated from one another by mechanical or chemical action, and thereafter felted together to form the tissue. The fibrous cellulosic materials available to the practical paper manufacturer may be broadly catalogued as follows:—

For whites, writings and printings—rags, esparto, woodpulp.

For browns, wrappings and boards—wood, hemp, jute, straw, waste paper.

For the better grades the cellulosic materials should be pure cellulose, that is, freed from the incrustants with which cellulose is so frequently associated in the plant: for other grades it is frequently preferable to remove the incrustants only partially or not at all. Ordinarily the elongated cells known as fibres are the portions of the plant which are of value for paper, but the ordinary short plant cells are also sometimes of value.

Pure cellulose fibres, free from incrustants, are easily obtained from cotton, since the plant forms the cotton fibres without incrustants (other than slight traces of resinous substance easily removed by treatment with a dilute solution of soda ash), and without any short cells adhering to them. In flax, hemp and jute, the plant forms typically massive bundles of fibres in which the fibres adhere to one another more firmly than they do to the cellular matter surrounding them, and from which they are freed, industrially, by a variety of processes such as retting, scutching and so on. In wood, esparto and straw the fibres are most intimately associated with incrustants (lignone or pectin, with which they form the so-called "compound celluloses"), from which the pure cellulose fibres can be separated only by a drastic chemical treatment that, in effect, resolves the material, dissolves away the incrustant and leaves the cellulose proper undissolved. Cotton, flax and hemp, thus processed, give high yields of cellulose having considerable resistance to chemical treatment, and amounting to 75% and upwards of the original fibre weight. Wood, esparto, jute, straw, bamboo, etc., give a lower yield of cellulose (40 to 60%) which is less resistant to chemical action.

(1) **Rags.**—Rags, as they come to the rag boiler, vary greatly in regard to material, cleanliness, colour and strength, and they are graded and valued accordingly. They may contain new linen and cotton cuttings, fine white linens and cottons and inferior similar materials, coloured rags, gunny, rope, sailcloth, canvas, hemp, flax waste, manila, bagging and so on. Cotton, linen, sailcloth and canvas are made into high class hand made and machine made writing papers: rope, gunny, bagging and textile wastes of all sorts are made into wrappers and boards. Rags reach the mill in bales; they are first dusted to remove as much dirt as possible, and are then sorted into grades and such foreign matters as buttons, hooks, leather, rubber, etc., likely to diminish the value of the final paper are removed. The rags are then cut up into small pieces a few inches square, either by hand for the highest grades of papers or by machines for the lower grades. The cutting machines consist of pairs of revolving cylinders carrying one set of knives to cut the rags into strips and another set to cut the strips transversely into short pieces. The pieces are then dusted and shredded in a machine known as a "willow," consisting of an iron drum, bristling externally with iron spikes, revolving inside a box armed internally with similar spikes: a wire grating in the base of the box allows dirt to fall through. The rags are then boiled with solutions of chemicals to remove fatty and greasy matter and sizing materials which may be present: caustic soda ash or lime, sometimes 100% of either and sometimes mixtures of both varying in proportion with the grade made or mill practice, is used for this purpose, in quantity about 5 to 8 per cent of the weight of rags treated, dissolved in an appropriate quantity of water. For the highest grades of material this treatment is made the gentlest: water alone or lime water being sometimes used, if feasible: by gentle treatment only can the best qualities of cellulose be fully conserved. The time of boiling is about three to seven hours, at steam pressures

about 15 to 30 lb. to the square inch, and a charge of two to three tons, in a cylindrical or spherical boiler mounted on suitable trunnions to allow slow solution, is common practice.

When the boiling is judged complete the rags are discharged from the boiler, varying in colour from light brown to black, into a "breaker," which is an oval shaped vessel divided down the centre by a "midfeather" or partition which is placed along the major axis of the vessel, without extending to its ends. In the bottom, at one point of the channel thus formed, is a bed plate containing fixed steel knives against which play similar knives on the periphery of a heavy cast-iron roller, suitably mounted on bearings and rotating in the channel, like a paddle wheel. Its motion circulates the mixture of rags and water round and round the circuit of the channel, disintegrating the rags all the while: the water is continuously renewed, and the rags thus washed, the quantity of water thus consumed being very large. Eventually clean rag pulp is obtained, which is then bleached up to the white colour required, by a chloride of lime (bleaching powder) solution, which is previously freed from turbidity by settlement and decantation: the bleaching is commonly done in the breaker, or after partial bleaching in the breaker the half bleached pulp may be tipped out into a tank and the bleaching process left to continue until complete. The material is then known as half stuff, and, after thorough washing, it is ready for making up into paper. For this purpose it is passed through the beater and thence to the wet end of the paper making machine.

(2) **"Chemical" and "Mechanical" Pulp.**—The principles of this procedure are followed for the manufacture of half stuff from compound celluloses, *e.g.*, wood and esparto, after, however, such previous chemical action as is necessary to remove the incrustants. Wood cellulose, thus prepared as a pulp free from incrustants, is called "chemical wood" to distinguish it from "mechanical wood." Mechanical wood is prepared as a pulp by grinding wood wet against a grindstone, without removal of incrustants, and it is therefore a material of very inferior grade, suitable only for the manufacture of low grade products. In recent years a highly refined spruce bleached ground wood has been developed that is satisfactory for high grade box papers where opacity and a superior printing surface is desired. Chemical wood pulp and mechanical wood pulp are prepared in mills adjoining the forests of the wood growing countries, and thence exported to papermakers all over the world, in air dry condition: the papermaker uses this pulp, plus water, in much the same way, *mutatis mutandis,* as he uses the rag half stuff, the preparation of which has been described above.

Esparto grass is derived from the littoral lands of the Mediterranean, whence it is imported almost entirely into Great Britain, and mainly Scotland, in fairly constant amount, of value about £750,000 per annum. It is shipped in bales which contain roots, weeds and other impurities. It is cleaned and boiled with 15–18% caustic soda at 4–5% strength and at 40–50 lb. steam pressure: the boiler used is almost invariably stationary and of the type known as Sinclair's patent esparto boiler which commonly takes between 2½ or 3 tons of grass. The boiler is charged through an opening at the top and when the cooking has been judged completed, which may be in about three hours, the boiled material is taken from a false bottom through a door at the side: the liquor drains from the false bottom and is removed through vomit pipes. To get rid of the roots, weeds and other impurities, the pulp, after washing and bleaching, is pumped from storage chests over a settling table or "sand table," made of wood and fitted with divisions or "weirs" behind which the heavy impurities collect, fall to the bottom and are removed. The yield of cellulose is about 40–50% on the dry weight of the grass, and the cellulose is of not very permanent quality: its fibre is short and therefore incapable of giving strength to paper made from it, but it gives a certain soft bulkiness which is esteemed for some purposes, *e.g.*, magazine papers, and it is much used in all sorts of combinations with other fibres, especially bisulphite wood pulp. Straw is treated in much the same sort of way but it requires higher boiling temperatures, gives a lower yield and consumes more bleach: it is used to a small extent as an ingredient for papers, to which it gives a hard, brittle quality; but it is used much more for making straw boards, for which purpose it is boiled with lime which is cheaper than caustic soda.

There are three processes in use for the chemical removal of incrustants from wood, with formation of "chemical wood pulp," *i.e.*, wood cellulose prepared from wood by removal of incrustants by chemical action. These are the so-called soda, sulphate and bisulphite or sulphite processes. The woods employed in Europe are mainly those of the Scotch fir (*Pinus sylvestris*), the Norway spruce (*Picea excelsa*), the poplar (*Populus alba*), the aspen (*Populus tremula*) and, in America, the black spruce (*Picea mariana*), the red spruce (*Picea rubra*), the hemlock (*Tsuga canadensis*), the balsam fir (*Abies balsamea*), the poplar (*Populus grandidentata*) and the aspen (*Populus tremuloides*). The wood is cut up into logs, de-barked and then converted into chips, ½ or ¾ inch in size, by revolving cutters: afterwards the chips are bruised by passing between rollers to enable the boiling solution, later on, to penetrate them the more easily. In the soda process the wood chips are boiled in much the same way as esparto is boiled: and with about the same proportions of caustic soda. The boiler is sometimes a rotating boiler, however, and the time of boiling longer (5–8 hours) and the steam pressure higher (90–150 lb.). The soda is recovered and used again, in this as in the esparto industry, by evaporating down the liquor to dryness and igniting the residue obtained, which is then recausticized by treatment with lime and used over again.

The sulphate process is really a derivative of the soda process, sodium sulphate being used instead of the caustic soda. The action is much gentler, the yield greater, and the fibre stronger, but the pulp is not capable of giving so high a white colour as soda pulp: it is much used for strength and when colour is not of first importance. New processes are being developed to bleach this fibre to a bright white, making it available for high grade purposes. The bisulphite process is based on the use of a solution of sulphur dioxide (sulphurous acid gas), to which lime or magnesia is added in quantity insufficient for complete neutralization. The process has been developed greatly, with a number of modifications, since its first successful industrial introduction by Tilghman, Ekman and Mitscherlich. In the early days the liquor thus used contained 2·5–4·0 per cent of total sulphur dioxide of which rather less than half was neutralized by lime or magnesia: indirect heating by steam coils at 80–110 lb. steam pressure was used, and the time of cook was 16–48 hours. Ritter and Kellner raised the sulphur dioxide concentration and the cooking temperature and introduced the use of live steam for heating: this procedure has been developed still further and the modern "quick cook" at still higher concentrations is now sometimes completed in 8–16 hours, and temperatures of 150°–160° C are reached. In general terms the gentlest treatment gives the largest yield and the strongest pulp which may be, however, relatively difficult to bleach. The boilers for this process are always stationary, vertical and brick lined with litharge cement mortar. They are commonly of enormous size and capable of taking 30 tons or more of wood chips in one charge.

PAPER MONEY. In strict definition, paper money consists of the banknotes authorized by law as legal tender and usually engraved with great care on watermarked paper to prevent forgery. Such notes may be "convertible" or "inconvertible." Convertible paper money is exchangeable into gold, and really amounts to gold certificates, being therefore, as in the case of a Bank of England note, always acceptable at its face value. Inconvertible paper money is not exchangeable into gold, and its value, therefore, depends not upon its nominal figure but upon the quantity printed and put into circulation. (*See* further Money and Currency.)

In a wider sense, the expression paper money covers all printed or written documents which are promises to pay money either on demand or at a future date. Thus defined, it covers not only banknotes, but cheques (which have become the common currency of British and American trade), bills of exchange, postal and money orders, etc. (*see* QUANTITY THEORY OF MONEY; ASSIGNATS; BANKING AND CREDIT; PRICES; CHEQUE; BILL OF EXCHANGE).

PAPHLAGONIA, a district of Asia Minor, situated on the Euxine Sea between Bithynia and Pontus, separated from Galatia by a prolongation to the east of the Bithynian Olympus. Although the Paphlagonians play scarcely any part in history, they were one of the most ancient nations of Asia Minor (*Iliad,* ii. 851). They were among the races conquered by Croesus (Herod. i. 28), and they sent a contingent to the army of Xerxes in 480 B.C. Paphlagonia passed under the Macedonian kings, and after the death of Alexander the Great it was assigned to Eumenes. It continued, however, to be governed by native princes until it was absorbed by the encroaching power of Pontus. The rulers of that dynasty became masters of the greater part of Paphlagonia as early as the reign of Mithridates III. (302–266 B.C.), but it was not till that of Pharnaces I. that Sinope fell into their hands (183 B.C.). From this time the whole province was incorporated with the kingdom of Pontus until the fall of the great Mithradates (*q.v.*) in 65 B.C. Pompey united the coast districts of Paphlagonia with the province of Bithynia, but left the interior of the country under the native princes, until the dynasty became extinct and the whole country was incorporated in the Roman empire. All these rulers appear to have borne the name of Pylaemenes, as a token that they claimed descent from the chieftain of that name who figures in the *Iliad* as leader of the Paphlagonians. Under the Roman empire Paphlagonia with the greater part of Pontus, was united into one province with Bithynia.

Paphlagonia is a rugged mountainous country, but it contains fertile valleys, and produces great abundance of fruit. The mountains are clothed with dense forests, which are conspicuous for the quantity of boxwood which they furnish. The coasts were from an early period occupied by Greek colonies among which the flourishing city of Sinope, founded from Miletus about 630 B.C., stood pre-eminent. The most considerable towns of the interior were Gangra, in ancient times the capital of the Paphlagonian kings, afterwards called Germanicopolis, situated near the frontier of Galatia, and Pompeiopolis, in the valley of the Amnias (a tributary of the Halys), near which were extensive mines of the mineral called by Strabo *sandarake* (red sulphuret of arsenic), which was largely exported from Sinope.

See W. M. Ramsay, *Hist. Geog. of Asia Minor* (1890); *Cambridge Ancient History,* vol. iii. (with useful bibliography).

PAPHOS, an ancient city and sanctuary on the west coast of Cyprus. The sanctuary and older town (Palaepaphos) lie at Kouklia, about 20 m. west of Limasol, about a mile inland on the left bank of the Diorizo river (anc. Bocarus). New Paphos (Papho or Baffo), which had already superseded Old Paphos in Roman times, lies 10 m. farther west, and 1 m. south of modern Ktima, at the other end of a fertile coast-plain. Paphos was believed to have been founded either by the Arcadian Agapenor, returning from the Trojan War (*c.* 1180 B.C.), or by his reputed contemporary Cinyras, whose clan retained royal privileges down to the Ptolemaic conquest of Cyprus in 295 B.C., and held the Paphian priesthood till the Roman occupation in 58 B.C. The town certainly dates back to the close of the Bronze age (*c.* 1200 B.C.) and had a king Eteandros among the allies of Assur-bani-pal of Assyria in 668 B.C. In Hellenic times the kingdom of Paphos was only second to Salamis in extent and influence.

Paphos owes its ancient fame to the cult of the "Paphian goddess (ἡ Παφία ἄνασσα, or ἡ Παφία, in inscriptions, or simply ἡ θεά), a nature-worship like that of Phoenician Astarte. The Greeks identified both this and a similar cult at Ascalon with their own worship of Aphrodite (*q.v.*) and localized at Paphos the legend of her birth from the sea foam, accumulated here in masses on certain winds which also cause remarkable jets of spray. Her grave also was shown in this city. She was worshipped, under the form of a conical stone, in an open-air sanctuary not unlike those of Mycenaean Greece, the general form of which is known from late gems, and Roman coins; its ground plan was discovered by excavations in 1888. It suffered repeatedly from earthquakes, and was rebuilt more than once; in Roman times it consisted of an open court, with porticos and chambers on three sides, and a gateway through them on the east.

After the foundation of New Paphos and the extinction of the Cinyrad and Ptolemaic dynasties, the importance of the Old Town declined rapidly. Though restored by Augustus and renamed Sebasté, after the great earthquake of 15 B.C., and visited in state by Titus before his Jewish War in A.D. 70, it was ruinous and desolate by Jerome's time; but the prestige of its priest-kings partly lingers in the exceptional privileges of the patriarch of the Cypriote Church (*see* CYPRUS, CHURCH OF).

New Paphos became the administrative capital of the whole island in Ptolemaic and Roman days, as well as the head of one of the four Roman districts; it was also a flourishing commercial city famous for olive oil, and for "diamonds" of medicinal power. In A.D. 960 it was attacked and destroyed by the Saracens. The site shows a Roman theatre, amphitheatre, temple and other ruins and rock tombs, part of the city wall, the moles of the Roman harbour, and a ruined Greek cathedral. (*See* also CYPRUS.)

PAPIAS, of Hierapolis in Phrygia, one of the "Apostolic Fathers" (*q.v.*). His *Exposition of the Lord's Oracles,* the prime early authority as to the Gospels of Matthew and Mark (*see* GOSPELS), is known only through fragments in later writers, chiefly Eusebius of Caesarea (*H.E.* iii. 39). The latter had a bias against Papias on account of the influence which his work had in perpetuating, through Irenaeus and others, belief in a millennial reign of Christ upon earth.

About his date, which is important in connection with his witness, there is some doubt. Setting aside the exploded tradition that he was martyred along with Polycarp (*c.* A.D. 155), we have the witness of Irenaeus that he was "a companion (ἑταῖρος) of Polycarp," who was born not later than A.D. 69. We may waive his other statement that Papias was "a hearer of John," owing to the possibility of a false inference in this case. But the fact that Irenaeus thought of him as Polycarp's contemporary and "a man of the old time" (ἀρχαῖος ἀνήρ) together with the affinity between the religious tendencies described in Papias's Preface (as quoted by Eusebius) and those reflected in the Epistles of Polycarp and Ignatius, all point to his having flourished in the first quarter of the 2nd century. Indeed, Eusebius, who deals with him along with Clement and Ignatius (rather than Polycarp) under the reign of Trajan, and before referring at all to Hadrian's reign (A.D. 117–138), suggests that he wrote about A.D. 115. It has been usual, however, to assign to his work a date *c.* 130–140, or even later. No fact is known inconsistent with *c.* 60–135 as the period of Papias's life. Eusebius (iii. 36) calls him "bishop" of Hierapolis, but whether with good ground is uncertain.

Papias uses the term "the Elders," or Fathers of the Christian community, to describe the original witnesses to Christ's teaching, *i.e.,* his personal disciples in particular. It was their traditions as to the purport of that teaching which he was concerned to preserve. But to Irenaeus the term came to mean the primitive custodians of tradition derived from these, such as Papias and his contemporaries, whose traditions Papias committed to writing. Not a few such traditions Irenaeus has embodied in his work *Against Heresies,* so preserving in some cases the substance of Papias's *Exposition.* (*See* Lightfoot, *Apostolic Fathers,* 1891, for these, as for all texts bearing on Papias.)

See articles in the *Dict. of Christian Biog., Dict. of Christ and the Gospels,* and Herzog-Hauck's *Realencyklopädie,* xiv., in all of which further references will be found; also Lightfoot, *Essays on Supernatural Religion* (1889).

PAPIER MÂCHÉ, a term embracing numerous manufactures in which paper pulp is employed, pressed and moulded into various shapes. The art has long been practised in the East. About the middle of the 18th century papier mâché work came into prominence in Europe in the form of trays, boxes and other small domestic articles. In 1772 Henry Clay of Birmingham patented a method of preparing this material for coach-building, for door and other panels and for furniture. In 1845 the application of the material to internal architectural decoration was patented by C. F. Bielefeld of London, and for this purpose it has come into extensive use. Under the name of carton pierre a substance which is essentially papier mâché is also largely employed as a substitute for plaster in the moulded ornaments of roofs and walls. Under the name of ceramic papier mâché, architectural enrichments are also made of a composition derived from paper pulp, resin, glue, a drying oil and acetate of lead. Masks, dolls' heads and other toys, lay figures, milliners' and clothiers' blocks, mirror and picture-frames, etc., are also made from it.

The materials for the commoner classes of work are old waste and scrap paper, repulped and mixed with a strong size of glue and paste. To this very often are added large quantities of ground chalk, clay and fine sand, so that the preparation is little more than a plaster held together by the fibrous pulp. For the finest work Clay's original method is retained. It consists of soaking several sheets of a specially made paper in a strong size of paste and glue, pasting these together, and pressing them in the mould of the article to be made. The moulded mass is dried in a stove and hardened by dipping in oil. For very delicate relief ornaments, a pulp of scrap paper is prepared, which after drying is ground to powder mixed with paste and a proportion of potash.

See L. E. Andés, *Die Fabrikation der Papiermaché- und Papierstoff-Waaren* (Vienna, 1900); A. Winzer, *Die Bereitung und Benützung der Papiermaché und ahnlicher Kompositionen* (4th ed. Weimar, 1907).

PAPIN, DENIS (1647–*c.* 1712), French physicist, one of the inventors of the steam-engine, was born at Blois on Aug. 22, 1647. Papin acted as assistant to Huygens (*q.v.*) in his experiments with the air pump. Later he came to London and assisted Boyle. He introduced a number of improvements in the air pump and invented the condensing-pump. In 1679 he invented his famous "steam digester," a vessel with a tightly fitting lid which prevented the steam (from water heated in it) escaping, and thus a high pressure was generated and the boiling point of the water considerably raised. A safety valve guarded against excessive rise of pressure. In 1684 Papin received from the Royal Society an appointment as "temporary curator of experiments," with a small salary. In this capacity he carried on numerous and varied investigations in hydraulics (*Phil. Trans.*, 1685, etc.). In Nov. 1687 he was appointed to the chair of mathematics in the University of Marburg, and here he remained until 1696, when he removed to Cassel. In 1705 Leibnitz sent him a sketch of Savery's engine for raising water, and this stimulated him to further exertions, which resulted two years afterwards in the publication of the *Ars nova ad aquam ignis adminiculo efficacissime elevandam* (Cassel, 1707). (*See* STEAM ENGINE.) In 1707 Papin returned to London where he died in obscurity, probably early in 1712.

Many of Papin's writings were collected by himself into a *Fasciculus dissertationum* (Marburg, 1695), of which he published also a translation into French, *Recueil de diverses pièces touchant quelques nouvelles machines* (Cassel, 1695). His correspondence with Leibnitz and Huygens, along with a biography, was published by Dr. Ernst Gerland, *Leibnizens und Huygens Briefwechsel mit Papin, nebst der Biographie Papins* (1881). *See* also L. de la Saussaye and E. Péan, *La Vie et les ouvrages de Denis Papin* (1869); and Baron Ernout, *Denis Papin, sa vie et ses ouvrages* (4th ed., 1888).

PAPINEAU, LOUIS JOSEPH (1786–1871), Canadian rebel and politician, son of Joseph Papineau, royal notary and member of the house of Assembly of Lower Canada, was born at Montreal on Oct. 7, 1786. He was educated at the seminary of Quebec, where he developed the gift of declamatory and persuasive oratory. He was called to the bar of Lower Canada on May 19, 1810. On June 18, 1808 he was elected a member of the House of Assembly of the province of Lower Canada, for the county of Kent. In 1815 he became speaker of the house, being already recognized as the leader of the French Canadian party. At this time there were many grievances in the country demanding redress. In Dec. 1820 Lord Dalhousie, governor of Lower Canada, appointed Papineau a member of the executive council; but Papineau, finding himself without real influence on the council, resigned in Jan. 1823. In that year he went to England to protest on behalf of the French Canadians against the projected union of Upper and Lower Canada, a mission in which he was successful. Nevertheless, his opposition to the government became more and more pronounced, till in 1827 Lord Dalhousie refused to confirm his appointment to the speakership, and resigned his governorship when the house persisted in its choice. The aim of the French Canadian opposition at this time was to obtain financial and also constitutional reforms. Matters came to a head when the legislative assembly of Lower Canada refused supplies and Papineau arranged for concerted action with William Lyon Mackenzie, the leader of the reform party in Upper Canada. In 1835 Lord Gosford, the new governor of Lower Canada, was instructed by the cabinet in London to inquire into the alleged grievances of the French Canadians. But the attitude of the opposition remained no less hostile than before, and in March 1837 the governor was authorized to reject the demand for constitutional reform and to apply public funds in his control to the purposes of government. In June a warning proclamation by the governor was answered by a series of violent speeches by Papineau, who in August was deprived of his commission in the militia.

Papineau had formerly professed a deep reverence for British institutions, but as party strife became more bitter and real issues were lost sight of Papineau, falling in with the views of one O'Callaghan, who distrusted everything British, became an annexationist. On Oct. 23, 1837 a meeting of delegates from the six counties of Lower Canada was held at St. Charles, at which resistance to the Government by force of arms was decided upon, and in which Papineau took part. In November preparations were made for a general stampede at Montreal, and on the 7th Papineau's house was sacked and a fight took place between the "constitutionals" and the "sons of liberty." Towards the middle of November Colonel Gore was instructed to arrest Papineau and his principal adherents on a charge of high treason. A few hundred armed men had assembled at Saint Denis to resist the troops, and on Nov. 22 hostilities occurred, which resulted in many casualties. On the eve of the fray Papineau sought safety in the United States. On Dec. 1, 1837 a proclamation was issued, declaring Papineau a rebel, and placing a price upon his head.

From 1839 till 1847 Papineau lived in Paris. In 1847 a general amnesty was granted; and, although in June 1838 Lord Durham had issued a proclamation threatening Papineau with death if he returned to Canada, he was now admitted to the benefit of the amnesty. On his return to Canada, when the two provinces were now united, he became a member of the lower house and continued to take part in public life, demanding "the independence of Canada, for the Canadians need never expect justice from England, and to submit to her would be an eternal disgrace." He unsuccessfully agitated for the re-division of Upper and Lower Canada, and in 1854 retired into private life. He died at Montebello, in the province of Quebec, on Sept. 24, 1871.

See L. O. David, *Les Deux Papineau;* Fennings Taylor, *Louis Joseph Papineau* (Montreal, 1865); Alfred De Celles, *Papineau-Cartier* (Toronto, 1906); H. J. Morgan, *Sketches of Celebrated Canadians* (Quebec, 1862); Rose's *Cyclopaedia of Canadian Biography Annual Register* (1836–37); Sir Spencer Walpole, *History of England* (5 vols., London, 1878–86), vol. iii.

PAPINI, GIOVANNI (1881–), Italian author, was born in Florence on Jan. 9, 1881. He founded the reviews, *Leonardo* (1902) and *Lacerba* (1913), and was also joint editor of *La Voce* in 1912. Professedly an iconoclast, in a volume entitled *Stroncature* (1917) he demolished many established reputations. Among his many works are several volumes of essays and criticism—*La paga del Sabato, L'uomo Carducci* (1918), *Il crepuscolo dei filosofi* (1906), and two novels *Un uomo finito* (1922) and *Parole e Sangue* (1921). His poems include *Cento pagine di poesia* (1920), *Opera prima, Giorni di festa* (1920). In his *Storia di Cristo* (1921), a book which achieved immense success, he sud-

denly abandoned his caustic and sceptical attitude in favour of mysticism.

See E. Fabri, *Papini come scrittore* (1921) and R. Fondi, *Un Construttore: Papini* (1922).

PAPINIAN (AEMILIUS PAPINIANUS), Roman jurist, was *magister libellorum* and afterwards praetorian prefect under Septimius Severus. He was an intimate friend of the emperor, whom he accompanied to Britain, and before his death Severus commended his two sons to his charge. Papinian tried to keep peace between them, but only excited the hatred of Caracalla, to which he fell a victim in the general slaughter of Geta's friends which followed the fratricide of A.D. 212. (*See* ROMAN LAW.)

PAPPENHEIM, GOTTFRIED HEINRICH, COUNT OF (1594–1632), imperial field marshal in the Thirty Years' War, was born on May 29, 1594, at the little town of Pappenheim on the Altmühl, now in Bavaria, the seat of a free lordship of the empire, of an ancient family established there. He was educated at Altdorf and at Tübingen. At the outbreak of the war he abandoned the legal and diplomatic career on which he had embarked, and took service in Poland under the Catholic League. He displayed brilliant courage at the battle of the White Hill near Prague (Nov. 8, 1620), where he was left for dead on the field. In the following year he fought against Mansfeld in western Germany, and in 1623 became colonel of a regiment of cuirassiers, afterwards the famous "Pappenheimers." In the same year, as an ardent friend of Spain, the ally of his sovereign and the champion of his faith, he raised troops for the Italian war and served with the Spaniards in Lombardy and the Grisons. His long and heroic defence of the post of Riva on the Lake of Garda made his name. In 1626 Maximilian of Bavaria, the head of the League, recalled him to Germany to suppress an insurrection in Upper Austria. In a few weeks Pappenheim crushed the rebellion with ruthless severity (actions of Efferdingen, Gmünden, Vöcklabruck and Wolfsegg, Nov. 15–30, 1626). After this he served with Tilly against King Christian IV. of Denmark, and besieged and took Wolfenbüttel. His hope of obtaining the sovereignty and possessions of the evicted prince was, after a long intrigue, definitely disappointed. In 1628 he was made a count of the empire. The siege and storm of Magdeburg followed, and Pappenheim, like Tilly, has been accused of the most savage cruelty in this transaction. After the battle of Breitenfeld, he covered the retreat of the imperialists from the lost field with care and skill, and won glory by his operations on the lower Rhine and the Weser in rear of the victorious Swedish army. Being now a field marshal in the imperial service, he was recalled to join Wallenstein, and assisted the generalissimo in Saxony against the Swedes; but was again despatched towards Cologne and the lower Rhine. In his absence a great battle became imminent, and Pappenheim was hurriedly recalled. He appeared with his horsemen in the midst of the battle of Lützen (Nov. 6th–16th, 1632). His furious attack was for the moment successful. But at about the same time as Gustavus was killed, Pappenheim also was mortally wounded. He died next day in the Pleissenburg at Leipzig.

See *Kriegsschriften von baierischen Offizieren* I. II. V. (Munich, 1820); Hess, *Gottfried Heinrich Graf zu Pappenheim* (Leipzig, 1855); Ersch and Grüber, *Allgem. Encyklopädie*, III. 11 (Leipzig, 1838); Wittich, in *Allgem. deutsche Biographie*, Band 25 (Leipzig, 1887), and works there quoted.

PAPPUS OF ALEXANDRIA, Greek geometer, flourished about the end of the 3rd century A.D. In a period of general stagnation in mathematical studies, he stands out as a remarkable exception. How far he was above his contemporaries, how little appreciated or understood by them, is shown by the absence of references to him by other Greek writers, and by the fact that his work had no effect in arresting the decay of mathematical science. In this respect the fate of Pappus strikingly resembles that of Diophantus. In his *Collection*, Pappus gives no indication of the date of the authors cited or of the time at which he himself wrote. Since he frequently quotes Ptolemy the astronomer (*fl.*, say, A.D. 140), he can hardly have been earlier than the end of the 2nd century. A marginal note to a 10th century ms. states, in connection with the reign of Diocletian (A.D. 284–305) that Pappus wrote during that period; and in the absence of better testimony it seems best to accept this indication. Suidas, it is true, makes him contemporary with Theon of Alexandria (4th century), who wrote a commentary on Ptolemy's *Syntaxis;* but, as Pappus also wrote a commentary (doubtless largely assimilated by Theon), Suidas perhaps failed to disconnect the two, and so assigned the same date to both.

The great work of Pappus, in eight books and entitled *συναγωγή* or *Collection,* we possess only in an incomplete form, the first book being lost, and the rest having suffered considerably. Suidas enumerates other works of Pappus as follows: *Χωρογραφία οἰκουμενική, εἰς τὰ τέσσαρα βιβλία τῆς Πτολεμαίου μεγάλης συντάξεως ὑπόμνημα, ποτάμους τοὺς ἐν Λιβύῃ, ὀνειροκριτικά.* He also wrote commentaries on the *Analemma* of Diodorus, on Ptolemy's *Planispherium* and *Harmonica,* and on Euclid's *Elements.* Citations from the commentary on the *Elements* are made by Proclus and others, while fragments of the portion relating to book x. survive in the Arabic.

The characteristics of Pappus's *Collection* are that it contains an account, systematically arranged, of the most important results obtained by his predecessors; and, secondly, notes explanatory of, or extending, previous discoveries. These discoveries form, in fact, a text upon which Pappus enlarges discursively. Very valuable are the systematic introductions to the various books, which set forth clearly in outline the contents and the general scope of the subjects to be treated. From these introductions we are able to judge of the style of Pappus's writing, which is excellent and even elegant the moment he is free from the shackles of mathematical terminology.

We can only conjecture that the lost book i., as well as book ii., was concerned with arithmetic, book iii. being clearly introduced as beginning a new subject.

The whole of book ii. (the former part of which is lost, the existing fragment beginning in the middle of the 14th proposition) related to a system of continued multiplication coupled with the expression of large numbers in terms of "tetrads" (powers of 10,000), due to Apollonius of Perga.

Book iii. contains geometrical problems, plane and solid. It may be divided into five sections: (1) On the famous problem of finding two mean proportionals between two given lines, to which Hippocrates of Chios had reduced the problem of duplicating the cube. Pappus gives several solutions of this problem, including his own, and also a method of approximating continually to a solution, the significance of which he apparently failed to appreciate. (2) On the arithmetic, geometric and harmonic means between two straight lines, and the problem of representing all three in one and the same geometrical figure. This serves as an introduction to a general theory of means, of which Pappus distinguishes ten kinds with examples. (3) On a curious problem suggested by Eucl. i. 21. (4) On the inscribing of each of the five regular polyhedra in a sphere.

Of book iv. the title and preface have been lost, so that the programme has to be gathered from the book itself. At the beginning is the well-known generalization of Eucl. i. 47, then follow various theorems on the circle, leading up to the problem of the construction of a circle which shall circumscribe three given circles touching each other two and two. This and several other propositions on contact, *e.g.,* cases of circles touching one another and inscribed in the figure made of three semi-circles and known as *ἄρβηλος* (*shoemaker's knife*), form the first division of the book. Pappus turns then to a consideration of certain properties of Archimedes's spiral, the conchoid of Nicomedes, and the curve discovered by Hippias of Elis about 420 B.C., and known by the name *ἡ τετραγωνίζουσα*, or *quadratrix.* Proposition 30 describes the construction of a curve of double curvature called by Pappus the helix on a sphere, a construction analogous to that of Archimedes's spiral in a plane. The area of the surface included between this curve and its base is found by the classical method of "exhaustion" equivalent to integration. The rest of the book treats of the trisection of any angle, and the solution of more general problems of the same kind by means of the quadratrix and spiral. In one solution of the former problem is the first recorded use of the property of a conic (a hyperbola) with reference to the focus

and directrix.

In book v., after an interesting preface concerning regular polygons, and containing remarks upon the hexagonal form of the cells of honeycombs, Pappus addresses himself to the comparison of the areas of different plane figures which all have the same perimeter (following Zenodorus's treatise on this subject), and of the volumes of different solid figures which all have the same superficial area; and, lastly, a comparison of the five regular solids. Incidentally Pappus describes the 13 other polyhedra bounded by equilateral and equiangular but not similar polygons, discovered by Archimedes, and finds, by a method recalling that of Archimedes, the surface and volume of a sphere.

According to the preface, book vi is intended to resolve difficulties occurring in the so-called *μικρὸς ἀστρονούμενος*. It accordingly comments on the *Sphaerica* of Theodosius, the *Moving Sphere* of Autolycus, Theodosius's book *On Days and Nights*, the treatise of Aristarchus, *On the Sizes and Distances of the Sun and Moon,* and Euclid's *Optics* and *Phaenomena.*

The preface of book vii. explains the terms analysis and synthesis, and the distinction between theorem and problem. Pappus then enumerates works of Euclid, Apollonius, Aristaeus and Eratosthenes, 33 books in all, the scope of which he intends to describe, with the lemmas necessary for their elucidation With the mention of the *Porisms* of Euclid we have an account of the relation of porism to theorem and problem In the same preface are included (*a*) the famous problem known as "Pappus's Problem," which formed, so to say, the "text" of Descartes's *Géométrie;* (*b*) the theorems which were rediscovered by and named after Paul Guldin, but appear to have been discovered by Pappus himself. Book vii. contains also (1), under the head of the *de determinata sectione* of Apollonius, lemmas which, closely examined, are seen to be cases of the involution of six points; (2) important lemmas on the *Porisms* of Euclid (*see* PORISM); (3) a lemma upon the *Surface-Loci* of Euclid which gives a complete proof of the focus-directrix property of the three conic sections.

Lastly, book viii. treats principally of mechanics, the properties of the centre of gravity, and some mechanical powers. Interspersed are some questions of pure geometry Proposition 14 shows how to draw an ellipse through five given points.

BIBLIOGRAPHY.—Of the whole work of Pappus the best edition is that of Hultsch, bearing the title *Pappi Alexandrini collectionis quae supersunt e libris manuscriptis edidit latina interpretatione et commentariis instruxit Fridericus Hultsch* (Berlin, 1876–78). Previously the entire collection had been published only in the Latin translation (with commentary) by Commandinus (Pesaro, 1588, etc). For a detailed account of Pappus's work *see* G. Loria, *Le scienze esatte nell' antica Grecia,* 1914, esp pp. 656–703; T. L. Heath, *History of Greek Mathematics* vol. ii. pp 355–439. (T L H)

PAPUA, a name for the whole island of New Guinea, also used for British New Guinea, and known as Territory of Papua. (*See* NEW GUINEA.)

PAPUAN LANGUAGES. Papuan languages are spoken in New Guinea and the adjacent islands, and in the Solomon group. The Halmaheran languages of Indonesia are included with them. The definition of the languages is essentially negative, and they are described as those languages of the Melanesian and Indonesian regions which differ entirely in grammar, and very largely in vocabulary, from the Austronesian. The Papuan languages are not members of a single linguistic stock, but differ from one another in word-formation, in grammatical categories and expressions, and in syntax. The variations in vocabulary are extreme, and villages only a short distance apart use languages without a single common feature.

Geographical Distribution.—In the British portion of New Guinea there is an unbroken succession of Papuan forms of speech from the Netherlands boundary to the St. Joseph and Vanapa rivers on the south coast, and to Collingwood bay on the north coast. East of these places Papuan languages are spoken on the hills inland and in the upper river valleys, and reach the coast only between Keakalo and Orangerie bays. East of Collingwood and Orangerie bays and in the islands off the south-eastern end of New Guinea, no Papuan languages appear, except doubtfully in Rossel island in the Louisiade archipelago. In British territory more than sixty Papuan languages have been partially recorded, but only fifteen are known by grammars. These are:—

1. Kunini on the coast west of the Fly delta
2. Miriam in the eastern islands of Torres straits.
3. Kiwai on the islands of the Fly delta, with many variations in vocabulary.
4. Tirio on the western shore of the Fly delta
5. Goaribari or Kerewa at the mouth of the Bamu river
6. Namau in the villages of the Purari delta.
7. Orokolo on the Papuan gulf.
8. Toaripi or Motumotu, at the eastern end of the Papuan gulf.
9. Binandele, in the basins of the Mamba, Gira and Ope rivers in the north-west of the possession
10. Ambo or Afoa (Tauata) inland from Hall sound and around Mount Yule.
11. Fuyuge or Mafulu in the mountains inland from Galley reach
12. Koiari, inland from Port Moresby, and Koita in the Motu villages.
13. Mulaha (now extinct), on the south-east coast
14. Kwale, inland from Kapakapa
15. Magi or Mailu, in coast villages from Cheshunt bay to Toulon island.

In the mandated territory the languages are Papuan, except in a few small districts on the coast, opposite islands where Melanesian dialects are spoken A large number of short word-lists are recorded, and six languages are represented by grammars.

1. Kate, inland from Finschhafen
2. Bongu, inland from Astrolabe bay
3. Bogajim, inland from Astrolabe bay
4. Monumbo, on the coast at Potsdamhafen, opposite Vulcan island.
5. Kavu, opposite Muschu island.
6. Valman, east of Berlinhafen.

In Netherlands territory there are many languages which are definitely non-Indonesian and non-Melanesian and are therefore included with the Papuan. But very little is known of the grammar and the uncertain classification depends almost entirely on vocabulary. One language of this region, the Nufōr or Mefor, is represented by a grammar, but is essentially a mixed language. The best known of the Papuan languages are

On the north coast:

1. Seka and Sentani, Lake Sentani
2. Pauwi, on the lower Mamberamo river
3. Angadi, Goredu and Nagramadu in the neighbourhood of Lake Jamur.

On the south coast:

4. Mimika, inland from Mimika river.
5. Merauke or Marind-anim, on the coast, between the Kumbe river and the British boundary.

West of New Guinea in Halmahera, the northern part of the island of Gilolo, the languages differ from the Indonesian They are well known by comparative grammars and word-lists, and are conveniently grouped with the Papuan

In New Britain several Papuan languages are recorded Those known by grammars are:

1. Baining, in the mountains inland of Gazelle peninsula.
2. Sulka, on the coast near Cape Orford.

In New Ireland several Papuan languages are named but exact information is wanting

In the Solomon islands at least seven Papuan languages are known.

1. Nasioi, on north coast of south-east Bougainville island.
2. Koromira, adjacent to Nasioi
3. Telei or Buin, in south of Bougainville island.
4. Bilua in Vella Lavella island.
5. Baniata in Randuvu (Rendova) island
6. Laumbe, in Russell (or Cape Marsh) island.
7. Savo, in Savo island west of Florida.

Classification.—A complete survey of the Papuan languages is not yet possible and classification based on grammar is premature. At present no two Papuan languages show sufficient likeness in grammar to establish genealogical relationship and each name in the foregoing list represents an independent linguistic stock.

Grammar.—Some of the Papuan languages are less complex than others, but all are difficult to acquire Where Papuans and

Melanesians are in contact the Melanesian language is used by both. Many Papuan languages were unknown until about thirty-five years ago, and our present knowledge of them is mainly due to missionary studies in translating the Scriptures.

The pronouns of the various languages have no common basis. They often indicate the dual, and rarely a trial number by suffixes which may or may not be derived from the numerals "two" and "three." Sometimes entirely distinct words are used. Very few Papuan languages have two forms of the first dual and plural personal pronouns; one indicating the inclusion, the other the exclusion of the person addressed, so that "we" means either "you and I" or "he and I" (in the plural "they and I"). In some languages the possessive pronoun does not differ from the personal, but in others a suffix is used. There are many irregularities and omissions, and some languages use more than one method. A different pronoun or different method is sometimes used to indicate a special kind of possession, and these pronouns may sometimes be used without the noun.

In most of the Papuan languages there is no indication of grammatical gender and the pronouns of the third person rarely distinguish sex. In a few languages there is a classification of nouns with a special pronoun for each class, and the classification is not sexual.

In Nasioi the classification is as varied as the Bantu of Africa. The classes are distinguished by a suffixed article, and the numerals, possessive, interrogative and demonstrative pronouns and adjectives take endings in concord with the noun.

The genitive usually precedes, sometimes with a particle, sometimes with a pronoun, between the governed and governing words.

In a few Papuan languages the subject and object of the verb are shown only by separate nouns or pronouns, the verb itself undergoing no change. In most of the languages the objective pronoun is combined with the verb as prefix, infix or suffix. Some languages indicate the subject by a change in the verbal ending. This often varies according to tense. Other languages indicate both subject and object by distinct particles or by syllables meaning I-thee, I-him, you-me, etc., in which separate pronouns do not appear. Some of the Papuan verbs only indicate two persons, an inclusive person, used with the pronouns I and we, and an exclusive person used for all others, but in some languages the inclusive person is used with I, we and you, and the exclusive for he and they.

Most Papuan languages have only the numerals "one" and "two," and three is rarely found. In some places Melanesian expressions are imitated. It is a Papuan custom to recall the number of objects by using parts of the body as tallies.

PAPUANS (Malay *papúwah* or *puwah-puwah*, "frizzled," "woolly-haired," in reference to their characteristic hair-dressing), the name given to the people of New Guinea and the other islands of Melanesia. The pure Papuan is found in most parts of New Guinea and is an element in Melanesia. Papuan elements formerly existed in Australia, and the Tasmanian race may be akin to the Papuan. The typical Papuan is woolly haired, long headed, dark skinned, broad nosed. The nose is often prominent and convex.

Their culture is very diverse, and in parts has been affected by contact with other peoples. Modern research (Armstrong and Laudtman) has added much to our knowledge of the Papuans, and further investigations are being undertaken from Australia, which controls the area by mandate.

Social Order.—Custom regulates the duties in life, but where cases of doubt or difficulty arise, the old men—with more of social importance and individuality—discuss and decide the issue. Here and there are chiefs, or head men, and patrilineal succession is found in certain districts. The exogamic clans are local groups, totemic, and generally patrilineal, though kinship systems are "classifactory." Marriages are often regulated more by kinship, reckoned by genealogical methods, than by clanship. Exchange marriages are frequent. In Rossel Island—a mixed culture—a class system in decay was found by Armstrong. Once naked and unashamed, the people often suffer now from extreme prudishness. Polygamy was once prevalent. The initiation rites included lessons in morals. Pre-nuptial chastity was rare. Individual ownership of land was recognized. Children generally divided their father's property equally, but bequests (verbal) were respected.

BY COURTESY OF THE ROYAL PACKET NAVIGATION CO.

A PAPUAN NATIVE OF DUTCH NEW GUINEA

Magical practices were common, but the training of a magician was unpleasant and rigorous, the methods employed being of the ordinary type. (*See* MAGIC: PRIMITIVE.) Ceremonies—of a magico-religious nature—were performed in connection with fishing and cultivation, close connection between sexual activity and agricultural success finding expression in rites of a peculiar nature.

There is a belief in a class of powerful beings, most of which are mischievous but stupid, though some are good. Beliefs are vague. That of transmigration into animals has been recorded. Another is that the soul leaves the body at death and goes to an unknown island in the west. Some return and even marry mortals. Various forms of divination were employed. Spirits appeared in dreams; hero cults are recorded and of the Western Islands it is stated that they "had no deities or conception of a Supreme God." Ancestors are believed to control the food supply, and if customs are broken, withhold their favour.

Products.—Yams, taro and sweet potatoes constitute in some districts the main food of the people, while in others sago is the staple diet. Forest fruits and vegetables are also eaten. Maize and rice—which are not indigenous—are eagerly sought after. The Papuan varies his vegetable diet with the flesh of the wild pig, wallabi and other small animals, which are hunted with dogs. Birds are snared or limed. Fish abound at many parts of the coast, and are taken by lines, or speared at night by torch-light, or netted, or a river is dammed and the fish stupefied with the root of a milletia. Turtle and dugong are caught. The kima, a great mussel weighing (without shell) 20 to 30 lb., and other shellfish, are eaten, as are also dogs, flying foxes, lizards, beetles and all kinds of insects. Food is cooked in various ways. Cooking-pots, made at various parts of the coast, form one of the great exchanges for sago; but where such vessels do not reach, food is cooked by the women on the embers, done up in leaves, or in holes in the ground over heated stones. The sexes eat apart. In the interior salt is difficult to get, and sea-water, which is carried inland in hollow bamboos, is used in cooking in place of it. Salt, too, is obtained from the ashes of wood saturated by sea-water. In the Fly River region, kava, prepared from *Piper methysticum,* is drunk without any of the ceremonial importance associated with it in Polynesia. As a rule the Papuans have no intoxicating drink and do not know the art of fermenting palm-sap or cane-juice. Tobacco is indigenous in some parts, and is smoked everywhere, except on the north-east coast and on the islands.

Clothing and Ornaments.—The Papuan's chief home-made ornaments are necklaces, armlets and ear-rings of shells, teeth or fibre, and cassowary, cockatoo, or bird of paradise feathers—the last two, or a flower, are worn through the septum of the nose. With his head encircled by a coronet of dogs' teeth, and covered with a network cap or piece of bark-cloth, the septum of the nose transfixed by a pencil of bone or shell, and perhaps a shell or

fibre armlet or two, the Papuan is in complete everyday attire. On festal occasions he decks his well-forked-out and dyed hair with feathers and flowers, and sticks others in his ear-lobe holes and under his armlets; while a warrior will have *ovula* shells and various bones of his victims dangling from ringlets of his hair, or fixed to his armbands or girdle. The Papuan comb is a long piece of bamboo split at one end into prongs, while the other projects beyond the forehead sometimes two feet or more, and into it are stuck the bright feathers of parrots and other birds. The fairer tribes at the east end tattoo. Men are not tattooed till they have killed some one. Raised cicatrices usually take the place of tattooing with the darker races.

The Papuans build excellent canoes and other boats, and in some districts there are professional boat-builders of great skill, though in others this is now a lost art These boats are either plain dug-outs, with or without outriggers, or regularly built by planks tightly laced and well caulked to an excavated keel. The "lakatoi" is composed of several capacious dug-outs, each nearly 50 ft. long, which are strongly lashed together to a width of some 24 ft., decked and fitted with two masts, each carrying a huge mat sail picturesquely fashioned. On the deck high crates are built for the reception of pottery for conveyance annually to the Fly River district to exchange for sago

Papuans use Pan-pipes, a Jew's harp of the Papuans' own fabrication, and the flute; on occasions of ceremony the drum only is used—this instrument being always open at one end and tapped by the fingers. To the accompaniment of the drum, dancing almost invariably goes, but rarely singing All sorts of jingling sounds also are music to the ear, especially the clattering in time of strings of beans in their dry shells

Nearly all Papuan houses are built on piles, and this not only on the coast but on the hillsides In the north, the east and south-west of the island immense communal houses (*morong*) are met with. Some of these are between 500 and 700 ft in length, with a rounded, boat-shaped roof thatched with palm-branches, and looking inside, when undivided, like dark tunnels. In some districts the natives live together in one of these giant structures, which are divided into compartments. As a rule elsewhere each family has its independent dwelling On the north coast the houses are not built on piles; the walls, of bamboo or palm branches, are very low, and the projecting roof nearly reaches the ground; a barrier at the entrance keeps out pigs and dogs. A sort of table or bench stands outside, used by the men only, for meals and for the subsequent siesta In east New Guinea sometimes the houses are two-storeyed, the lower part being used for stores. The ordinary house is 60 to 70 ft. long, with a passage down the centre, and stands on a platform or veranda raised on piles, with the ridge-pole projecting considerably at the gables so that the roof may cover it at each end Inland villages are often situated on hills or on top of steep-faced rocks as difficult of access as possible, whence a clear view all round can be had, or the village is protected by high palisades and by fighting platforms on trees commanding its approaches The "dobbos" are tree-houses, built in high trees On the north-east coast many of the villages are tastefully kept, their whole area being clean swept, nicely sanded, and planted with ornamental shrubs, and have in their centre little square palaver places laid with flat stones, each with an erect stone pillar as a back-rest. Excellent suspension bridges span some of the larger rivers

Weapons and Tools.—Papuan weapons are the bow and arrow (in the Fly River region, the north and north-east coasts); a knife of a sharp segment of bamboo; a shafted stone club—rayed, disc-shaped or ball-headed (in use all over the island); spears of various forms, pointed and barbed; the spear-thrower (on the Finsch coast), and hardwood clubs and shields, widely differing in pattern and ornamentation with the district of their manufacture. The Papuan bow is rather short, the arrows barbed and tipped with cassowary or human bone. The Papuans were mostly ignorant of iron, but work skilfully with axes of stone or tridacna shell and bone chisels, cutting down trees 20 in. in diameter. Two men working on a tree trunk, one making a cut with the adze lengthwise and the other chopping off the piece across, will soon hollow out a large canoe. Every man has a stone axe, each village generally owning a large one. Their knives are of bamboo hardened by fire In digging they use the pointed stick. In British New Guinea alone is the man-catcher (a rattan loop at the end of a handle with a pith spike projecting into it) met with. For war the men smear themselves in grotesque fashion with lime or ochres, and in some parts hold in their teeth against the chin a face-like mask, supposed to strike terror into the foe, against whom they advance warily (if not timidly), yelling and blowing their war-trumpets The war canoe (which is a long, narrow dug-out outrigger, capable of holding 28 men) is only a transport, for they never fight in it. The conch-shell is the trumpet of alarm and call to arms.

PAPYROLOGY. Papyrology means the science or study of papyri, but as commonly understood the scope of this study is narrowed on one side and widened on another The papyri found in Egypt—which country, except for the charred rolls of Herculaneum, has hitherto been their only source—are written in a variety of scripts and languages: ancient Egyptian in its progressive stages of Hieroglyphic, Hieratic, Demotic and Coptic in Hebrew and Aramaic, in Syriac, Persian and Arabic, as well as in Greek and Latin. Papyrology, however, and its foreign equivalents, Papyrologie, Papirologia, Pápyrusforschung, etc., have come to be associated with papyri written in the two classical languages, especially Greek, which is far commoner than Latin, and limit themselves to the Graeco-Roman period of Egyptian history On the death of Alexander the Great, who had occupied Egypt in 332 B C, Ptolemy Soter I, the founder of the Ptolemaic dynasty, became satrap and subsequently king Thenceforward, till the Arab invasion in the middle of the seventh century, Greek was the official language of the country Under the earlier Ptolemies Greek-speaking settlers were introduced in considerable numbers, and by degrees the Greek language and literature became so widely diffused and firmly rooted that their predominance remained unchallenged when Egypt was incorporated in the empire of Rome Literary fragments in Latin are rare, and for documentary purposes that language was little used except in military and legal business and in private correspondence between Roman officials themselves. After the Arab conquest Greek continued for a while to be officially employed side by side with Arabic, and then gradually died out Greek, then, is the language with which the papyrologist is primarily concerned. He will not of course neglect the evidence derived from contemporary documents in Demotic, Coptic, or Arabic, but the decipherment and interpretation of oriental scripts are left to specialists in those tongues Though thus circumscribed, however, on the one hand, on the other the term papyrology is somewhat loosely allowed to comprehend those analogous Greek or Latin texts which are found in Egypt inscribed on substances other than papyrus—parchment, leather, wood, bone, fragments of limestone and especially broken pottery or ostraca, which were very often used for short receipts and similar purposes Inscriptions on stone are excluded, these form the material of the kindred science of epigraphy. The first professorship of papyrology was established in 1908 at Oxford

HISTORY OF THE DISCOVERY OF PAPYRI

18th Century.—Herculaneum.—The first discovery of Greek papyri, of which we have record, was made at Herculaneum, where in 1752 the charred remains of a library were found, consisting almost entirely of philosophical works, mostly by Philodemus, an Epicurean contemporary of Cicero, others by Epicurus himself or writers of his school Copies of some of these were edited by Walter Scott (*Fragmenta Herculanensia*, 1885), others have been published in Italy. That find is as yet an isolated event

In Egypt Greek papyri first made an appearance in 1778, when a European merchant bought one of a number of rolls said to have been unearthed at Gizeh. The rest were torn up by the native finders and burned for the sake of their aromatic smell. Such is the picturesque but not very convincing story. That the home of the discoverers was Gizeh no one familiar with that village will doubt. As the place of discovery, however, the Fayûm (the ancient Arsinoite nome), is plainly indicated by the contents of the single surviving roll.

Early 19th Century.—About 1820 further appreciable finds began to be made. In the decade from 1815 to 1825 several groups of documents, many of the second century B.C., were unearthed, chiefly at Memphis and Thebes, and for the most part found their way to the museums of London, Paris, Turin, Vienna and Leyden. The Turin section was edited by Amadeo Peyron in 1826, and the others were brought out in more or less successful form during the next forty years. The first literary papyrus obtained from Egypt was a roll containing Book XXIV. of the *Iliad,* bought by William Bankes in 1821 and passed on by him to the British Museum. That institution also acquired in 1847 the papyrus of a lost classic which contains three orations of Hyperides, and subsequently the Funeral Oration of the same orator, which followed in 1856.

Late 19th Century.—The sporadic finds just described, though important, were relatively sparse, and it was only in the last quarter of the century that the great possibilities of Egypt as a source of papyri became fully apparent. The second period in the history of papyrus discovery began in 1877 and lasted for rather less than twenty years. It was marked by very large finds made in the ruins of Arsinoë and other places in the Arsinoite nome, and of Heracleopolis and Hermopolis, farther south in the Nile valley. Many of these finds were the accidental fruits of digging in the ancient mounds for *sebakh, i.e.,* nitrous earth which is extensively used by the natives as a fertilizer. The *fellahin* had gradually awakened to the fact that papyrus was a marketable commodity, so that what formerly passed unheeded came to be more or less carefully preserved and handed on to dealers in antiquities. Other discoveries were the outcome of work undertaken by the dealers themselves, or by mere plunderers. The united result was a copious and fairly constant stream which flowed mainly to London, Berlin and Vienna. During this period, in the winter of 1889, Prof. (now Sir Flinders) Petrie, excavating at Gurob in the Fayûm, came upon some mummies of the early Ptolemaic age, in the cartonnages of which papyrus had been used in place of cloth (*see* below). About the same time the British Museum purchased a most important group of literary papyri, including Aristotle's treatise on the Constitution of Athens, the Mimes of Herondas, and part of the oration of Hyperides against Philippides, while another speech of Hyperides, that against Athenogenes, was acquired by the Louvre.

Scientific Excavations.—The earlier discoveries outlined above proceeded almost entirely from the unskilled work, sometimes authorized but often illicit, of natives, whose desultory methods involved much damage and loss. Those of the latest period, now in progress, have largely been the product of systematic exploration superintended by properly qualified Europeans. In the winter of 1895–96 the first expedition of such a kind, definitely undertaken for the discovery of papyri, was conducted on behalf of the Egypt Exploration Fund (now Society) by Drs. D. G. Hogarth, B. P. Grenfell and A. S. Hunt in the north of the Fayûm. Its results, subsequently published in *Fayûm Towns and their Papyri,* justified further efforts, and in the following season an enormous find was made by Grenfell and Hunt in the mounds of Behnesa, the ancient Oxyrhynchus, once the capital of a province. Among their earliest discoveries there was a leaf containing new sayings of Jesus, which were published in a brochure under the title of *Logia* in 1897. Prompted by this success the Society founded in that year a Graeco-Roman branch with a view to systematic publication of what had already been secured as well as to further exploration. Work was carried on by the same pair at various sites in the Fayûm, at El Hibeh in the Nile valley, and for five more seasons at Behnesa, and subsequently by Mr. John Johnson on the sites of Heracleopolis, Aphroditopolis and Antinoë. French scholars conducted excavations in the Fayûm and middle Egypt (1901–4); Germans at Heracleopolis (1898–99), Elephantine, Hermopolis, Abusîr at the entrance to the Fayûm, and in the Fayûm itself; Italians at Hermopolis (1903) and later at Oxyrhynchus, while at Aphroditopolis a representative of the Cairo Museum made one of the most notable of recent discoveries, remains of a papyrus book containing comedies of Menander (1905). Meanwhile native digging, though overshadowed, was not suspended, and papyri from that source continued to be offered for sale. A most important literary acquisition, the Bacchylides papyrus, came in this way to the British Museum at the end of 1896. Another highly valuable find of a different character occurred in 1915, consisting of a very extensive group of documents known as the archives of Zenon, in which the central figure is an official of the third century B.C. The lion's share of this was obtained by the Museum of Cairo, but large sections have gone also to the British Museum and Florence, and a sprinkling to the United States. Since the interruption caused by the World War little in the way of scientific excavation has been attempted, except by an American expedition from Michigan university which has worked for several winters in the Fayûm on the site of the ancient Karanis, and discoveries by natives, either in the course of their agricultural operations or by less legitimate means, have again become the chief source of supply. Of the material recently placed on the market much has been secured by institutions in the United States, whose active participation both in field work and purchases marks a new departure in papyrology.

CONDITIONS OF DISCOVERY

Ancient Houses and Rubbish Mounds.—Of the papyri recovered hitherto, the bulk has proceeded from the ruins of ancient towns and villages. They may be found in deserted houses, where useless or forgotten papers were left lying about or perhaps put by for safety in a pot or other receptacle. Such conditions have been exemplified in sites on the edge of the Fayûm desert. Papyri are to be found, again, in mere rubbish heaps, where waste paper was thrown away along with other house refuse. These piles of ancient rubbish may be the growth of several centuries, and may rise to a height of some 30 feet.

Cemeteries.—A second principal source is tombs. Books or papers were occasionally buried with their dead owners, and valuable literary finds have sometimes been made in this way, *e.g.,* the *Persae* of Timotheus, which was found by German excavators at Abusîr. Moreover, in the Ptolemaic period waste papyrus was often employed in the process of mummification. It was the fashion to decorate human mummies with pieces of painted cartonnage, in the composition of which papyrus was a common ingredient. By removing the overlying plaster and paint and separating the layers the documents used may be recovered in a more or less legible condition. The Petrie Papyri, as mentioned above, and many others since, were so obtained. Sometimes, too, waste paper was utilized in the mummification of crocodiles and other sacred animals. The discovery of papyri in mummified crocodiles was first made by Grenfell and Hunt in the Fayûm when working for the University of California; over 250 texts derived from this source were published in *Tebtunis Papyri,* vol. i.

COLLECTIONS AND CLASSES OF PAPYRI

As a result of the large production during the past generation papyri are now widely distributed, and very many museums and libraries possess at least a few specimens. The chief repositories are the British Museum, Oxford (the Bodleian library and Queen's college), Paris, Berlin, Vienna and Cairo. In Europe more or less extensive and valuable collections are to be found in the Rylands library at Manchester, in Cambridge, Aberdeen, Trinity college at Dublin, Strasbourg, Leyden, Heidelberg, Leipzig, Hamburg, Bremen, Giessen, Frankfurt, Halle, Wurzburg, Munich, Graz, Geneva, Basle, Florence, Turin and Oslo. In the United States the Universities of California and Michigan are especially prominent, and collections exist also at Princeton, Cornell, Columbia, Wisconsin and elsewhere. In Egypt besides the large accumu-

EXCAVATIONS IN EGYPT AND SPECIMENS OF PAPYRI FOUND

1. Digging for papyri at Behnesa (the ancient Oxyrhynchus), Egypt, showing a trench at the foot of a mound. In 1897 a great find of papyri was made on this site by Drs. Grenfell and Hunt, among their earliest discoveries being a leaf containing new sayings of Christ

2. *Left:* transliteration of fragment of a roll containing poems of Sappho (Oxyrh. Pap: 1787) 3rd century; this column gives remains of three poems, marked off by a *coronis* in the margin. *Right:* part of a letter "to my brother Heracleides" written in the 13th year of Tiberius A.D. 27 (Oxyrh. Pap: 2148). *Below:* A formal invitation. 3rd century. "Eudaemon invites you to dine at the Gymnasium in celebration of the crowning (i.e., entry upon some civic office) of his son on the 1st at the 8th hour." (Oxyrh. Pap. 2147) (Reduced facsimiles)

3. Natives searching for papyri among the debris of a rubbish mound. The natives appreciate the market value of papyri and illicit digging for specimens is sometimes carried on. The finds are all sold to antique dealers

4. Late stage of trench in a rubbish heap. The piles, formed of the accumulated refuse of centuries, are sometimes over 30 feet high and require careful trenching and sifting in the search for papyri

5. Head pieces and breast pieces of painted mummy cartonnage made of waste papyrus excavated in the Fayum, Egypt. In the Ptolemaic period (4th century B.C. and later) papyrus was often employed in mummification

lation at Cairo there are some papyri in the museum at Alexandria.

In a classification of papyri the main line of demarcation is between literary and non-literary. Sometimes indeed a doubt arises as to which class a text belongs, *e.g.*, a medical recipe may be an extract from a book or a private formula. Sometimes, again, a group, though including elements falling in both the above categories is homogeneous enough to be most suitably treated as a whole. Such a group is formed by the magical papyri.

I. Literary Papyri: Recovery of Lost Works.—The literary section falls in turn into two main groups, the new and the extant, and within these a number of subdivisions are conveniently made. Of the new contributions to literature the following may be regarded as the most important. In the sphere of theology the chief items are the Cairo fragments on vellum of the Gospel and Apocalypse of Peter (edited with facsimile by G. v. Gebhardt, 1893) and the two series of Sayings of Jesus, found at Oxyrhynchus and published in 1897 and 1904. In classical literature, lyric poetry has been decidedly fortunate. Besides Bacchylides (first edited by F. G. Kenyon, 1897) there are new poems of Pindar (Oxyrh. Pap. 659, 841), numerous fragments of Sappho and Alcaeus (Oxyrh. Pap. 7, 1231–4, 1787–9, *Berl. Klassikertexte* V. 12–13), and substantial pieces of Alcman, Ibycus and Corinna (Pap. du Louvre 71, Oxyrh. Pap. 1790, *Berl. Klassikertexte* V. 14). Drama can count three notable acquisitions, the greater part of the *Ichneutae* of Sophocles (Oxyrh. Pap. 1174), which for the first time affords a fair idea of a Sophoclean Satyr-play, extensive remains of the *Hypsipyle* of Euripides (Oxyrh. Pap. 852), and large portions of several plays of Menander (ed. 1 by G. Lefèbvre, 1907). Among later poets, important additions have been made to the remains of Callimachus and to the few extant specimens of the Greek mime through the discovery of the Mimes of Herondas. The Mimiambi of Cercidas (Oxyrh. Pap. 1082) and the *Persae* of Timotheus also deserve notice; the latter has the distinction of being probably the most ancient Greek literary manuscript yet known. In history, Aristotle's *Athenian Constitution* (ed. 1 by F. G. Kenyon, 1891) is an authority of the first rank, and perhaps the chief prize brought by the papyri so far. A second acquisition of much value though of smaller compass is the so-called *Hellenica Oxyrhynchia* (Oxyrh. Pap. 842), the author of which is not determined with certainty but not improbably was Ephorus. In any case the fragment is of importance not only for the new information which it contains but also for its bearing on the work of Diodorus Siculus. A life of Euripides by Satyrus (Oxyrh. Pap. 1176), written in the form of a dialogue, is an interesting specimen of popular biography. An epitome of some of the lost books of Livy (Oxyrh. Pap. 668) constitutes the chief literary find in Latin. In the department of oratory, the six surviving speeches, or remains of speeches, of Hyperides, have all been found in Egypt.

Long Survival and Wide Dissemination of Greek Literature.—The multifarious literary remnants preserved in the papyri are a striking testimony to the popularity and diffusion of the Greek classics in Egypt. Not till a comparatively late period does their decline become marked—a decline traceable partly to material decay and waning culture, partly, too, to the spread of Christianity, which tended to divert attention to theological writings. Down to about the end of the third century the loss of great works does not seem to have gone very far. This consideration should lead to increased respect for tradition. If the materials available continued to be so large, statements of fact are not to be lightly dismissed even when they come from comparatively late writers. To invent where information lay ready to hand would be ridiculous. Some signal examples of the futility of a certain kind of scepticism may be seen in the papyri. For instance, the late Latin treatise on the Fall of Troy attributed to Dictys Cretensis begins with a statement that the book was a translation from Greek. A recent editor, rejecting that plain affirmation, decided that the Greek original was mythical. A good-sized piece of this original has since been found.

Extant Literature: (a) Biblical.—A second principal class of literary papyri consists of those representing works already extant. Of the Greek Bible there are numerous early fragments, and both for the Old and the New Testament the oldest manuscripts known are among the papyri. And they are not always mere fragments. From Egypt has lately come a well preserved book in the ancient binding containing a copy (on vellum), written probably in the fifth century, of the four Gospels (edited by H. A. Sanders, 1912). This is known as the Freer manuscript, from the name of the purchaser, and is now in Washington. It differs from all others in the last chapter of St. Mark, where it gives a passage otherwise known only from a partial quotation in Latin by Jerome. Another Freer manuscript of considerable compass, a papyrus book, perhaps of the early fourth century, containing most of the Minor Prophets, was edited by the same scholar in 1927 along with a Berlin papyrus covering the greater part of Genesis and probably still earlier in date.

(b) Classical Authors.—Of the more familiar Greek classical writers not very many now remain quite unrepresented; the Latin authors are comparatively rare, but fragments of Virgil, Cicero, Livy, Sallust, Gaius and other jurists have been recovered. Valuable textual evidence, often many centuries older than that which was previously available, has thus been obtained. Here again a general confirmation of tradition is a primary and satisfactory result. The papyri bring a certain number of minor improvements of reading, but prove that no serious deterioration occurred during the middle ages, and that the classical texts have been handed down to us substantially as they stood in the first centuries of the Christian era. Secondly, the earlier papyri commonly show what has been termed an eclectic type of text, that is to say, they are seldom found to support at all consistently a single ms. or group of mss. but instead agree now with one, now another. An editor should therefore beware of attaching too much weight to one ms. or family; readings are to be judged on their own merits rather than on the general qualities of their source. Thirdly, the methods of the best modern scholarship have received from the papyri encouraging support.

II. Non-literary Papyri.—The non-literary or documentary papyri naturally form an overwhelming proportion of the entire mass. A rough computation made at the end of 1927 put the total of published documents, including ostraca, in the neighbourhood of 12,000, and large numbers which have been found have yet to be edited. The earliest dated Greek papyrus so far known is a marriage-contract of the year 311 B.C., and each century from the third B.C. to the eighth A.D. is now more or less copiously represented. A documentary material is here presented which for extent and variety is unmatched in any other archaeological department. Considered according to their subject-matter these papyri fall into two main classes, the official and the private, each of them including numerous subordinate groups. Under the former head come copies of laws, rescripts, edicts, records of official acts, reports of judicial proceedings and other kinds of public business, correspondence, assessments and receipts of taxes, inventories, accounts and the like. In this class also are most conveniently placed documents which though emanating from private persons were addressed to officials, such as petitions, etc.

Subjects Illustrated: (1) History.—The historian may reap a rich harvest in several directions. For the Ptolemaic dynasty valuable evidence is forthcoming, and fresh light has also been thrown on the chronology of some of the Roman emperors. Other direct contributions to political history, though not frequent, are occasionally made; for instance, a recently published letter of the emperor Claudius to the people of Alexandria (H. I. Bell, *Jews and Christians in Egypt*, 1926), in which he states his views about the attribution to himself of divine honours, shows that at the beginning of his reign, at any rate, Claudius was as much averse from extravagant pretensions as any of his predecessors. In an Oxyrhynchus papyrus, again, is preserved the proclamation which announced to the locality the decease of this same emperor, Claudius, and the accession of Nero.

Local Administration, etc.—But it is in the less prominent sphere of internal administration and economic, industrial and social conditions that the historical import of these business papers is especially striking. Here they are a prime source of information; and their significance is by no means limited to Egypt,

though of course local evidence must be applied with caution to other parts of the Graeco-Roman world. Sometimes individual documents may prove particularly instructive, as for instance the so-called Revenue Papyrus (edited by B. P. Grenfell, 1896), which reveals the highly complicated details of the working of an important State monopoly in the third century B.C.; or a document of the same period from Hibeh, in which is exhibited the elaborate organization of the official postal service.

Social Life, etc.—With regard to the material conditions in which people lived, their culture, education, religion, habits and amusements, the papyri are a mine of information. This is one of their more immediately attractive sides, and nowhere are their peculiar qualities and significance more evident. Much private correspondence is found, and in this and the equally numerous petitions, contracts, accounts, etc., may be seen an almost endless variety of intimate and unposed scenes of common life. In one letter a person in financial difficulties is warned to beware of moneylenders; in another, a father describes how, egged on by his wife and daughter, he got his son transferred from the infantry into the cavalry; in another a prodigal confesses that he had brought himself to destitution and begs for forgiveness. There are formal invitations, couched, like those of to-day, in the third person, to dinner; lists of viands; contracts with musicians and other artistes who were engaged to perform on festive occasions; an order for an inquest on a slave who had fallen from a house in an endeavour to get a good view of some dancing-girls; athletic diplomas; a list of articles in pawn; a question addressed to the local oracle about a man's matrimonial prospects; the complaint of an outraged wife that her husband had locked her out of doors: these are a few samples of a material from which a realistic picture may be made.

(2) **Law.**—The legal side of the papyri is also of much importance. Both Greek law, which came to Egypt with the Ptolemaic dynasty, and Roman law, which was afterwards engrafted upon the earlier system, obtain in them valuable evidence and illustration. As in the department of history, single texts of special interest sometimes occur, *e.g.*, a papyrus at Halle which preserves in eleven columns a number of ordinances in force at Alexandria in the third century B.C. (*Dikaiomata*, 1913), or a still larger text of the Roman period at Berlin, which is a kind of manual for the guidance of the minister of finance (*Gnomon des Idios Logos*, 1919). But here again much is to be gleaned from the multifarious edicts, reports of judicial proceedings, petitions, wills, contracts and other such papers.

(3) **Philology.**—Another subject having a considerable debt to acknowledge is philology. In the new edition of Liddell and Scott's Greek lexicon, now in course of publication, there are many references to the papyri; and they figure prominently in every page of Moulton and Milligan's *Vocabulary of the New Testament*. It is indeed in its bearing upon what has been miscalled "Biblical Greek" that the linguistic evidence of the documents has proved to be especially illuminating. They have shown that the supposed peculiarities of the Greek of the New Testament were illusory; its vocabulary and syntax reappear in the documentary papyri, where are found many of the words and constructions formerly explained as due to Semitic influence. In short, the New Testament, like the papyri, merely reflects the vernacular of the day.

Numismatics and Metrology are also subjects which find valuable data in the papyri, where, naturally, money matters are a constantly recurring topic, and references to weights and measures are frequent. Occasionally tables drawn up for purposes of reference or for committing to memory are found.

Palaeography.—The palaeography of papyri, both literary and documentary, is dealt with elsewhere (*see* PALAEOGRAPHY: *Greek*). For the history of Greek writing they are of course highly important. In the literary and cursive hands of the papyri is to be found the origin of the uncial and minuscule scripts of the vellum codices, and the date and source of the older of these have sometimes to be revised in the light of the papyrus evidence. A useful contribution is made also to Latin palaeography.

(1925–27); H. J. M. Milne, *Catalogue of literary Papyri in the British Museum* (1927).

Collections of new literary texts.—J. M. Edmonds, *The New fragments of Alcaeus, Sappho and Corinna* (1909); A. S. Hunt, *Tragicorum fragmenta papyracea* (1912); E. Diehl, *Suppl Sophocleum* (1913); H. von Arnim, *Suppl. Euripideum* (1913); K. Jander, *Oratorum et rhetorum fragmenta* (Bonn, 1913); O. Schroeder, *Novae Comoediae fragmenta exceptis Menandreis* (Bonn, 1915); E. Diehl, *Suppl. Lyricum* (3rd ed., 1917); R. Pfeiffer, *Callimachi fragmenta nuper reperta* (1921); F. Bilabel, *Die kleineren Historikerfragmente auf Papyrus* (1923). Many texts from the papyri are also included in such books as the following: J. M. Edmonds, *Lyra Graeca* (1922–27); E. Lobel, *The Fragments of Sappho* (1925); J. U. Powell, *Collectanea Alexandrina* (Oxford, 1925), and E. Lobel, *The Fragments of the Lyrical Poems of Alcaeus* (1927).

Selections of non-literary Texts.—G. Milligan, *Selections from the Greek Papyri* (Cambridge, 1910); S. Witkowski, *Epistulae privatae Graecae aet. Lagidarum* (Leipzig, 1911); U. Wilcken and L. Mitteis, *Grundzüge u. Chrestomathie der Papyruskunde* (1912); G Ghedini, *Lettere cristiane del iii. et iv. secolo* (1913); P. M. Meyer, *Juristische Papyri* (1920) and a selection for the Loeb series now in preparation.

Papyrological periodicals.—*Archiv für Papyrusforschung*, edit. U. Wilcken (1901 *et seq.*); *Aegyptus*, edit. A. Calderini (1920 *et seq.*).
(A. S. H.)

PAPYRUS (păp-ī′rŭs), the paper reed, the *Cyperus Papyrus* (Linn.) in ancient times cultivated in the Delta of Egypt, where it was used for various purposes, and especially as a writing material. The plant is now extinct in Lower Egypt, but is found in the Upper Nile regions and in Abyssinia. The first accurate description of the plant is given by Theophrastus, from whom we learn that it grew in shallows of 2 cubits (about 3 ft.) or less, its main root being of the thickness of a man's wrist and 10 cubits in length. From this root, which lay horizontally, smaller roots pushed down into the mud, and the stem of the plant sprang up to the height of 4 cubits, being triangular and tapering in form.

The various uses to which the papyrus plant was applied are

also enumerated by Theophrastus. Of the head nothing could be made but garlands for the shrines of the gods; but the wood of the root was employed in the manufacture of different utensils as well as for fuel. Of the stem of the plant were made boats, sails, mats, cloth, cords, and, above all, writing materials. Its pith was also a common article of food, and was eaten both cooked and in its natural state. Herodotus, too, notices its consumption as food, and incidentally mentions that it provided the material of which the priests' sandals were made. He likewise refers to its use as tow for caulking the seams of ships. That the plant was itself used also as the principal material in the construction of light skiffs suitable for the navigation of the pools and shallows of the Nile, and even of the river itself, is shown by sculptures of the fourth dynasty, in which men are represented building a boat with stems cut from a neighbouring plantation of papyrus. It is to boats of this description that Isaiah (xviii. 2) probably refers in the "vessels of bulrushes upon the waters."

PAPYRUS (CYPERUS PAPYRUS), SHOWING RIVERSIDE PLANT WITH SHOOTS 3–12 FT. HIGH

A. Single flower showing 3 stamens and trifid stigma. B. Single floral spike. (A and B enlarged)

The widespread use throughout the ancient world of the writing material manufactured from the papyrus plant is attested by early writers, and by documents and sculptures. Papyrus rolls are represented in ancient Egyptian wall-paintings; and extant examples of the rolls themselves are sufficiently numerous. The early use of papyrus among the Greeks is proved by the reference of Herodotus to its introduction among the Ionian Greeks, who gave it the name of διφθέραι, "skins," the material to which they had already been accustomed. In Athens it was doubtless in use for literary as well as for other purposes as early as the 5th century B.C. An inscription relating to the rebuilding of the Erechtheum in 407 B.C. records the purchase of two papyrus rolls.

Papyrus also made its way into Italy, but at how early a period there is nothing to show. It may be presumed, however, that from the very first it was employed as the vehicle for Roman literature. Under the Empire its use must have been extensive, for not only was it required for the production of books, but it was universally employed for domestic purposes, correspondence and legal documents.

The account which Pliny (*N.H.* xiii. 11–13) has transmitted to us of the manufacture of the writing material from the papyrus plant should be taken strictly to refer to the process followed in his own time; but, with some differences in details, the same general method of treatment had doubtlessly been practised from time immemorial. His text, however, is so confused, both from obscurity of style and from corruptions in the mss., that there is much difference of opinion as to the meaning of many words and phrases employed in his narrative, and their application in particular points of detail. In one important particular, however, affecting the primary construction of the material, there can no longer be any doubt. The old idea that it was made from layers growing between the rind and a central stalk has been abandoned, as it has been proved that the plant, like other reeds, contains only a cellular pith within the rind. The stem was in fact cut into longitudinal strips, those from the centre of the plant being the broadest and most valuable. The strips (*inae, philyrae*) were laid side by side to the required width, thus forming a layer (*scheda*), across which another layer of shorter strips was laid at right angles. The two layers thus "woven"—Pliny uses the word *texere* in describing this part of the process—formed a sheet (*plagula* or net), which was then soaked in water of the Nile.

The mention of a particular water has caused trouble to the commentators. Some have supposed that certain chemical properties of which the Nile water was possessed acted as a glue or cement to cause the two layers to adhere; others, with more reason, that glutinous matter contained in the material itself was solved by the action of water, whether from the Nile or any other source; and others again read in Pliny's words an implication that a paste was actually used. The sheet was finally hammered and dried in the sun. Any roughness was levelled by polishing with ivory or a smooth shell. But the material was also subject to other defects, such as moisture lurking between the layers, which might be detected by strokes of the mallet; spots or stains; and spongy strips (*taeniae*), in which the ink would run and spoil the sheet. When such faults occurred, the papyrus must be re-made. To form a roll the several sheets were joined together with paste (glue being too hard), but not more than twenty sheets in a roll (*scapus*). As, however, there are still extant rolls consisting of more than the prescribed number of sheets, either the reading of *vicenae* is corrupt, or the number was not constant in all times. The *scapus* seems to have been a standard length of papyrus, as sold by the stationers. The best sheet formed the first or outside sheet of the roll, and the others were joined on in order of quality, so that the worst sheets were in the centre of the roll.

The different kinds of papyrus writing material and their dimensions are also enumerated by Pliny. The best quality, formed from the middle, and broadest strips of the plant, was originally named *hieratica*, but afterwards, in flattery of the emperor Augustus, it was called, after him, *Augusta*; and the *charta Livia*, or second quality, was so named in honour of his wife. The *hieratica* thus descended to the third rank. The first two were 13 digiti, or about $9\frac{1}{2}$ in. in width; the *hieratica*, 11 digiti or 8 in. Next came the *charta amphitheatrica*, named after the principal place of its manufacture, the amphitheatre of Alexandria, of 9 digiti or $6\frac{1}{2}$ in. wide. The *charta Fanniana* appears to have been a kind of papyrus worked up from the *amphitheatrica*, which by flattening and other methods was increased in width by an inch, in the factory of a certain Fannius at Rome. The *Saitica*, which took its name from the city of Sais, and was probably of 8 digiti or $5\frac{3}{8}$ in., was of a common description. The *Taeniotica*, named apparently from the place of its manufacture, a tongue of land (ταινία) near Alexandria, was sold by weight, and was of uncertain width, perhaps from $4\frac{3}{8}$ to 5 in. And lastly there was the common packing-paper, the *charta emporetica*, of 6 digiti or $4\frac{3}{8}$ in. Isidore (*Etymol.* vi. 10) mentions yet another kind, the *Corneliana*, first made under C. Cornelius Gallus, prefect of Egypt, which, however, may have been the same as the *amphitheatrica* or *Fanniana*. In the reign of Claudius another kind was introduced and entitled *Claudia*. The *charta Augusta* was, from its fineness and porous nature, ill suited for literary use; it was accordingly reserved for correspondence only, and for other purposes was replaced by the new paper.

The *charta Claudia* was made from a composition of the first and second qualities, the *Augusta* and the *Livia*, a layer of the former being backed with one of the latter; and the sheet was increased to nearly a foot in width. The largest of all, however, was the *macrocollon*, probably of good quality and equal to the hieratic, and a cubit or nearly 18 in. wide. It was used by Cicero (*Ep. ad Attic.* xiii. 25, xvi. 3). The width, however, proved inconvenient and the broad sheet was liable to injury by tearing. An examination of extant papyri has had the result of proving that sheets of large size, measuring about 12 in., were sometimes used A large class of examples run to 10 in., others to 8 in., while the smaller sizes range from 4 to 6 in. It has been observed that the width of extant rolls of papyrus does not tally satisfactorily with Pliny's measurements. It is possible that the breadth (not the height) of the individual rolls was referred to.

The first sheet of a roll was named πρωτόκολλον; the last, ἐσχατοκόλλιον. Under the Romans, the former bore the name of the *comes largitionum*, who had control of the manufacture, with the date and name of place. It was the practice to cut away the

portion thus marked; but in case of legal documents this mutilation was forbidden by the laws of Justinian. On the Arab conquest of Egypt in the 7th century, the manufacture was continued, and the protocols were marked at first, as it appears, with inscriptions in both Greek and Arabic, and later in the latter language alone. There are several examples extant, some being in the British Museum, ranging between the years 670 and 715. The Arab inscriptions are accompanied by curious scrawls on each side, which may be imitated from words used in the Latin inscriptions of the Roman period.

Papyrus was cultivated and manufactured for writing material by the Arabs in Egypt down to the time when the growing industry of paper in the 8th and 9th centuries rendered it no longer a necessity. (*See* PAPER.) It seems to have entirely given place to paper in the 10th century. Varro's statement, repeated by Pliny, that papyrus was first made in Alexander's time, should probably be taken to mean that its manufacture, which till then had been a government monopoly, was relieved from all restrictions. It is not probable, however, that it was ever manufactured from the native plant anywhere but in Egypt. At Rome there was certainly some kind of industry in papyrus, the *charta Fanniana,* already referred to, being an instance in illustration. But it seems probable that this industry was confined to the re-making of material imported into Italy, as in the case of the *charta Claudia.* This second manufacture, however, is thought to have been detrimental to the papyrus, as it would then have been in a dried condition requiring artificial aids, such as a more liberal use of gum or paste, in the process. The more brittle condition of the Latin papyri found at Herculaneum has been instanced as the evil result of this re-making of the material.

As to cultivation of the plant in Europe, according to Strabo the Romans obtained the papyrus plant from Lake Trasimene and other lakes of Etruria, but this statement is unsupported by any other ancient authority. At a later period, however, a papyrus was cultivated in Sicily, which has been identified by Parlatore with the Syrian variety (*Cyperus syriacus*), far exceeding in height the Egyptian plant, and having a more drooping head. But in the 13th century it began to fail, and in 1591 the drying up of the Papireto caused the extinction of the plant in that district. It is still to be seen at Syracuse, but it was probably transplanted thither at a later time, and reared only as a curiosity, as there is no notice of it to be found previous to 1674.

Even after the introduction of vellum as the ordinary vehicle for literature papyrus still continued to some extent in use outside Egypt, and was not entirely superseded until a late date. It ceased, however, to be used for books sooner than for documents. In the 5th century St. Augustine apologizes for sending a letter written on vellum instead of the more usual substance, papyrus (*Ep.* xv.); and Cassiodorus (*Varr.* xi. 38), writing in the 6th century, indulges in a high-flown panegyric on the plant and its value. Of mediaeval literary Greek papyri very few relics have survived, but of documents coming down to the 8th and 9th centuries many are being brought to light among the discoveries in Egypt.

Mediaeval Latin mss. on papyrus in book form are still extant in different libraries of Europe, viz.: the Homilies of St. Avitus, of the 6th century, at Paris; Sermons and Epistles of St. Augustine, of the 6th or 7th century, at Paris and Geneva; works of Hilary, of the 6th century, at Vienna; fragments of the Digests, of the 6th century, at Pommersfeld; the Antiquities of Josephus, of the 7th century, at Milan; Isidore, *De contemptu mundi,* of the 7th century, at St. Gall; and the Register of the Church of Ravenna, of the 10th century, at Munich. The employment of this material in Italy for legal purposes is sufficiently illustrated by the large number of documents in Latin which were preserved at Ravenna, and date from the 5th to the 10th century. In the papal chancery it was used at an early date and in the 10th century papyrus was used, to the exclusion of other materials, in papal deeds. In France it was a common writing substance in the 6th century (Gregory of Tours, *Hist. Franc.* v. 5). Of the Merovingian period there are still extant several papyrus deeds, the earliest of the year 625, the latest of 692. Under Charlemagne and his successors it was not used. By the 12th century the manufacture of papyrus had entirely ceased, as appears from a note by Eustathius in his commentary on the *Odyssey,* xxi. 390.

PAR, technically, a commercial and banking term. When stocks, shares, etc., are purchasable at the price originally paid for them or at their nominal or face value they are said to be *at par.* When the purchase price is higher than the face value, they are *above par,* or *at a premium;* when below face value, they are *below par,* or *at a discount. Par of exchange* is the amount of money in the currency of one country which is equivalent to the same amount in the terms of another, both currencies being of the same metal and of a fixed standard of weight and purity. (*See* EXCHANGE.)

PARÁ or GRÃO PARÁ, a northern state of Brazil, bounded on the north by the three Guianas and the Atlantic, east by the Atlantic and the states of Maranhão and Goyaz, south by Goyaz and Matto Grosso and west by Amazonas. It is the third largest state of the republic, having an area of 443,922sq.m.; pop. (1890), 328,455 (1920) 983,507. The Amazon valley has its outlet to the ocean through the central part of the state, the outlet, or neck, being comparatively narrow and the territory on both sides rising to the level of the ancient plateau that covered this part of the continent. In the north is the Guiana plateau, sometimes called Brazilian Guiana. In the south the country rises in forested terraces and is broken by escarpments caused by the erosion of the northern slope of the great central plateau of Brazil. With the exception of the Guiana highlands, and some grassy plains on the island of Marajó and in some other places, the state is densely forested, and its lowest levels are covered with a network of rivers, lakes and connecting channels.

The rivers of the state may be grouped under three general systems: the Amazon and its tributaries, the Tocantins and its tributaries and the rivers flowing direct to the Atlantic. The Amazon crosses the state in a general E.N E. direction for about 500 miles. Its channels, tributaries, *furos* (arms), *igarapés* (creeks, or literally, "canoe paths"), by-channels and reservoir lakes form an extremely complicated hydrographic system. From the south two great tributaries are received—the Tapajos and Xingú—both having their sources outside the state (*see* AMAZON). The Pará estuary, usually called the Pará river, belongs to the Tocantins, although popularly described as a mouth of the Amazon. Very little Amazon water passes through it except in times of flood. It is connected with the Amazon by navigable tidal *furos,* in which the current is hardly perceptible.

Lying across the mouth of the Amazon and dividing it into three channels are the islands of Caviana and Mexiana, the first 47m. and the second 27m. in length, north-west to south-east, both traversed by the Equator, and both devoted to cattle-raising. Somewhat different in character is the island of Marajó, or Joannes, which lies between the Amazon and Pará estuary. It is 162m. long by 99m. wide, and its area is about 15,000sq.m. This island is only partly alluvial in character, a considerable area on its eastern and southern sides having the same geological formation as the neighbouring mainland. The larger part, the north-western, belongs to the flood-plains of the Amazon, being covered with swamps, forests and open meadows, and subject to annual inundations. There are several towns and villages on the island, and stock-raising has long been its principal industry. Of interest to archaeologists is the largest of its several lakes, called

Arary, in the centre of which is a small island celebrated for its Indian antiquities, chiefly pottery.

Pará is crossed by the Equator, and its climate is wholly tropical, but there is a wide variation in temperature and rainfall. In general, it is hot and dry on the Guiana plateau, and hot and humid throughout the forested region. In the latter, there are two recognized seasons, wet and dry, which differ only in the amount of rainfall, a strictly dry season being unknown. The trade winds, which blow up the Amazon with much force, moderate the heat and make healthy most of the settlements on the great river itself; but the settlements along its tributaries, which are not swept by these winds, are afflicted with malaria. The population is concentrated at widely separated points on the coast and navigable rivers, except on Marajó island, where open country and pastoral pursuits have opened up inland districts. The principal occupation is the collecting and marketing of forest products such as rubber (from *Hevea brasiliensis*), gutta-percha or *balata* (*Mimusops elata*), Brazil nuts (*Bertholetia excelsis*), sarsaparilla (*Smilax*), *cumaru* or tonka beans (*Dipterix odorata*), copaiba (*Copaifera officinarum*), *guaraná* (*Paulinia sorbilis*), *cravo* (an aromatic bark of *Dicypellium caryophillatum*) and many others. In earlier days cotton, sugar-cane, rice, tobacco, cacao and even coffee were cultivated, but the demand for rubber caused their abandonment in most places. Cacao (*Theobroma cacao*) is still cultivated, as also *mandioca* (*Manihot utilissima*) in some localities. Pará produces many kinds of fruits—the orange, banana, *abrico, cajú, abacate* (alligator pear), mango, *sapotilha, fructa de Conde*, grape, etc., besides a large number hardly known beyond the Amazon valley. The pastoral industries were once important in Pará, especially on the islands of Marajó, Caviana and Mexiana, and included the rearing of horses, cattle and sheep. At present little is done in these industries, and the people depend upon importation for draft animals and fresh meat.

Transportation depends largely on river craft, the Pará and Bragança, and its branches being the only railway lines. The capital of the state is Pará, or Belem do Pará, and its history is largely that of this city. Other important towns are Alemaquer (pop. of the municipio [1920] 75,873), on a by-channel of the Amazon; Breves (mun. [1920] 22,678), a river port in the south-west part of Marajó, on a channel connecting the Amazon with the Pará estuary; Bragança (mun. [1920] 44,486), a small town in one of the few agricultural districts of the state, 147m. by rail north-east of Pará, on the river Caeté, near the coast; Obidos (mun. [1920] 26,812), on the north bank of the Amazon at a point called the Pauxis narrows, a little over 1m. wide, attractively situated on a hillside in a healthful locality; and Santarem (1920, 41,546), on the right bank of the Tapajos, 2½m. from the Amazon, dating from 1661, and the most prosperous and populous town between Pará and Manáos.

PARÁ (officially BELEM; sometimes BELEM DO PARÁ), a city and port of Brazil, capital of the State of Pará, and the see of a bishop, on a point of land formed by the entrance of the Guamá river into the Pará (86 m. from the Atlantic), in lat. 1° 28′ S., long. 48° 20′ west of Greenwich. Population of the city and rural districts of the municipality (1920) 236,402. There is a large Portuguese contingent in the population, and the foreign element, engaged in trade and transportation, is also important. The Indian admixture is strongly apparent in the Amazon valley and is noticeable in Pará. A railway, built by the State, runs north-eastward to Bragança (160 m.), on the sea-coast. The Guamá river is enlarged at its mouth to form an estuary called the bay of Guajará, partially shut off from the Pará by several islands and forming the anchorage of the port. The Pará, the estuary mouth of the Tocantins river, is about 20 m. wide here.

The city is built on an alluvial forested plain only a few feet above the level of the river. The climate is hot, but the annual and diurnal changes are remarkably small. The rainfall is about 100 in., well distributed through the year. The plan of the city is regular and, owing to the density of the forest, it has no outlying suburbs. The streets are usually narrow, straight and well paved and most of them end abruptly at the margin of the forest. There are many public squares and gardens, the largest being the Praça Caetano Brandão. The public buildings and institutions are in great part relics of an older régime. The great cruciform cathedral, on the Praça Caetano Brandão, dates from the middle of the 18th century. In the vicinity are the Government and municipal palaces—built by order of Pombal (*c.* 1766), when Portugal contemplated the creation of a great empire on the Amazon.

One of the most notable buildings of the city is the Theatro da Paz (Peace Theatre), which faces upon the Praça da Republica and was built by the Government during the second empire. Other noteworthy buildings are the Caridade hospital, the Misericordia hospital (known as the "Santa Casa"), the military barracks occupying an old convent, and Castello fort, which is a relic of colonial days.

Pará is the entrepôt for the Amazon valley and the principal commercial city of northern Brazil. It is the headquarters of the Amazon Navigation Company, which owns a fleet of 40 river steamers, of 500 to 900 tons, and sends them up the Amazon to the Peruvian frontier, and up all the large tributaries where trading settlements have been established. Transatlantic lines afford regular communication with Lisbon, Liverpool, Hamburg and New York. The port is accessible to large steamers, but only those of light draught can lie alongside the quays. Extensive port improvements have been undertaken.

Pará was founded in 1615 by Francisco Caldeira de Castello-Branco, who commanded a small expedition from Maranhão sent thither to secure possession of the country for Portugal and drive out the Dutch and English traders. The settlement, which he named Nossa Senhora de Belém (Our Lady of Bethlehem), grew to be one of the most turbulent and ungovernable towns of Brazil. Rivalry with Maranhão, the capital of the Amazon dependencies, slave-hunting, and bitter controversies with the Jesuits who sought to protect the Indians from this traffic, combined to cause agitation. In 1641 it had a population of only 400, but it had four monasteries and was already largely interested in the Indian slave traffic. In 1652 the Pará territory was made a separate *capitania*, with the town of Pará as the capital, but it was reannexed to Maranhão in 1654. The final separation occurred in 1772, and Pará again became the capital. The bishopric of Pará dates from 1723.

The popular movement in Portugal in 1820 in favour of a constitution and parliament (Cortes) had its echo in Pará, where in 1821 the populace and garrison joined in creating a government of their own and in sending a deputation to Lisbon. The declaration of Brazilian independence of 1822 and creation of an empire under Dom Pedro I. was not accepted by Pará, partly because of its influential Portuguese population, and partly through jealousy of Rio de Janeiro as the centre of political power.

In 1823 a naval expedition under Lord Cochrane, then in the service of Brazil, took possession of Maranhão, from which place the small brig "Dom Miguel" under the command of Captain John Grenfell was sent to Pará. This officer conveyed the impression that the whole fleet was behind him, and on Aug. 15 the *junta governativa* organized in the preceding year surrendered its authority and Pará became part of the newly created Brazilian empire. An uprising against the new Government soon occurred, which resulted in the arrest of the insurgents, the execution of their leaders, and the incarceration of 253 prisoners in the hold of a small vessel, where all but four died from suffocation.

Conspiracies and revolts followed, and in 1835 an outbreak of the worst elements, made up chiefly of Indians and half-breeds, occurred, known as the "Revolução da Cabanagem," which was chiefly directed against the Portuguese, and then against the Freemasons. All whites were compelled to leave the city and take refuge on neighbouring islands. The Indians and half-breeds obtained the mastery, under the leadership of Antonio and Francisco Vinagres and Eduardo Angelim, and plunged the city and neighbouring towns into a state of anarchy, the population being reduced from 25,000 to 15,000. The revolt was overcome in 1836. The opening of the Amazon to foreign trade in 1867 increased the importance of the city, and its growth went forward steadily as the rubber forests of the Amazon were exploited. With the decline of this industry, however, after the development of plan-

tation rubber in the East Indies, its prosperity has been checked. (A. J. L.)

PARABOLA, in mathematics, a section of a circular cone made by a plane parallel to an element or generatrix. The name was given by Apollonius (*c.* 220 B.C.) to denote the areal equivalence expressed in the modern equation $y^2=4px$. The curve was conceived earlier, probably by Menaechmus (*c.* 350 B.C.), as a section of a right-angled circular cone made by a plane perpendicular to one cone-element, and hence parallel to the opposite element. As thus parallel the plane cannot cut across the cone (as in the ellipse), but extends alongside to infinity (∞). Hence the parabola reaches to ∞, symmetric as to its axis or principal diameter perpendicular to a cone-element at the vertex O. Hence, projectively, the parabola is the conic tangent to the line at ∞ (*See* CONIC SECTION and PROJECTIVE GEOMETRY.)

The curve may be treated in several ways. One regards it as the *common limit* of both the ellipse (*q.v.*) and hyperbola (*q.v.*), as implied in the foregoing. Hence the positional (not magnitudinal) properties of the ellipse and the hyperbola coalesce and reappear in the parabola. Thus the eccentricities of the two are

$$e=\sqrt{(1\mp b^2/a^2)},$$

which become 1 for b^2/a^2 vanishing, b^2/a held finite while a increases to ∞. Hence the usual definition of the parabola—a conic whose *eccentricity* is 1. This e in all conic sections is the fixed ratio between the distances from any point of the curve to a fixed point (*focus, F*) and a fixed line (*directrix, DR*). In both the ellipse and the hyperbola there are two such pairs: (F, DR) and (F', $D'R'$), and the curve is symmetric as to a centre C; but in the parabola the second pair (F', $D'R'$) along with C withdraw along the axis to ∞; all parallels to the axis are diameters, central and focal chords (as will be seen) through C' and F'. Also, the common equations of the ellipse and hyperbola ($x^2/a^2\pm y^2/b^2=1$), on pushing the origin O from the centre C to the vertex V at the left of the curve, become $y^2=2b^2/a\cdot x\mp b^2/a^2\cdot x^2$. Here $2b^2/a$ is a finite length called *parameter,* a focal chord perpendicular to the axis; hence b^2/a^2 vanishes for $a=\infty$. When this parameter is conveniently written $4p$, the equation of the parabola referred to its axis and the vertical tangent as coordinate axes is

$$y^2=4px.$$

Focal and Other Properties.—For $y=2p$, $x=p$. Hence F is the point (p, 0). Also, since $e=1$, the directrix DR is the vertical $x=-p$. By the general law the tangent at $P(x', y')$ is

$$yy'=2p(x+x')$$

Hence for $y=0$, $x+x'=0$ or $x=-x'$; i.e., *the vertex O bisects the subtangent ST* (fig. 1). By exchanging the direction-coefficient

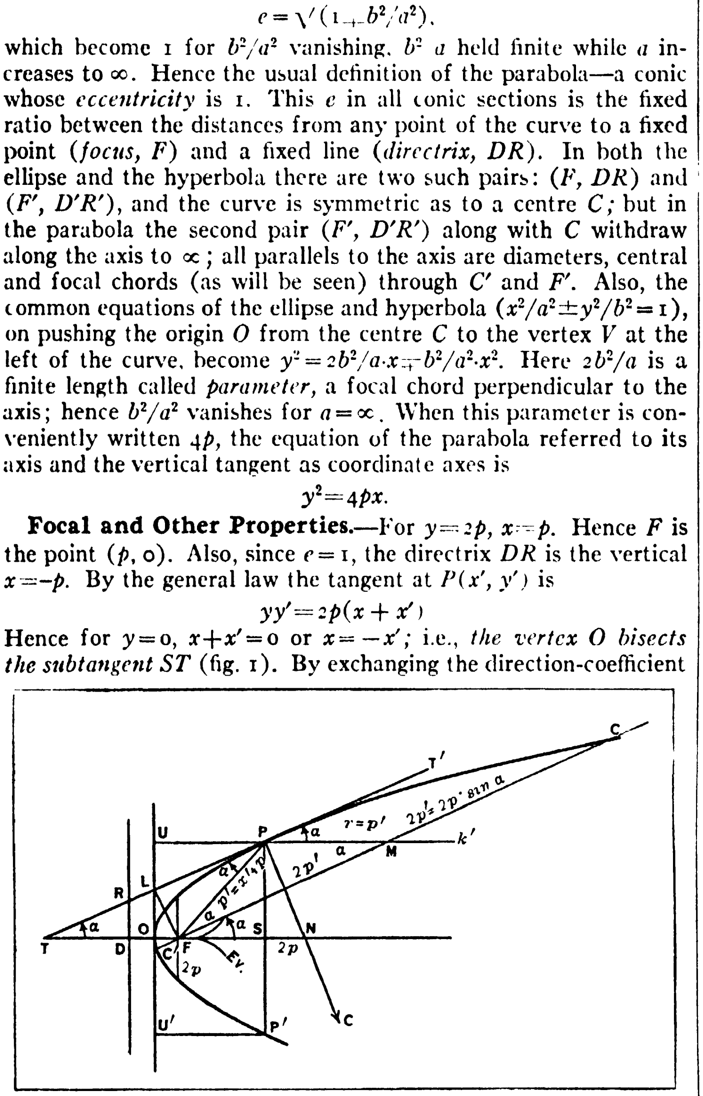

FIG. 1

$2p/y'$ for $-y'/2p$, the normal is found to be $2p(y-y')+y'(x-x')=0$. Whence for $y=0$, $x-x'=2p$ or $x=x'+2p$, i.e., *the subnormal SN=2p, a constant,* the half-parameter. Hence F (p, 0) bisects the hypotenuse TN of the right Δ TPN in the circle about F with radius $FP=x'+p$. Plainly also, both vertical tangent and focal perpendicular on any tangent bisect the tangent-length PT. The Δ TFP being isosceles, axis and focal ray (FP) are like-sloped to the tangent PT, which thus bisects the angle between the focal ray PF and the diameter PF' (the second focal ray, parallel to the axis, to the second focus F' at ∞). So also, in both the ellipse and the hyperbola, the tangent at P bisects the angle between the focal rays FP, $F'P$. Again, TFP being isosceles, the angle PFN (2α) is twice the angle PTN (α); so, too, for any other tangent (at Q) and focal ray FQ, the angles being β and 2β; hence the angle PFQ ($2\alpha-2\beta$) between the focal rays is twice that ($\alpha-\beta$) between the tangents. Now two opposite focal rays FC, FC', forming one focal chord CFC', diverge by 180°; hence tangents at the ends C, C' of the focal chord diverge by 90°, at a right-angle. They also meet on DR; for (since $\alpha=FTP=FLO$, $OL=p/\tan\alpha=p/m$) their equations are $y=mx+p/m$, $y=x/m-mp$; on subtracting, $(1+1/m)(x+p)=0$

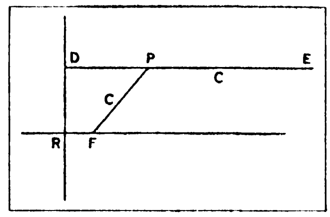

FIG. 2

or $x+p=0$, the directrix, the polar of the pole F. For $m=0$, or $\alpha=0$, the tangent becomes the line at ∞. Clearly, the normal $PN=\sqrt{(y^2+4p^2)}=2\sqrt{p(x+p)}=$ twice the geometric mean of FN and FO.

That the second focal ray PF' is really a diameter appears on transforming $y^2=4px$ to oblique axes PF' and PT; for the transformed equation readily reduces to $y^2=4p'x$. Hence to any value of x correspond two equal and opposite values of y, *i.e.*, the second focal ray PF' bisects all chords parallel to the tangent PT. The constant $4p'$ is easily shown to be the focal chord among these parallels, and $p'=x'+p=$ focal ray of the new origin $P(x',y')$.

By an improved method of exhaustion, suggesting modern integration, Archimedes (287–212 B.C.) proved the half-segment $OSP=\frac{2}{3}OSPU$; hence the whole segment $POP'=\frac{2}{3}PP'U'U$. So too for any oblique segment, since the form of the equation is the same and the areal elements parallel to the tangent are all sloped at the same angle (α) to the axis. Less simple, though readily proved, are such properties as that the circle circumscribing the triangle of any three tangents to the parabola passes through the focus F. More important, in the parabola as in all conics the radius (ρ) of curvature equals the cubed normal divided by the squared half-parameter; i.e., $PC=\rho=N^3/4p^2=(y^2+4p^2)^{\frac{3}{2}}/4p^2$, or $\rho : N=N^2 : 4p^2$. The locus of this centre of curvature C is the *semi-cubical* or *cuspidal parabola* $27py^2=4(x-2p)^3$, remarkable as the first curve rectified (by W. Neil, 1657, and H. Van Haureat, 1659), unless slightly antedated by the cycloid (fig. 1).

The parabola is perhaps best known as the path of a projectile through an unresisting medium under constant like-directed acceleration. However, air resists and the acceleration of gravity is neither quite constant nor fixed in direction; hence, especially in long high flights, the trajectory deviates much from a parabola, which is uniform (since $e=1$), the curves differing only in size, with F the centre of similitude for coaxial confocals. The parabola appears in many other physical problems and connections.

Construction and Analysis.—The curve may be drawn by fastening an inextensible cord C at a fixed point F and at one end E of a rigid ruler $ED=C$, sliding at right angles along a fixed line DR. A pencil P, holding the cord taut against ED, traces a parabola (fig. 2). To find points of a parabola, given the focus F and the directrix DR, draw the axis through F upright on DR at D, and bisect FD; this determines the vertex O, and $OF=p$. About F as centre draw any circle cutting the axis at T and N; from N lay off (toward F) $NS=2p$ and through S draw a circle-chord PP' upright on the axis; then P and P' are points of P.

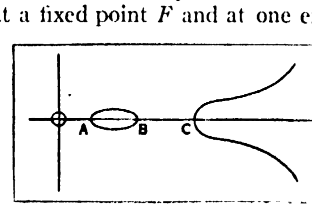

FIG. 3

To find F and DR of a parabola, draw two mutually perpendicular pairs of parallel chords, and also the bisectors (or diameters) of the pairs meeting the parabola at P and Q. Draw the tangents at P and Q (parallel to the bisected chords); being at right angles, they meet on the directrix, as at R; draw DR perpendicular to the diameters. Through P and Q draw chords

sloped to the tangents as the tangents are to the diameters; these chords meet in the focus F, the diameter through F is the axis, the segment FD is $2p$, its mid-point O is the vertex.

The name parabola is applied loosely to many other curves, especially of the equational form $y^{m+n}=a^m x^n$, besides the Apollonian or quadratic $y^2=4px$ For example, the cubic $y^3=a^2x$, the biquadratic $y^4=a^3x$, the semicubic parabola $y^3=ax^2$, all having been subjects of early study (Descartes, Newton, *et al.*)

There is also the cubic parabola $xy=ax^3+bx^2+cx+d$, called the *cartesian parabola* from its use by Descartes to solve sextic equations by its intersections with a circle. There are also the

divergent parabolas, $my^2=(x-a)\ (x-b)\ (x-c)$,

which vary widely with varying $a<b<c$. For all three real, with $+m$, the curve is an oval (shrinking to a conjugate point for $a=b$), followed after an interval ($b<x<c$) by a parabola-like branch (fig. 3). The two parts look little alike, yet depict the same law of algebraic form; also, during the interval the geometric law of form loses all real content—the curve-points are imaginary, the geometric depiction vanishes, to reappear for $x=c$—which may have philosophic significance

See T. H Eagles, *Plane Curves* (1885) (W. B. SM)

PARABOLOID, in geometry, a non-centric open surface of the second degree. Its vertical axial equation is either

$$x^2/a+y^2/b=4z, \quad \text{or} \quad x^2/a-y^2/=4z$$

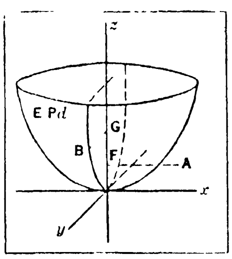

FIG 1

The first form, the elliptic paraboloid, meets the X-Z and Y-Z planes in the parabolas $x^2=4az$ and $y^2=4bz$ respectively, and is traced by an ellipse moving parallel to XY, its centre on Z, its vertices on these two parabolas, with parameters $4a$, $4b$ For $a=b$, this elliptic paraboloid becomes the "revolute," $x^2+y^2=4az$, of $y^2=4az$ round Z; conversely, on shortening all its y's in the ratio b/a, the "revolute" becomes the elliptic paraboloid (fig 1). A plane parallel to XY cuts the surface in the moving ellipse $ay^2+bx^2=4abz$; on turning this plane round the major axis of the ellipse through the angle θ, the minor axis grows indefinitely; at some angle θ ($\cos\theta=\sqrt{b/a}$) it equals the major axis, and the ellipse becomes a circle. Parallel planes make similar sections; clearly there are two such plane-directions, two sets of circles and two *cyclic points* of tangency The right lines lying on the surface are unreal

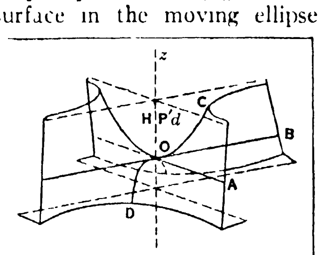

FIG 2

The second paraboloid is *hyperbolic* [$x^2/a-y^2/b=4z$] Clearly XY cuts it in the pair of lines $bx^2-ay^2=0$; all parallel cuts are hyperbolas or an hyperbola and its conjugate according as z is positive or negative Sections made by YZ and ZX are the parabolas (fig. 2), $y^2=-4bz$ and $x^2=4az$ *respectively*. The paraboloid is the path of an hyperbola always parallel to XY, moving with its vertices on one of these parabolas, and with its asymptotes always parallel to $bx^2-ay^2=0$ At XY the moving hyperbola passes through this asymptote-form over into the conjugate hyperbola, its vertices passing over from one parabola on to the other. At any stage $+z$ and $-z$ yield an hyperbola and its conjugate, respectively. The surface is saddle-like, $4a$ and $4b$ are the parameters. O is the vertex, Z is the axis, and its cyclic planes and points are unreal. However, similarly to the simple hyperboloid (*q v.*), it contains two systems of real right lines, each line of each system cutting all lines of the other system, but none of its own (fig 3) Each such pair of intersectors fixes a tangent-plane cutting the surface, which is not developable, but is *skew* or a *scroll*. (*See* MATHEMATICAL MODELS.)

(W. B SM)

PARACELSUS, THEOPHRASTUS BOMBAST VON HOHENHEIM (*c.* 1490–1541), great German physician, born near Einsiedeln in the canton Schwyz. His father was also a physician and his mother was, before her marriage, superintendent of the hospital at Einsiedeln. The son's epithet, Paracelsus, was probably his own invention, and was meant to denote his superiority to Celsus

Paracelsus, for a short time, studied at the University of Basel and then with Trithemius, abbot of Sponheim, under whom he prosecuted chemical researches, but he soon departed to the mines in Tirol where he became absorbed in the mechanical difficulties of mining, in the nature of minerals and in the diseases of miners.

On his return to Basel in 1526, Paracelsus became town physician and lecturer on medicine at the university The lectures, in German and not Latin, were preceded by a solemn burning of the works of Galen and Avicenna; they discredited past and contemporary medicine and set forth the lecturer's own theories and methods of treating disease Gradually, however, the novelty of the doctrines of Paracelsus began to wear off, and his bombastic and quarrelsome nature became more intolerable. His opponents reacted by pointing out both that he possessed no degree and that there were serious defects in his system Finally things came to a crisis through a dispute about fees with Canon Cornelius von Lichtenfels. In 1529, Paracelsus resumed his wanderings, practising in succession at Colmar, Nuremberg, Appenzell, Zurich, Pfaffers, Augsburg, Villach, Meran, Middelheim and other places. At last in 1541, Archbishop Ernst invited him to settle at Salzburg under his protection There after a few months of rest, he died on Sept 24 The cause of his death, like most other details in his history, is uncertain His enemies asserted that he died in consequence of a drunken debauch, but others maintain that he was thrown down a steep incline by emissaries of jealous physicians and apothecaries He was buried in the churchyard of St Sebastian. In 1752 a monument was erected to his memory.

In his works written during his wanderings, Paracelsus shows a genuine desire to promote the progress of medicine, but his powers were not adequate for his desires Indeed, it has been said that it is questionable whether he introduced a single new truth into medicine He advocates a simplicity in practice, but his prescriptions are extremely complicated; he exalts observation and experience, but he rejects dissection and all operations other than lithotomy, and, at the same time, introduces a number of new theories Fundamentally, his system is based on a visionary Neo-Platonic philosophy in which the life of man is regarded as inseparable from that of the universe. For him, the scriptural "limus terrae" from which the body of man is created is in reality an extract of all beings previously created. It is primarily a compound of "salt," "sulphur" and "mercury," the separation of these mystic elements in man being the cause of sickness The separation is due to the failure of the Archaeus, an occult vital force which is situated in the stomach, to perform its function of separating the useful from the poisonous. For the treatment of disease, Paracelsus introduced mineral baths, made opium, mercury, lead, sulphur, iron, arsenic, copper sulphate a part of the pharmacopoeia, and popularized tinctures and alcoholic extracts Since man contains all elements and requires them for the curing of his diseases, the physician must know the physical sciences and alchemy; he must also know astronomy, for not only do the stars influence disease, but man, like all terrestrial beings, is penetrated by the astral spirit. Thirdly, the physician must know theology, since, in addition to body and spirit, man has a third factor, the soul, which was created by God, and to which the spirit serves as a kind of body With Paracelsus' lofty views of the true scope of medicine it is impossible to reconcile his ignorance, his superstition and his erroneous observations

BIBLIOGRAPHY —The first book by Paracelsus, *Practica D Theophrasti Paracelsi, gemacht auf Europen*, was printed at Augsburg in 1529. The first and best collected edition, which probably

includes many non-genuine writings, was made by John Huser and printed at Basel in 1589–91. The first collected Latin edition (the works were originally composed in Swiss-German) was produced in 1603 by Palthenius, but the best Latin edition is that edited by Bitiskius in 1658. Some of the works, including the *Chirurgia magna,* were translated into French, English, and other languages during the 17th century. *See* Hartmann, *Life of Paracelsus* (1887); Schubert und Sudhoff, *Paracelsus-Forschungen* (Frankfurt a.M. 1887); Sudhoff, *Kersuch einer Kritik der Echtheit der paracelsischen Schriften* (Berlin, 1894); Waite, *The Hermetic and Alchemical Writings of Paracelsus* (1894); J. K. Proksch, *Paracelsus als medizinischer Schriftsteller* (Vienna, 1911); A. M. Stoddart, *The Life of Paracelsus* (1915); and J. M. Stillman, *Theophrastus Bombast von Hohenheim* (Chicago, 1920). *See* MEDICINE.

PARACHOR, a term introduced by S. Sugden (*J. Chem. Soc.,* 1924) to denote the value of the function $M\gamma^{\frac{1}{4}}/(D-d)$, where M is the molecular weight of a specified liquid, γ is its surface tension at a particular temperature, D is its density, and d is the density of its vapour. Since the molecular volume is M/D, the parachor is the molecular volume corrected (to some extent empirically) for surface-tension effects, and hence the name (Gr. *παρά,* by the side of; *χώρα,* space). Sugden and his collaborators have made many interesting applications of this function to the determination of chemical constitution, since the parachor is an additive function of atomic and structural constants and is nearly independent of temperature. (*See* CHEMISTRY, *Physical.*)

PARACHUTE, an instrument more or less resembling a large umbrella, which by the resistance it offers to the air enables a person or an object attached to it to descend safely from a balloon or flying machine in the air. In 1783 Sébastien Lenormand practically demonstrated the efficiency of a parachute by descending from the tower of Montpellier observatory; but he merely regarded it as a useful means whereby to escape from fire. To J. P. Blanchard (1753–1809) is due the idea of using it as an adjunct to the balloon. As early as 1785 he had constructed a parachute to which was attached a basket. In this he placed a dog, which descended safely to the ground when the parachute was released from a balloon at a considerable elevation. It is stated that he descended himself from a balloon in a parachute in 1793; but, owing to some defect in its construction he fell too rapidly, and broke his leg.

The First Parachute Descent from a Balloon.—André Jacques Garnerin (1769–1823) was the first person who successfully descended from a balloon in a parachute, and he repeated this experiment so often that he may be said to have first demonstrated the practicability of using the machine. His first public experiment was made on Oct. 22, 1797. He ascended from the park of Monceau, at Paris, and at the height of 2,236 feet he released the parachute, which was attached to the balloon in place of a car; the balloon, relieved suddenly of so great a weight rose very rapidly till it burst, while the parachute descended very fast, making violent oscillations all the way. Garnerin, however, reached the earth in safety. He repeated his parachute experiment in England on Sept. 21, 1802. The parachute was dome-shaped, and bore a resemblance to a large umbrella. The case or dome was made of white canvas, and was 23 ft. in diameter. At the top was a truck or round piece of wood 10 in. in diameter, with a hole in its centre, fastened to the canvas by 32 short pieces of tape. The parachute was suspended from a hoop attached to the netting of the balloon, and below it was placed a cylindrical basket, 4 ft. high and $2\frac{1}{4}$ ft. in diameter, which contained the aeronaut. The ascent took place at about six o'clock from North Audley street, London; and at a height of about (it is believed) 8,000 ft. Garnerin separated the parachute from the balloon. He was hurt a little by the violence with which the basket containing him struck the earth; but a few cuts and a slight nausea represented all the ill effects of his fall. A few years later, Jordaki Kuparento, a Polish aeronaut, made real use of a parachute. He ascended from Warsaw on July 24, 1808, in a fire-balloon, which, at a considerable elevation, took fire, but he was able to effect his descent in safety by means of his parachute.

FIG. 1.—A PARACHUTE HARNESS AND PACK READY FOR SERVICE

The next experiment made with a parachute resulted in the death of Robert Cocking. The great defect of Garnerin's umbrella-shaped parachute had been its violent oscillation during descent, and Cocking considered that if the parachute were made of a conical form (vertex downwards) the whole of this oscillation would be avoided; and if it were made of sufficient size there would be resistance sufficient to check too rapid a descent. He therefore constructed a parachute on this principle, the radius of which at its widest part was about 17 feet. On July 24, 1837, Cocking rose in the Nassau balloon from Vauxhall Gardens, London, hoping to reach a height of 8,000 ft.; but when the balloon reached 5,000 ft. it was found to be impossible to ascend to the requisite height if the parachute was to descend in daylight. Cocking accordingly let slip the catch which was to liberate him from the balloon. The parachute for a few seconds descended very rapidly, but still evenly, until suddenly the upper rim seemed to give way and the whole apparatus collapsed (taking a form resembling an umbrella turned inside out, and nearly closed), and the machine descended with great rapidity, oscillating very much. When about 200 or 300 ft. from the ground the basket became disengaged from the remnant of the parachute, and Cocking was found in a field at Lee, dashed to pieces.

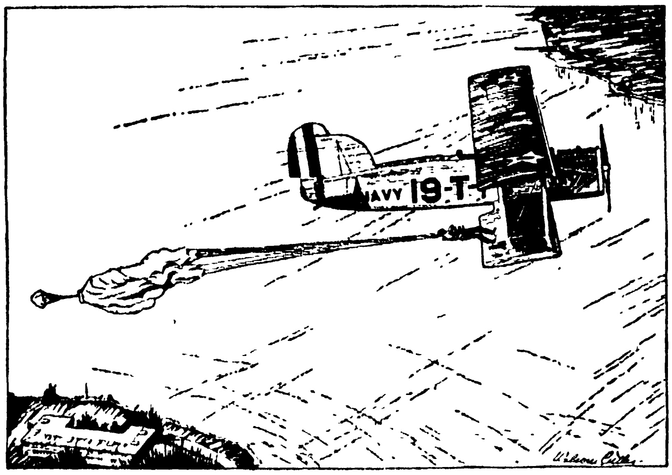
FIG. 2.—TRAINING PARACHUTE
Showing the way it is worn in an aeroplane

Many objections were made to the form of Cocking's parachute; but there is little doubt that had it been constructed of sufficient strength, and perhaps of somewhat larger size, it would have answered its purpose. John Wise (1808–79), the American aeronaut, made some experiments on parachutes of both forms (Garnerin's and Cocking's), and found that the latter always were much more steady, descending generally in a spiral curve.

The Modern Parachute.—In modern aviation, parachutes are recognized as a part of the standard flying equipment for use with aeroplanes. In 1912 Capt. Berry made the first descent from an aeroplane at St. Louis, Mo. He used a medium sized parachute, folded and stuffed into a conical cylinder tied under the front end of the aeroplane skid. During the last days of the World War in 1918, German aviators frequently used them; but after the war little was done to complete the use of parachutes until about the year 1921. At this time British and American aviators began working upon a parachute that could be carried conveniently by a pilot. It was obvious that the old style balloon parachutes were too cumbersome to carry in aeroplanes.

The Seat Pack and Lap Pack.—In 1918 the U.S. Army Air Service experimented with a "seat pack" type of parachute and in 1919 the type was generally recognized as standard and extremely efficient. More than 1,500 experimental jumps were made in achieving perfection. The "seat pack" is used as a seat cushion, thus removing all weight and bulk from the person of the aviator, and is the type in most general use for pilots. The "lap pack" has been developed for the use of machine gunners and photographers, or where it is not desirable to use a "seat pack." It will be readily understood that an aerial machine gunner usually has the most room directly in front of him and below the waist line. There is also the pack which is strapped on the back and which is used for special cases.

The standard seat pack aeroplane parachute is folded into a compact pack about the size of an ordinary chair cushion, but about twice as thick. It is worn strapped upon the body with the pack in place beneath the buttock of the wearer and it becomes the cushion when the aviator takes his seat in an aeroplane. Thus, the regular cushion in aeroplane cockpits is generally omitted. The equipment weighs approximately 18 lb. The sail of the parachute is made of carefully chosen untreated silk, because untreated silk does not become creased so easily as the finished material. When spread open, the parachute is 22, 24 or 28 ft. in diameter, 24 ft. being standard. The shroud lines are made from high-grade thrown silk and consist of not less than 32 threads of three-ply, each with a breaking strength of not less than 400 pounds. The main parachute is pulled from its case by a smaller "pilot chute," about 3 ft. in diameter, which operates by spring when the aviator pulls the "rip cord" that holds the pack closed. When open the parachute descends at the rate of 16 to 24 ft. per second, depending upon the weight of the wearer and density of the air. Each parachute is tested by an actual drop from an aircraft using a dummy or weight.



BY COURTESY OF THE UNITED STATES NAVY

FIG. 3.—THE "LIFT OFF" JUMP WITH A PARACHUTE FROM AN AEROPLANE

The lowest height at which a parachute will open is probably not less than 150 ft., although a few forced jumps have been made at slightly lower altitudes. The lowest altitude considered safe is 250 ft., although the higher the jumper is, the better are his chances, because sometimes delayed openings occur. Jumps have been made from aeroplanes as high as 25,000 ft.

Use of Parachute.—There are two general ways to leave an aircraft with a free-type manually-operated parachute; one is by the "lift off" method, and the other by the "free fall" method. In making a lift off jump, the jumper gets on one of the wings where there are no projections or obstructions of any kind directly behind, and pulls the rip cord, which opens the parachute and pulls the jumper from the aircraft. In case of jumps made for training purposes, this method eliminates unnecessary hazards and gives the student a better chance to become familiar with parachute operation. In making a free fall, the jumper clears the aircraft at any point, free of obstruction, that is convenient to him. After falling clear, a jerk on the rip cord releases the parachute. Where there is plenty of altitude, a long "free fall" is not dangerous. Actual jumps have disproven the theory that a man falling free through space becomes confused and forgets to pull the rip cord. Several cases are on record where men have fallen 3,000 to 4,000 ft. without pulling the rip cord and yet retained perfect control of their senses. When the parachute is opened and descending at its normal rate, the jumper's position in the harness is as though he were sitting in a swing. The rate of descent is between 16 and 24 ft. per second depending on the weight of the wearer, the size of the parachute and the density of the air. The impact on landing at these speeds is equivalent to that obtained from a free jump from heights of 4 to 9 ft. respectively. In the descent any tendency to oscillate should be checked as soon as possible. This can be done by pulling down vigorously on the shroud lines on the high side of the parachute as the body swings in that direction. The instant the body starts on the return swing, the shroud lines should be released and the swing met by pulling down on the opposite shroud lines. At the same time the jumper should try to face the line of flight, as a much better and safer landing can be effected in that position. This can be done by grasping a handfull of shroud lines, and giving a vigorous swing on them, not down, but as much in a circle as possible. This tends to "spin" the parachute around. During descent, if it is seen that there is danger of striking some building or other obstructions, it is possible to change the gliding angle by pulling down on the shroud lines. This tends to spill air from under the parachute on the higher side, and results in an appreciable angle of glide toward the lower side. This should never be attempted when near the ground, except in an emergency, as it results in an increased rate of descent.

If it should be seen that the parachute is going to "under shoot" the place where it is desired to make the landing—that is, the parachute in its normal flight is gliding toward a desired landing place, but its rate of descent is such that it evidently will reach the ground before this spot is reached—nothing can be gained by trying to "side slip" in this direction for the parachute will travel further in a horizontal direction if it is kept stable. Upon nearing the ground the best method of relieving the shock of impact is to grasp the harness webbing over the head, retaining the sitting position in the harness—but with the knees slightly lower than the hips, with feet together and lifted slightly up and forward—relaxing the muscles as in jumping off a low platform. The body should be lifted up into the harness by pulling on the harness webbing just before the moment of striking. If the parachute has a tendency to "fill out" and drag the body along the ground on landing, it can be collapsed by pulling the top shroud lines toward the body, which tends to straighten the parachute out in the form of a sheet. Pulling on the lower shroud lines will have a tendency to keep the parachute "filled out." In case it is seen that a landing is going to be made in a body of water, it is best to settle well back into the harness and unsnap the leg straps; when close to water (about 12 ft) unsnap the breast snap; and when 4 or 5 ft. from the water, drop out of the harness.

FIG. 4.—A LANDED JUMPER ABOUT TO SPILL THE AIR FROM THE LOBE OF HIS PARACHUTE

Parachute Flare.—A parachute flare contains illuminating chemicals attached to a small parachute, which, when ignited and dropped from an aircraft, will descend slowly and light up the countryside for many miles. Parachute flares are used for military purposes to discover night movements of enemy troops by aerial observers; by aviators to locate landing fields at night, guide the approach to the earth and to take night photographs.

PARADISE. A Persian word, meaning a royal park or enclosed pleasure garden, found in three late passages of the Hebrew Old Testament, Neh. ii. 8, Cant. iv. 13, Eccles. ii. 5, in much

the same sense. The Greek Old Testament uses it much more freely, especially as a name for the Garden of Eden in Genesis, and in other passages where the Hebrew has "garden of God" or simply "garden." The name has thus passed into use as the title of the happy garden in which our first parents lived. Other forms of the myth may be traced in the Old Testament. Behind the dirge of Ezekiel on the king of Tyre (Ezek. xxviii.) lies a myth which pictures the primeval man as dwelling in the garden of God, situate not in a desert plain but on the mountain of God. He wears glorious apparel, studded with gems. He is originally blameless, but sins, and is banished from the mountain, which, like the garden in Genesis, is the dwelling-place of God. These myths are not of Hebrew origin, but belong to the common stock of Semitic tradition.

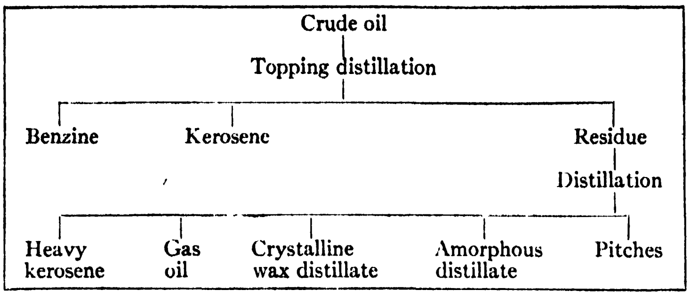
Among the Sumerians there were myths about the Paradise in which man had lived before the Flood, and his loss of this primitive bliss. While certain features of the Babylonian myths are found in the Hebrew stories no close parallel to the latter has yet been discovered in cuneiform, and it is unlikely that they were borrowed directly from Babylon. Many peoples had myths telling of a golden age when men dwelt happily with the gods in some fair isle or happy garden: sometimes this Paradise was thought still to exist. If only the way to it might be re-discovered! So Gilgamesh, the hero of the Babylonian epic, travelled a perilous journey to the island where Utnapishtim, the Babylonian Noah, dwelt with the gods; there he indeed obtained the plant which conferred immortal life, but a serpent stole it from him as he returned. But though man might not in this life find the road to Paradise might not the dead return there? The Semites generally, and the Hebrews in particular, thought of the dead as maintaining a shadowy existence in a gloomy cavern of the underworld. When, however, the hope of a Messianic kingdom upon earth dawned there was developed also the idea that the righteous dead might be raised to share its bliss. It is noteworthy that the Messianic kingdom renews on earth some of the felicities of the Garden of Eden: the land becomes miraculously fertile, even the desert blossoming as the rose, and the beasts live in idyllic amity. The conception is developed by the Jewish apocalyptic writers, especially the author of *Enoch,* who wrote in the early second century B.C.

Later this Paradise of hope becomes more supernatural, and is situated not on earth but in heaven. The book of *Enoch* (*q.v.*) divides the underworld into four parts, tenanted severally by the wicked, the moderately wicked, the moderately good, and the supremely good; the good even there enjoy some measure of felicity ere they are raised to share the happiness of the Messianic kingdom. Paul gives the name Paradise to the third of the seven heavens recognized by the Rabbinic schools. In Rev. ii. 7 Paradise would seem to be the final state of bliss attained by the saints. The visions of the New Jerusalem coming down out of heaven to the earth (Rev. xxi., xxii.) recall in several features the Paradise from which the earliest man was driven: in it are miraculous trees, giving food and healing; through it flows the river of water of life; and there, free from sorrow, pain and death, dwell the saints in the presence of God.

See EDEN, and particularly the articles *Blest, Abode of the* in the *Encyclopaedia of Religion and Ethics.* (W. L. W.)

PARAFFIN, the term given to a mineral wax and also used as a generic name for a particular series of hydrocarbons. Refined commercial paraffin is a white, translucent, waxy solid devoid of taste and smell and characterized by chemical indifference. The industry owes its origin to Dr. James Young, who in 1850 applied for his patent "to obtain . . . paraffin from bituminous shales" by slow distillation. To-day, paraffin is obtained from the many crude petroleums that are designated "paraffin-base oils" because of their wax content. The wax-bearing crudes of America contain on the average less than 5%, those of Galicia about 6%, the oils of Burma 10% and Scottish shale oil about 13% of merchantable wax.

Manufacture.—The manufacture of paraffin by modern methods falls under two heads. Firstly the distillation of the crude oil and secondly the extraction of wax from the distillate. A process that has become almost conventional starts with crude oil and brings about by continuous distillation the removal of petrol and kerosene, leaving what may be called a "topped" oil.



In the majority of cases this topped oil contains heavy oil, such as gas oil, that is used for enriching water-gas in the gasworks, lubricating oils, wax and pitch, as is clearly shown in the above diagram. This residue oil is again distilled continuously and run down to heavy kerosene, gas oil, wax distillates and pitch. In more recent practice the distillation is carried out in a pipe-still through which the oil passes at high velocity under pressure and is discharged as vapour into a fractionating column. From the top of the column may be easily obtained an overhead distillate, *e.g.,* petrol, and at various "decks" or trays at different distances from the top may be withdrawn fractions of higher and higher boiling point. But, in the majority of cases the wax distillates are of two kinds, known as crystalline or pressable and amorphous or non-pressable. As will be seen later, this difference is probably a function of the crystal size.

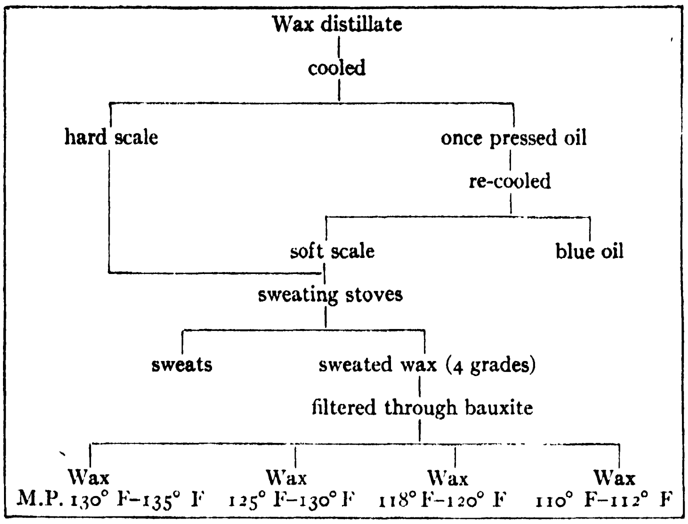
Crystalline (or Pressable) Wax Distillate.—This material in effect is a mixture of crude lubricating oils and crystalline paraffin hydrocarbons that possess no lubricating power whatever. It is necessary to remove the wax firstly because of this lack of ability for lubrication and secondly because the high melting point of wax would render the lubricating oils solid or semi-solid at ordinary temperatures, and thirdly because of the market value of the wax. This wax distillate, then, is passed on to the paraffin sheds, as the extraction plant is usually termed, and is allowed to repose in tanks to promote thorough settling and the maximum reduction in temperature. It is then transferred to plant in which it can be cooled artificially to any particular temperature required. The refrigerating plants that achieve this cooling usually depend for their effect on the expansion of liquid ammonia or liquid carbonic acid gas. In modern practice heat exchangers are used so that the cold filtrate from the filter-presses can be employed further to chill the incoming wax distillate to the refrigerators. It is frequently convenient to cool the wax distillate in two stages, but this procedure depends largely on the content of wax and its nature. There have been devised many types of cooling apparatus of which that patented by James Bryson of Scottish Oils Ltd., is typical. This type consists of an inner cylinder in which the wax distillate passes and which is provided with a scraper. The cylinder is surrounded by a concentric casing through which cold brine is circulated after having been chilled by contact with pipes in which the refrigerant is being evaporated. The plant designed by A. C. Thompson uses direct cooling in preference to brine cooling and the oil is pumped over the vessel that contains the expanding ammonia or other cooling agent.

A more recent type is the Allen-Moore, in which the oil to be cooled passes into thin cells provided with scrapers and cooled by contact with the refrigerant. Broadly speaking it is advisable to cool the wax distillate slowly. In this way large crystals are produced from which the adherent oil easily drains.

The frozen mass containing the crystallized paraffin is now pumped through filter-presses under high pressure, *e.g.,* 500 lb. per sq.in. The filter-presses are kept in sheds which are well insulated from outside conditions and chilled to the necessary temperature by radiators in which cooled brine is circulated. When the filter-press is fully charged with wax, it is opened and the contents are discharged into a trough situated below the press and conveyed by a screw conveyor into the refining section. If a

second cooling is necessary, the expressed oil, commonly called the "blue oil," is re-cooled to a lower temperature in similar plant and filter-pressed again.

Example of Treatment of Wax Distillate



A modern filter-press consists of a series of thin circular steel plates fitted with steel gauze on each side and provided with a circular opening in the centre to permit oil to be fed into each chamber. Heavy canvas is cut to fit the plates and is either sewn or firmly clamped round the hole in the centre. Spacing rings are placed between each pair of plates, thereby forming chambers in which the wax cakes form. The series of plates and rings are assembled on the press frame and the whole closed under a pressure of about 700 lb. per sq.in. by means of a hydraulic ram. This type is built to hold up to 400 or 500 plates 48 in. in diam. and to work up to 500 lb. pressure. The spacing rings used to form the chambers vary in thickness from ⅜ in. to 1 in., enabling the thickness of the wax scale cakes to be altered according to the quality of the oil being pressed. For instance, should the oil contain an easily pressable crystalline wax scale a thick cake would be desired in order to work the press at its maximum capacity by reducing the number of plates in use, but should the oil contain a soft wax it might be advantageous to reduce the thickness of the cake.

Pressing.—The oil is pumped by means of low-pressure pumps through the chillers into a tank kept at the exact temperature required and thence by means of a high-pressure pump into the main line feeding the presses, any oil over the amount taken by the presses being returned to the tank through a relief valve set at the maximum pressure required. This allows perfect control to be exercised over the temperature and pressure of the oil.

The paraffin distillate from the stills, usually having a settling point of from 70° F to 80° F, and a recoverable wax content ranging between 5% and 10%, is chilled to the temperature which will give a pressed oil having the desired set point and then fed into the presses. The oil is let into the presses very gently and when the pressure starts to rise the rate of increase is kept slow and constant. When the pressure has reached its maximum the press is allowed to remain under pressure until it is required to be emptied ready for a new charge and this permits the wax scale to become as free from oil as possible.

The Refining of the Crude Paraffin.—The original wax distillate is now separated into blue oil and crude scale; the latter still contains a little adherent oil and this must be removed and the crude wax chemically treated to remove colouring matter and odorous impurities.

The process that follows achieves the removal of low melting waxes and adherent oil and is called the "sweating process," first developed by Price's Candle Company. There are innumerable modifications of the sweating process, which may be regarded as a fractional melting operation, and perhaps the simplest to understand is that devised by N. Henderson. In this there is a frame on which are set nine shallow trays one above the other. In each tray wire gauze is stretched 2 in. from the bottom. The frames can be set in rooms or stoves provided with heating and cooling arrangements. The trays are first set level and water is run in to the depth of the gauze. Then the melted wax is run on to the water surface and is allowed to solidify. After solidification the trays are tilted and the water run off. The temperature inside the stove is gradually raised and fractional melting goes on until the material on the gauze is of the correct melting point. The "sweats" are run off and may be again put through the process. After drawing off the sweats the temperature is still further raised and the sweated wax is melted and run to the next stage of the process.

The oil and soft wax that sweats out during the process are divided into fractions, graded according to their setting points.

The first runnings from the trays up to a set point of about 90° F, termed "light foots oil," is in the ordinary process used as works fuel; it has no other commercial value and the wax it contains is of too low a melting point to justify repressing or further redistillation.

The next fraction sweating out, from a set point of 90° to 110° F, termed "heavy foots oil," is generally pumped back for incorporation with the wax distillate cut from the crude oil.

Wax that sweats out above this point till the end of the operations is reached is re-sweated to give a wax of a lower grade, or if only one grade of finished wax is being made it is mixed with the scale from the filter-presses to make up the next sweating chamber charge.

The setting points and fractions obtained are, of course, purely arbitrary and are governed by the number of the grades of finished wax being made, as well as by the method and temperatures used in processing the wax. It still contains colouring matter and therefore must be decolorized.

The Finishing Treatment.—In many refineries the wax is melted and run into agitators, where it is treated with successive amounts of strong sulphuric acid. The agitators are lead-lined and steam-jacketed and the mixture of acid and wax is violently stirred up by air agitation. The agitation is carried on for 30 min., and then an hour is allowed for settling. At the end of this time the acid sludge is drawn off and the melted wax is run into another agitator, in which it is washed with hot water and then with caustic soda and finally with a hot water spray. After removing all traces of water by long settling, the wax is dried finally by blowing air through it. Alternatively the use of caustic soda may be dispensed with by following up the acid treatment with agitation in the presence of finely divided absorbent clay. Even at this stage the wax is not entirely colourless and odourless and it is necessary to filter it through ignited fuller's earth.

Another method of treatment that has been found very effective and that dispenses with the acid treatment altogether is achieved by filtering the wax-scale through recently ignited bauxite. This mineral is essentially a mixture of alumina and ferric oxide and has a very porous structure. To prepare it for use, the crude rock is ground and sieved to form coarse particles that pass through a 10-mesh sieve and are retained on a 90-mesh sieve. The bauxite is then passed through a furnace at about 600° C, where it is ignited and becomes substantially free from water. The bauxite is now put into filters that are jacketed and the melted wax is allowed to flow through, samples being tested to see that the colour of the effluent wax is up to standard. The wax is run to trays, allowed to solidify, and packed in bags; each cake of wax is about 12 in.×18 in.×1½ in. in dimensions and weighs about 10½ lb.

Refined wax is always passed through a filter-press equipped with double sheets of filter paper before final caking. The wax should be entirely odourless and a cake of wax freshly broken should possess no smell at the plane of fracture. It should be colourless, stable to heat and light, and of the correct melting point. It should be free from opaque blemishes ("mottling") and should not be crumbly or flaky. It is sold commercially in terms of melting point, *e.g.*, hard wax in the grade that melts between 130° F and 135° F.

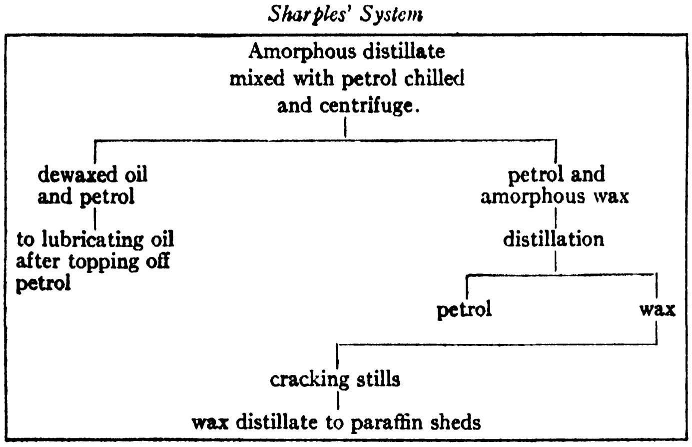
It has been found in the case of certain sulphurous oils that a preliminary treatment with alkaline hypochlorite before filtration materially assists in the production of a non-odorous wax.

Amorphous Wax—Non-pressable.—After the pressable wax has been distilled off from the crude oil residue there appears a fraction containing wax, the crystal size of which is very much smaller than that of the preceding fraction; this is the so-called *amorphous distillate*.

Until recent times fractions and residues of petroleum containing this material that could not be handled in filter-presses were allowed to stand, well diluted with petrol, in tanks at a low temperature and for a long period of time. The slow imperceptible action of gravity gradually precipitated the slightly heavier wax out of the slightly lighter solution. There was left at the bottom of the tank a soft salve-like mass and above it a petrol solution of de-waxed oil. In many cases the precipitate was so amorphous that it could be worked up for petroleum jelly and this was particularly the case when a residue was being treated.

A revolutionary idea has changed this procedure. It is to the credit of Sharples, who had successfully separated cream from milk by means of high speed centrifuges to apply this method to the separation of amorphous wax from its accompanying oil.

Sharples' System



Sharples' Process.—The amorphous distillate is diluted with approximately an equal bulk of petrol or a fraction of petrol from which the more volatile part has been distilled off. The mixture is now very slowly cooled till it reaches a temperature of about 10° F throughout a period of 20–30 hours. It is then conveyed into the bowl of a centrifuge rotating at 30,000 revolutions per minute when the slightly heavier wax is flung outward against the periphery whilst the slightly lighter solution occupies the middle of the bowl, by natural law. The centrifuge runs continuously and there are consequently ejected from spouts at the top, (a) amorphous wax that is melted by suitable heating means and (b) a petrol solution of de-waxed oil. These run away to separate tanks. The wax obtained after removing some of the solvent that is conveyed with it is in the micro-crystalline state and it is converted into macro-crystalline wax by a redistillation under cracking conditions, that is to say, by distilling at a relatively high temperature, thus permitting a re-adjustment of the molecules. The distillate from the amorphous wax contains oil and crystalline wax and may be put through the sheds along with the pressable wax distillate.

Uses of Paraffin.—Although paraffin wax may be regarded as a by-product of petroleum distillation, the world's supply is very considerable, amounting to approximately 200,000 tons a year. It finds its chief use in replacing and as a substitute for certain expensive natural waxes such as beeswax. It enters largely into the composition of floor polishes; it is used for filling leather and as an insulator in the electrical trades. A very large amount is also used for water-proofing paper and cardboard, and thus is an essential component of water-proof receptacles for packing; during the World War, for example, jam pots were made of stout paper rendered air-tight and water-proof by means of paraffin. In a similar way it may be applied for water-proofing fibres before weaving, and very large amounts of water-proofed textiles are now manufactured. The softer paraffins are used in the manufacture of ointments and salves, and a large amount is applied in rendering match sticks water-proof and flammable.

The above uses, however, are only minor when compared with the vast quantities used in the manufacture of tapers, candles and night lights. In making candles it is not usual to employ pure paraffin, because it has a tendency to stick to the moulds and, moreover, may soften too easily in service, so the paraffin is mixed with stearic acid and palmitic acid that are obtained by the decomposition of many natural fats. The effect of the stearic acid is to give a less plastic composition, one that is stiffer and not so likely to bend in warm weather.

The earlier candles were usually made of tallow, were very soft and the wick required constant snuffing, but in the modern wax candle the wick is so woven that it tends to bend over during burning and so be consumed in the hot edge of the flame as fast as the burning proceeds. (A. E. D.)

PARAFFIN, CHEMISTRY OF. Paraffin is the generic name given to the saturated hydrocarbons of the general formula C_nH_{2n+2}. Many of these hydrocarbons exist as naturally occurring products, the lower (gaseous) members of the series being met with as exhalations from decaying organic matter (marsh gas) or issuing from fissures in the earth, or in the gases from coal mines; the higher members occur in petroleum and ozokerite.

The principal members of the series are shown in the following table:—

Formula	Name	Melting point	Boiling point	Specific gravity
CH_4	Methane	−186°	−160°	0·415 at b.p.
C_2H_6	Ethane	−172°	−93°	0·446 at 0°
C_3H_8	Propane	..	−45°	0·536 at 0°
C_4H_{10}	Butane	..	+1°	0·600 at 0°
C_5H_{12}	Pentane	..	36·3°	0·627 at 14°
C_6H_{14}	Hexane	..	69°	0·658 at 20°
C_7H_{16}	Heptane	..	98°	0·683 at 20°
C_8H_{18}	Octane	..	125·8°	0·702 at 20°
C_9H_{20}	Nonane	−51°	150°	0·718 at 20°
$C_{10}H_{22}$	Decane	−31°	173°	0·730 at 20°
$C_{11}H_{24}$	Undecane	−26°	195°	0·774 at m.p.
$C_{12}H_{26}$	Dodecane	−12°	214°	0·773 at m.p.
$C_{14}H_{30}$	Tetradecane	+4°	252°	0·775 at m.p.
$C_{16}H_{34}$	Hexadecane	18°	287°	0·775 at m.p.
$C_{20}H_{42}$	Eicosane	37°	205°*	0·778 at m.p.
$C_{21}H_{44}$	Heneicosane	40°	215°*	0·778 at m.p.
$C_{23}H_{48}$	Tricosane	48°	234°*	0·779 at m.p.
$C_{31}H_{64}$	Hentriacontane	68°	302°*	0·781 at m.p.
$C_{35}H_{72}$	Pentatriacontane	75°	331°*	0·782 at m.p.
$C_{60}H_{122}$	Hexacontane	101°	..	..

*Under 15 mm. pressure.

The lowest members of the series are gases at ordinary temperature; those of carbon content C_5 to C_{15} are colourless liquids, and the higher members from C_{16} onwards are crystalline solids. The highest members only volatilize without decomposition when distilled under diminished pressure. They are not soluble in water, although the lower and middle members of the series are readily soluble in alcohol and ether; the solubility, however, decreases with increase of molecular weight, so that the highest members of the series are almost insoluble in these solvents. The specific gravity increases with the molecular weight but always remains below that of water. The liquid paraffins have a characteristic smell, more pronounced in the case of the branched chain members. The paraffin may be synthesized by reducing the alkyl halides (preferably the iodides) with nascent hydrogen, using either sodium amalgam, zinc and hydrochloric acid, concentrated hydriodic acid (Berthelot, Jour. prak. Chem. 1868, 104, p. 103), aluminium amalgam (H. Wislicenus, *ibid.*, 1896 [2], 54) or the zinc-copper couple (J. H. Gladstone and A. Tribe, Ber., 1873, 6, p. 202 *seq.*) as reducing agents.

They may also be derived from alkyl halides by heating to 120–140° C with aluminium chloride in the proportion of three molecules of alkyl halide to one molecule of aluminium chloride (B. Kohn, Ber., 1883, 16, p. 560); by heating with zinc and water

to 150–160° C. (E. Frankland, Ann., 1849, 71, p. 203; 1850, 74 p. 41), $2RI+2Zn+2H_2O=2RH+ZnI_2+Zn(OH)_2$; by conversion into zinc alkyls, which are then decomposed by water, $ZnR_2+2H_2O=2RH+Zn(OH)_2$; by conversion into the Grignard reagent with metallic magnesium and decomposition of this either by water, dilute acids or preferably ammonium chloride (J. Houben, Ber., 1905, 38, p. 3019), $RMgI+H_2O=RH+MgI(OH)$; by the action of potassium hydride (H. Moissan, Comptes rendus, 1902, 134, p. 389) and by the action of sodium in absolute ether solution (A. Wurtz, Ann. chim. phys., 1855 [3], 44, p. 275), $2RI+2Na=R{\cdot}R+2NaI$. They may also be obtained by the reduction of the higher fatty acids with hydriodic acid (F Krafft, Ber., 1882, 15, pp. 1687–1711),

$$C_nH_{2n}O_2+6HI=C_nH_{2n+2}+2H_2O+3I_2;$$

by the reaction of unsaturated hydrocarbons with hydrogen in the presence of a "catalyst" such, for example, as reduced nickel, copper, iron or cobalt (P. Sabatier and J B. Senderens, Ann chim. phys., 1905 [8], 4, pp. 310, 433); by the elimination of carbon dioxide from the fatty acids on heating their salts with soda-lime or baryta, $CH_3SO_2Na+NaOH=CH_4+Na_2CO_3$, or by heating their barium salts with sodium methylate in vacua (I. Mai, Ber., 1889, 22, p. 2133); by the electrolysis of the fatty acids (H. Kolbe, Ann., 1849, 69, p 257), $2C_2H_4O_2=C_2H_6+2CO_2+H_2O$; and by the action of the zinc alkyls on the ketone chlorides, $(CH_3)_2CCl_2+Zn(CH_3)_2=C_5H_{12}+ZnCl_2$. The paraffins are characterized by their great inertness towards most chemical reagents. Fuming sulphuric acid converts the middle and higher members of the series into sulphonic acids and dissolves the lower members (R. A Worstall, Amer Chem. Journ, 1898, 20, p. 664)

Dilute nitric acid, when heated with the paraffins in a tube, converts them into secondary and tertiary nitro-derivatives (M Konowalow, Ber., 1895, 28, p. 1852), whilst long boiling with strong nitric acid or nitro-sulphuric acid converts the middle and higher members of the series partly into primary mono- and di-nitro compounds and partly oxidizes them to carbonic, acetic, oxalic and succinic acids (Worstall, *ibid*, 20, p. 202; 21, p. 211). Fuming nitric acid only reacts slowly with the normal paraffins at ordinary temperature, but with those containing a tertiary carbon atom the reaction is very energetic, oxidation products (fatty acids and dibasic acids) and a small quantity of polynitro compounds being obtained (W. Markownikow, Centralblatt, 1899, 1, p. 1064; Ber., 1899, 32, p. 1441). Chlorine and bromine react with the paraffins, readily substituting hydrogen. Isomeric hydrocarbons in this series first appear with butane, the number increasing rapidly as the complexity of the molecule increases. Isomerism in the paraffin series is due to the variety of linking between the carbon atoms

Thus C—C—C—C—C is the arrangement of atoms in normal pentane but $\begin{matrix}C\\ \\C\end{matrix}\!\!>\!C—C—C$ represents the *secondary* or *iso* pentan and $\begin{matrix} & C & \\ & | & \\ C— & C & —C \\ & | & \\ & C & \end{matrix}$ is the arrangement in *tertiary* pentane Ethane C_2H_6, occurs in the natural gas associated with petroleum together with *propane* C_3H_8 and *butane* C_4H_{10}; *pentane* and higher members up to *decane* are present in petrol, probably as isomers Solid paraffin wax contains the higher members. (For methane *see* MARSH GAS.) (A. E. D)

PARAFFIN OIL, a term widely used in the United Kingdom to connote burning oil or illuminating oil for use in lamps. The corresponding American expression is kerosene and this also is commonly used in the industry. Kerosene is the distillate from any crude mineral oil (including shale oil) that boils between the approximate limits of 150° C and 300° C Legally it is defined as an oil that possesses a flash point above 73° F when observed in the standard Abel instrument. In early days paraffin oil was very liable to possess a low flash point and consequently many accidents occurred, owing to the fact that the oil gave off an inflammable vapour at moderate temperatures; to-day the flash point is usually above 100° F, because refiners are much more concerned with obtaining the maximum yield of petrol or gasolene from their crude oil, and therefore the illuminating oil coming on the market is practically free from low boiling, volatile and dangerous inflammable components. The chief criterion of a good illuminating oil is its capacity to burn with a steady highly luminous flame. This calls for great care throughout the refining operations.

The crude oil is first distilled in continuous stills arranged in benches and able to deal with upwards of 1,000 tons of oil a day. It is thus separated into naphtha and a heavy residue. This operation is called "topping" and the residue is a high flash oil that can be used as fuel or as a source of lubricating oil and waxes and pitch The naphtha is redistilled and there is obtained from it a light petrol fraction and a heavier kerosene. In the most modern plant redistillation is avoided, the crude oil is pumped through a tubular still under pressure and discharged into a tall fractionating column that is provided with a series of perforated decks, the perforations being covered by serrated cast iron hemispherical caps. This arrangement brings about intimate contact between the vapours ascending and the condensed liquid descending. The vapour of the gasolene issues from the top of the tower, which may be over 70 ft. high, whilst from a deck lower down the column may be taken kerosene. At various decks still lower down gas oil and lubricating oil are drawn and finally residue is taken from the bottom The crude kerosene distillate thus obtained although of correct flash point and boiling range, usually requires chemical treatments, to remove first colour and secondly objectionable compounds of sulphur that produce an unpleasant smell and poor burning qualities.

There is a variety of methods by which crude kerosene can be decolorised and deodorised A widely used one is to agitate the crude oil with strong sulphuric acid, which dissolves out sulphur derivatives and the coloured impurities If the mixture after thorough agitation is allowed to stand, there falls to the bottom of the agitator a heavy tar above which is the supernatant treated oil. The heavy tar is run off through a valve and the oil is washed several times with water, then with weak caustic soda and finally with water again The oil thus purified is run to storage This conventional method has many drawbacks and attempts are constantly being made to improve upon it Thus the Rumanian chemist, Edeleanu, agitates the oil with liquid sulphur dioxide, thus separating from the oil by means of their greater solubility those bodies that cause inferior burning The sulphur dioxide can be recovered and repeatedly used again Other processes aim at removing objectionable materials by filtration through fuller's earth or ignited bauxite or other adsorptive materials, whilst again a common deodorising treatment is brought about by agitation with a solution of litharge in caustic soda. (A. E. D.)

PARAGOULD, a city of north-eastern Arkansas, U.S.A, near the St. Francis river, on the Missouri Pacific and the St. Louis Southwestern railways; county seat of Greene county. Pop. (1920) 6,306 (99% native white); estimated locally at 10,000 in 1928. It has large stave factories and is an important shipping point for lumber The city was founded in 1881 and incorporated in 1884.

PARAGUAY, an inland republic of South America, bounded on the north-west by Bolivia, north and east by Brazil, south-east, south and west by Argentina. Pop. (1926 estimate) 798,969; the area of Paraguay proper is about 61,647 square miles. Sovereignty over the Chaco territory west of the Paraguay river and north of the Pilcomayo, comprising some 100,000 sq m., is disputed with Bolivia.

Physical Features.—Paraguay proper, or the country between the Paraguay and the Paraná is traversed from north to south by a broad irregular belt of highlands, which are known as the Cordillera Ambaya, Cordillera Urucury, etc., but partake rather of the character of plateaux, and form a continuation and outwork of the great interior plateau of Brazil The elevation nowhere much exceeds 2,200 feet. On the western side these

highlands terminate with a more or less sharply defined edge, the country sloping gradually up to their bases in gentle undulations with open, ill-defined valleys; on the eastern side they send out broad spurs enclosing deep-cut valleys, and the whole country retains more of an upland character. The streams that flow westward to the Paraguay are consequently to some extent navigable, while those that run eastward to the Paraná are interrupted by rapids and falls, often of a formidable description. From the Asunción plateau southwards, near the confluence of the Paraguay and Paraná, there is a vast stretch of marshy country, draining partly into the Ypoa lagoon, and smaller tracts of the same character are found in other parts of the lowlands, especially in the valley of the Paraguay. Many parts of the country sloping to the Paraná are nearly covered with dense forest, and have been left in possession of the scattered native tribes. The country sloping to the Paraguay, and comprising the greater part of the settled districts, is grassy and open, though the hills are usually covered with forest and clumps of trees are frequent in the lowlands. The soil is mostly dry, porous and sandy. (X.)

Geology.—The Paraná plateau of southern Brazil extends into eastern Paraguay, where it occupies about half the area of the country east of Paraguay river. It is a table-land formed of nearly horizontal beds of Triassic sandstone capped by late Triassic basalt and dissected by the gorges of the Paraná and its tributaries. West of the plateau is a lower foot-hill zone composed of almost horizontal Devonian and Permian beds, a southward continuation of the Palaeozoic beds exposed at the foot of the Matto Grosso plateau. The surface of the broad lowland, known west of Paraguay river as the Chaco, so far as known, is formed of Tertiary and Quaternary beds, through which protrudes, in its northern part, a low range of ancient gneiss, the Sierra de Quince Puntas. (G. McL. Wo.)

Minerals.—The gold mines said to have been concealed by the Jesuits may have had no existence; and though iron was worked by F. S. López at Ibicuy (70 m. S.E. of Asunción), and native copper, oxide of manganese, marble, lime and salt have been found, the real wealth of the country consists rather in the variety and value of its vegetable products.

Climate and Fauna.—December, January and February are generally the hottest months, and May, June, July and August the coldest. The mean temperature for the year seems to be about 74° F; for summer 81°, for winter 64°. The annual rainfall is about 62 in. at Asunción fairly well distributed throughout the year. The most common winds are from the north or south. The south wind is dry, cool and invigorating, and banishes mosquitoes for a time; the north wind is hot, moist and relaxing.

The fauna of Paraguay proper is practically the same as that of Brazil. Caymans, water-hogs (*capinchos*), several kinds of deer (*Cervus paludosus,* the largest), ounces, opossums, armadillos, vampires, the American ostrich, the ibis, the jabiru, various species popularly called partridges, the *pato real* or royal duck, the *Palamedea cornuta,* parrots and parakeets, are among the more notable forms. Insect life is especially abundant; the red stump-like ant-hills are a feature in every landscape.

Population.—The great majority of the inhabitants are of Indian (Guaraní) descent, with very slight traces of foreign blood. Civilization has not made much progress, and the habits of the people are more primitive than those in the more advanced neighbouring republics. As a general rule the Paraguayans are indolent, especially the men. Climate conditions obviate the necessity of heavy clothing. A cotton chemise, and white *manta* wrapped in Moorish fashion over head and body, constitute the dress of the women; a cotton shirt and trousers that of the men. Boots and shoes are worn only by the upper classes. Goitre and leprosy are the only endemic diseases; but the natives, being underfed, are prone to diarrhoea and dyspepsia. The common language of the country is Guaraní, although in a few districts Tupi is spoken. The country people as a rule understand a little Spanish, if living near any trading centre. Immigration is on a small scale, but tends to increase; it is encouraged by the Government, which seeks to divert to Paraguay some portion of the Italian labour immigration into Brazil and Argentina.

The principal towns with the 1926 estimate of their populations (including in each case the municipal district) are Asunción, the capital (113,684), Villa Rica (26,000), Luque (13,000), Carapegua (12,000), Paraguarí (10,000), Concepción (11,000) and Villa del Pilar (6,000); these are described in separate articles. Encarnación (7,500) on the Paraná has a large transit trade.

Government.—The constitution of the republic was voted by a constituent assembly on Nov. 25, 1870. Legislative power is vested in a Congress consisting of a Senate and a Chamber of Deputies, elected by universal manhood suffrage in the proportion of one senator for every 12,000 inhabitants and one deputy for every 6,000. Every member of Congress receives a salary of about £200. The head of the executive is the president, chosen by an electoral college for four years, and only re-eligible after eight consecutive years. He is aided by a cabinet of five ministers, responsible to Congress. The vice president is similarly elected, and is *ex officio* chairman of the Senate. The highest judicial authority is the Supreme Court, which is empowered to decide upon the constitutional validity of acts passed by Congress; its three members are appointed for four years by Congress, subject to the approval of the president. There are five courts of appeal, and inferior tribunals in all the large towns. The civil and criminal codes of Argentina have been adopted, almost without change. For purposes of local administration the republic is divided into 12 departments, subdivided into 104 counties (*partidos*).

Religion and Instruction.—Roman Catholicism is the established religion, but the Constitution guarantees full liberty to all other creeds. Asunción, the only bishopric in the State, is in the archi-episcopal province of Buenos Aires. Education is backward and was long neglected. By law it is free and compulsory, but in some districts the attendance of many children is impossible owing to lack of schools, and at least 60% of the inhabitants are illiterate. An attempt at educational progress was made by President Franco in 1916–19. In 1926 there were 90,133 pupils enrolled in 576 Government primary schools, while 3,201 pupils were attending the 21 private schools, and 800 the three national colleges at Asunción, Pilar and Villa Rica. The Colegio Internacional, an American missionary institution and the largest educational establishment in Paraguay, was opened at Asunción in 1920. There is a National university with 369 students in 1926, and 6 normal schools with 482 students.

Defence.—In 1926 the standing army numbered about 2,285 men; and there were three small armed river steamers.

Finance.—The financial situation of Paraguay has been a source of anxiety for many years. In 1885, after interest had been unpaid for 11 years on bonds amounting to £1,505,400, an agreement was made for the issue of new scrip to the value of £850,000 in quittance of all claims for capital and arrears of interest, certain public lands being also ceded to the bondholders as compensation. In 1895 an arrangement was made for a reduction of the rate of interest, for the funding of the arrears and for the creation of a sinking fund. The Government was unable to meet their obligations during a number of years and the public debt was further increased by the revolution of 1911–12, but in 1924 a new arrangement was made with the creditors for the service of this foreign debt, and the authorities have been able regularly to meet these obligations. The total outstanding debt on June 30, 1927 was 6,665,733 pesos gold and 26,804,494 pesos paper, equal to about £1,459,000. Besides this debt, there are other claims on Paraguay, including about £1,950,000 due to Brazil and about £2,500,000 due to Argentina, as a result of the war against López. These latter claims Paraguay does not recognize.

The revenue is derived from import duties, and the most important branches of expenditure are the salaries of public officials, the army, public instruction and debt. The estimated revenue for the year 1926–27 was 260,039,984 paper pesos (213·5 paper pesos to the £1) and the expenditures, 260,033,684.

Industry.—The principal industries are the cultivation and preparation of *mate* (Paraguayan tea), cotton, sugar, cattle-farming, fruit-growing, tobacco-planting and timber-cutting. The majority of the *yerbales* (tea plantations) were formerly the property of the Government, but have been acquired by private

enterprise. Cotton-growing has increased in recent years, its acreage in 1924 being 30,380. About 11,000 ac. are devoted to sugar, and there are many sugar mills largely engaged in the production of spirits.

The cattle industry is of great importance. The number of animals was estimated at 5,000,000 in 1928. The animals are small, but Durham and Hereford bulls have been introduced from Argentina to improve the breed. The increase in the herds has caused the owners of *saladero* establishments in Argentina and Uruguay to try the working of factories in Paraguay for the preparation of *tasajo* (jerked beef) and the manufacture of extracts of beef There are meat-packing plants in several cities.

Oranges, pineapples and other fruits are widely grown, mainly for local use. Tobacco, although of inferior quality, is grown to a considerable extent The staple diet is maize and mandioca (the chief ingredient in the *chipa* or Paraguayan bread).

The forests abound in such timber as quebracho, cedar, curupey, lapacho and urundey Some of these, such as the lapacho and quebracho, are of rare excellence and durability, as is shown by the wonderful state of preservation in which the woodwork of early Jesuit churches still remains The quebracho forests of the Paraguayan Chaco yield large quantities of tannin, the extracting of this having become one of the important industries of the country. Fifteen plants are known to furnish dyes, and eight are sources of fibre—the caraguatay especially being employed in the manufacture of the exquisite *nanduty* or spider-web lace of the natives Bricks, leather and furniture are manufactured also

Commerce.—The commercial situation of Paraguay has improved in consequence of the investment of foreign capital in industrial enterprise. The principal articles imported are textiles, hardware, wines, rice, canned goods and general provisions; the exports are *yerba mate*, hides, hair, meat, quebracho logs and extract, oranges and tobacco Most of the export trade is with Argentina, a large part of this being for re-shipment at Buenos Aires The values for the years 1925, 1926 and 1927 were.—

	1925	1926	1927
Imports	£3,530,550	£2,441,056	£2,395,550
Exports	3,133,235	3,099,500	2,856,400

Communications.—Numerous ocean-going liners, most of which fly the Brazilian or the Argentine flag, ply on the Paraguay and the Paraná, smaller vessels ascend the tributary streams, which are also utilized for floating lumber down to the ports. During the year 1923, 2,046 steam vessels of an aggregate tonnage of 221,488 tons entered the port of Asunción; during the same year 2,061 steam vessels of an aggregate tonnage of 226,020 tons were cleared from the port The most important railway in the republic is the Paraguay Central between Asunción and Encarnación, on the upper Paraná, a train-ferry across the Paraná affording connection with Posadas, thus shortening the journey between Buenos Aires and Asunción from five days to about 48 hours. A few other short lines bring the total railway mileage to 517. There are a few fairly good wagon roads, but most of the roads are in very poor condition.

Post and Telegraph.—Paraguay entered the Universal Postal Union in 1881. Telegraph lines connect Asunción with other towns, and two lines put the republic in communication with the rest of the world by way of Corrientes and Posadas. Wireless stations have been erected at the capital, at Concepción and at Paraguarí.

Money and Credit.—The principal banks in Paraguay are the Banco de la República, with a total authorized capital of $4,000,000, the Bank of London and South America, Ltd., the German Bank of South America, and the Banco Agrícola. The Conversion Office (Oficina de Cambios), which is authorized to sell or lend gold, was organized for the administration of the public debt. The gold and silver coinage of Paraguay are legally standardized as identical with those of Argentina (5 gold dollars or pesos=£1); but paper money is about the only circulating medium.

Weights and Measures.—The metric system is officially adopted, but the weights in common use are the *tonelada* (2,025 lb.), the *quintal* (101·4 lb.), the *arroba* (25·35 lb), the *libra* (1·014 lb.) and the *onza* (·0616 lb.). The unit for liquid measure is the *cuarta* (·1665 gal.); for dry measure the *almud* (·66 bu.) and *fanega* (1½ bu.). The land measures are the *legua* (2·689 m.), the *sino* (69⅛ sq.yd), and the *legua cuadrada* (12½ sq m.).

History.—The Indians whom the Spaniards found in Paraguay belonged to many tribes, but possessed a common language, the Guaraní. They were chiefly agriculturists and continued to live side by side with their conquerors, the culture of the country being still distinctly Indian. In 1527 Sebastian Cabot reached Paraguay and built a fort called Santo Espíritu Asunción was founded on Aug 15, 1535 by Juan de Ayolas From this centre Spanish adventurers pushed east to La Guayra, beyond the Paraná, and west into the Gran Chaco; and before long vast numbers of the less warlike natives were reduced to serfdom The name Paraguay was applied not only to the country between the Paraguay and the Paraná, but to the whole Spanish territory, which now comprises parts of Brazil, Uruguay and the Argentine provinces of Buenos Aires, Entre Ríos, Corrientes, Misiones and part of Santa Fe It was not till 1620 that Paraguay proper and Río de la Plata or Buenos Aires were separated as distinct Governments, and they were both dependent on the vice-royalty of Peru till 1776, when Buenos Aires was erected into a vice-royalty, and Paraguay placed under its jurisdiction The first Christian missions were established by the Franciscans between 1542 and 1560; but neither they nor the first Jesuit missionaries were allowed to make their enterprise a permanent success. This fell to the lot of the second band of Jesuits, Cataldino, Mazeta and Lorenzana, who began work in 1605 They succeeded in establishing a kind of *imperium in imperio*, and for a century and a half the history of Paraguay is the history of the Jesuit missions In 1750, however, Ferdinand VI of Spain ceded to the Portuguese, in exchange for the fortified village of Colonia del Sacramento (Uruguay), a part of this territory. The Jesuits resisted the transference, and it was only after several engagements that they were defeated by the combined forces of Spain and Portugal. The missions never recovered their prosperity, and the Jesuits were finally expelled in 1769 In 1811 Paraguay declared itself independent of Spain; by 1814 it was a despotism in the hands of Dr J G R Francia (*q v.*). On Francia's death, in 1840, the chief power passed to his nephew, Carlos Antonio López (*q v.*), who in 1862 was succeeded by his son Francisco Solano López In 1864 a dispute arose between the younger López and the Brazilian Government, and López marched an army through Argentine territory to invade southern Brazil. This act induced the Governments of Brazil, Uruguay and Argentina to combine for the purpose of suppressing López The invasion of Paraguay then took place, and a struggle involving an enormous sacrifice of life and treasure lasted for five years, only coming to a close when the Paraguayan forces were totally defeated and López was killed at the battle of Aquidaban on March 1, 1870 During this warfare every male Paraguayan capable of bearing arms was forced to fight, whole regiments being formed of boys from 12 to 15 years of age. Even women were used as beasts of burden to carry ammunition and stores, and when no longer capable of work were left to die by the roadside or murdered to avoid any ill consequences occurring from their capture When the war broke out the population of Paraguay was 1,337,439; when hostilities ceased it consisted of 28,746 men, 106,254 women above 15 years of age, and 86,079 children

After the death of López the Government was administered by a triumvirate consisting of Cirilo Rivarola, Carlos Loizaga and José Díaz de Bedoza, until, in Nov. 1870, the present Constitution was formulated The policy of Brazil was for a time directed towards the annexation of Paraguay; the debt due to Brazil on account of the war was assessed at £40,000,000, a sum which Paraguay could never hope to pay; and it was not until 1876 that the Brazilian army of occupation was wholly withdrawn. But the rivalry between Brazil and Argentina, and the necessity of maintaining the balance of power among the South American republics, enabled Paraguay to remain independent. No violent constitutional change took place after 1870, though there have been spasmodic outbreaks of revolution, as in 1881, in 1894, in 1898, in 1904, in 1908 and in 1909. None of these disturbances deeply or permanently affected the welfare of the republic, nor

were all of them accompanied by bloodshed. Under the presidency of J. B. Egusquiza (1894–98) the boundary dispute with Bolivia became acute; but war was averted, largely owing to the success of the revolution, which forced the president to resign. The main interest of recent Paraguayan history is economic rather than political. In that history the gradual development of commerce, the financial reforms in 1895, and the extension of the Paraguay Central railway were events of far greater importance than any political movement which took place between 1870 and 1910. In 1911 a series of revolutions forced Dr. Manuel Gondra (recently inaugurated) out of the presidency and brought into office four provisional presidents in rapid succession during that and the following year. In 1912, however, a peaceful succession took place and Dr. Eduardo Schaerer was allowed to complete his full term, 1912–16. During his administration the country recovered somewhat from the effects of its unfortunate disturbances. He was followed by Dr. Manuel Franco, under whose direction the condition of the country improved still further. Upon his death (1919) the remainder of the term was filled by Dr. José P. Montero, after which Gondra was elected for a second time. The latter, however was forced to resign in 1921 under pressure of threatened revolts and the administration of his successor, Eusebio Ayala (provisional president), was no less turbulent. This situation terminated in 1923 when Elijio Ayala was elected for the term, 1924–28, a period which has been one of the most peaceful and prosperous in the history of Paraguay. In April 1928, Don José P. Gugguiari was elected president.

During the World War Paraguay remained neutral but toward the latter part of the conflict she displayed a decided pro-Ally attitude, and dismissed some of her German employees. In 1919 she joined the League of Nations. Her boundary dispute with Bolivia became acute in 1926, but the following year the two countries signed a protocol creating an international boundary commission and agreed to arbitrate the question in case of failure to arrive at a direct solution. In spite of this agreement, actual armed clashes took place along the disputed border late in 1928. In 1927 there began an immigration of Mennonites into Paraguay, and by the middle of 1928 at least 2,000 of them had arrived.

(G. M. McB.)

PARAHYBA (Parahiba or Parahyba do Norte), a State of north-eastern Brazil, bounded north by Rio Grande do Norte, east by the Atlantic, south by Pernambuco and west by Ceará. Pop. (1920), 961,106. Area, 21,585 sq. miles. It consists of a narrow coastal zone, 30 to 40 m. wide, along the seaboard, behind which the country rises sharply to a highland region forming part of the great central plateau of Brazil. The long dry season (April to October), together with occasional devastating droughts (*séccas*) lasting two or more years, prevents the development of forests and damages the agricultural and pastoral industries of the State. There is only one river of importance, the Parahyba do Norte, which crosses the southern part of the State from west to east with a course of about 240 miles. In the lowlands and some of the river valleys agriculture is the chief occupation of the people; cotton and sugar are extensively produced and some tobacco is grown. The exports include hides, skins, cotton, sugar and tobacco. Rubber of the Ceará type is also found and forms an item among the smaller exports. The eastern extremity of the State is served by a railway originally called the Conde d'Eu railway but now forming part of the Great Western of Brazil system. The capital is Parahyba (*q.v.*). Other important towns are: Bananeiras, Campina Grande, Guarabira, Pombal, and Souza.

Parahyba formed part of the original grant, known as the *capitania* of Itamaracá, from the Portuguese Crown to Pero Lopes de Souza. It was not settled until 1584, when a fort was erected near the present port of Cabedello under the name of São Filippe.

PARAHYBA (PARAHYBA DO NORTE), a city and port of Brazil, capital of Parahyba State, on the right bank of the Parahyba do Norte river, 11 m. above its mouth and 65 m. N. of Recife. Pop., including the municipal district (1920), 52,990. Parahyba is the starting-point of the Conde d'Eu railway, now a part of the Great Western of Brazil system. Its port is Cabedello, with which it is connected by rail. The entrance to the Parahyba do Norte river being obstructed by a stone reef and sand bars, only vessels drawing less than 14 ft. can effect an entrance. The "Varadouro," as the lower part of the city is called, is built on the margin of the river and is devoted principally to commerce. Behind this is a low hill on whose northern slope and broad summit the upper city is built, and a tramway line runs to the suburb of Trincheira. There are some good public buildings, including the parish church (*matriz*) of N.S. das Neves, the old Franciscan convent and church, the government palace, and the Treasury. There are a normal school, a lyceum, a national gymnasium, and a school for marine apprentices. Parahyba was founded in 1585. It was called Frederickstadt by the Dutch, and Felippéa after the Spanish king when the Dutch were expelled.

PARAHYBA DO SUL, a river of Brazil, having its source on the *campos* of Bocaina, on the northern slope of the Serra do Mar in the western part of the state of São Paulo, and flowing at first south-westerly and then after a horse-shoe curve in the vicinity of Jacarehy in a general east-north-east direction to the Atlantic in lat. 21° 38′ S. Its upper course for a distance of 80m., or to the confluence of the Parahybuna, is known as the Parahytinga. The navigable channel from São Fidelis to the Atlantic is 54m. long, and the total length of the river, including the Parahytinga, is 540m. Its source is about 4,920ft. above sea-level. The Parahyba passes through a fertile, long-settled country, a part of which was long the chief coffee-producing region of Brazil.

PARAKEET: *see* Parrot.

PARALDEHYDE (para-acetaldehyde, paraldehydum in British and U.S. *Pharmacopoeia; see* also Aldehydes), a colourless liquid of characteristic odour and soluble in ten parts of water. It boils at 124° C (m.p. 12·5° C). Paraldehyde is a powerful hypnotic without depressing effect on the heart, and, being largely excreted by the lungs, is beneficial in bronchial asthma. Used intravenously, it acts as an anaesthetic and hypnotic. It is produced by polymerizing acetaldehyde with a trace of sulphuric acid; with the concentrated acid this reaction is accompanied by considerable generation of heat. The resulting liquid is neutralized with calcium carbonate and purified by fractional distillation. Paraldehyde has the same molecular formula $(CH_3{\cdot}CHO)_3$ both in the gaseous phase and in solution.

PARALLAX (παράλλαξις) is the difference in direction of a body caused by a change in the position of the observer. For members of the solar system the word is more specifically used to mean the difference in direction as seen from the observer and from the earth's centre. It is used in this sense by Ptolemy. In fig. 1, let O be the observer, E the centre of the earth, and M the position of the moon, planet or sun, then the angle OME is the parallax. This varies with the altitude and is greatest when the body is on the horizon. At zenith distance z $\sin p = \frac{a}{r} \sin z$. When $z = 90°$, $\sin p = \frac{a}{r}$ and this value of p is called the horizontal parallax or briefly the parallax. For all bodies but the moon, p is so small that it does not differ appreciably from $\sin p$, and is usually expressed in sexagesimal measure. A further refinement is required owing to the spheroidal figure of the earth and the numerical values generally given are those of the *Equatorial horizontal parallax.*

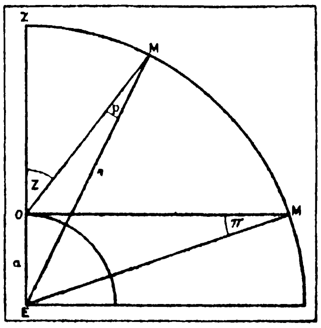

FIG. 1.—CHANGE OF PARALLACTIC ANGLE WITH ALTITUDE

Lunar Parallax.—The moon being by far the nearest of the celestial bodies was the first to have its parallax determined. Hipparchus showed that the sum of the parallaxes of the sun and moon was equal to the sum of the angular radii of the sun and of the shadow of the earth thrown on the moon in a lunar eclipse. If the parallax of the sun be considered as inappreciable compared with that of the moon, the moon's parallax is found to be 58′.

Parallax of the moon is directly determined from observations of declination made at two places like Greenwich and the Cape which are nearly on the same meridian. The theory of the observations will be readily grasped from fig. 2.

The angles z_1 and z_2 are observed and other data are obtained from the latitude of the observatories and the known size and shape of the earth. In practice, stars are observed in positions near the moon in order to eliminate uncertainties of refraction and instrumental errors. In this way Henderson obtained a value of 57′2″·3 for the moon's equatorial horizontal parallax in 1837. From a series of observations of a small lunar crater in the years 1905–10 the value 57′2″·5 was found.

A second method rests on a comparison of the force of gravity at the earth's surface with its value at the moon. If M and m be

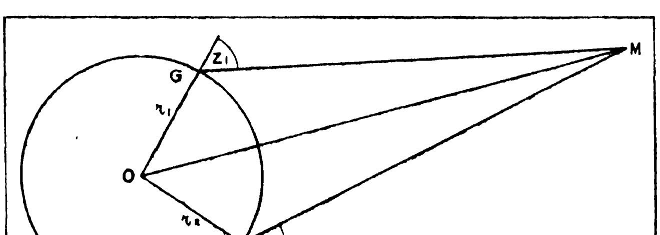

FIG 2—MEASUREMENT OF PARALLAX BY OBSERVATIONS FROM A NORTHERN AND A SOUTHERN OBSERVATORY
If the angles Z_1 and Z_2 are accurately observed at Greenwich and the Cape, and the form of the earth and the positions of these places on it are accurately known, a diagram drawn to the scale will give the moon's distance

the masses of the earth and moon, r the mean distance, and P the sidereal period of revolution of the moon about the earth $M+m = 4\pi^2 r^3/P^2$ where $\pi = 3{\cdot}14$. Also, g, the value of gravity at the earth's surface, determined accurately from pendulum observations $= M/a^2$. Hence $\left(\frac{a}{r}\right)^3 = 4\pi^2 \frac{M}{M+m} \cdot \frac{a}{gP^2}$. As the quantities on the right hand side are known with great accuracy, $\frac{a}{r}$ is accurately determined as 57′2″·7

Solar Parallax. Trigonometrical Methods.—In accordance with the law of gravitation the relative distances of the planets are known, and tables of their positions and movements take the distance of the sun from the earth as unit of length. To determine the value of this unit, it is only necessary to obtain the distance or parallax of one of the planets at a time when it is nearest the earth. The first accurate determination of the sun's parallax was obtained in 1672 from a series of observations of Mars when in opposition made in South America and Paris, from which a value of 9″·5 was obtained. The utilization of the transit of Venus for this purpose was advocated by Halley, and at the transit of 1769, the times of ingress and egress of the planet on the sun's disk were observed by astronomers dispatched to various parts of the globe, including Capt. Cook in Otaheite. From these observations a value of 8″·6 was obtained. The transits of 1874 and 1882 were widely observed for the same purpose, but the results were disappointing owing to the impossibility of precise determination of the times of ingress and egress In 1877 Gill made an expedition to the island of Ascension and observed the opposition of Mars, using a heliometer to measure the distance of the planet from neighbouring stars. He made his observations after sunset and before sunrise, the parallactic displacement of the planet from its calculated position as seen from the centre of the earth being in opposite senses and of largest amount at these times. A value of 8″·78 was deduced. The successful result of this series of observations led Gill to make a very elaborate series of heliometer observations of the small planets Victoria, Iris and Sappho, in 1888 and 1889, when they were in opposition. The resulting value of the solar parallax was 8″·80.

In 1898 De Witt discovered the small planet Eros which at its nearest approach comes to within 15 million miles or one-sixth of the sun's distance The opposition of 1900 was extensively observed visually and photographically at many observatories. The collection and discussion of the extensive series of observations was made by Mr. Hinks who obtained the value for the solar parallax 8″·804±″·004. A still nearer approach of this planet to the earth will occur in 1931

Methods Depending on Velocity of Light.—The value of the velocity of light has been determined by Michelson with great precision and may be utilized in several different ways. A direct method is the converse of the procedure of Römer in the discovery of the velocity of light; *i e*, to use the light equation, or time taken by the light to reach us at the varying distances of Jupiter Great accuracy is hardly obtainable in this way A second method is by means of the constant of aberration which gives the ratio of the velocity of the earth in its orbit to the velocity of light As aberration produces an annual term of amplitude 20″ in the positions of all stars its amount has been determined in numerous ways One of the latest determinations—that made at Greenwich in the years 1911 to 1918 gave the value 20″·445±″·013 leading to the value 8″·810±″·006 for solar parallax. This method is not free from the suspicion of systematic error.

The velocities of stars towards or from the earth are determined from spectroscopic observations. By choosing times when the orbital motion of the earth is carrying it towards or from a star the velocity of the earth in its orbit may be obtained. In this way the solar parallax was found from observations at the Cape of Good Hope to be 8″·802±″·004.

Gravitational Methods.—(1) In the theory of the moon there is a term of period one month known as the parallactic inequality. The coefficient of the term contains the ratio of the parallaxes of the sun and moon as a factor. The large size of this coefficient makes it of value. From the discussion of occultations of stars at the Cape observatory, Jones finds the value 125″·15±″·06 for this term giving for the solar parallax 8″8·805±″·004.

(2) The ratio of the mass of the earth+moon to that of the sun may be determined from the disturbing action of the earth+moon on the elliptic motion of the planets. The ratio of the moon's mass to that of the earth is 1 81·53, and thus the ratio of the earth's mass to that of the sun is found In a manner similar to that described above for the moon's parallax the solar parallax is then derived. From an exhaustive discussion of the perturbations of the planet Eros Noteboom has made a very accurate

determination of the solar parallax as 8″·799.

There is thus a general agreement of different methods that the solar parallax is not far from 8″·804. This corresponds to a mean distance of the sun of 149,500,000 kilometres or 92,900,000 miles.

Stellar Parallax.—The stars are too distant for any difference of position to be perceptible from two places on the earth's surface; but as the earth is 93 million miles from the sun, stars are seen from widely different view points in the course of the year. The effect on their positions is called *annual parallax,* defined as the difference in position of a star as seen from the earth and sun. Its amount and direction varies with the time of year, and its maximum is a/r where a is the radius of the earth's orbit and r the distance of the star. The quantity is very small and never reaches 1/206,265 in radian or 1″ in sexagesimal measure. Unsuccessful attempts to measure the parallax of a star were made continuously after the acceptance of the Copernican system, including one by Bradley which led to the discovery of aberration (*see* ABERRATION OF LIGHT) and by Herschel which led to the discovery of binary stars. The first successful results were obtained in 1838 when the parallax of α Centauri was announced by Henderson, α Lyrae by Struve and 61 Cygni by Bessel. For his observations Bessel used the heliometer, an instrument constructed by Fraunhofer, in which the object glass is cut in two, and so mounted that the whole can be rotated, and the separate halves made to slide relatively to one another and their movement measured with great precision. In this way the distance between two stars is measured by the separation of the two halves required to make the images of the two stars coincident. Bessel found small movements of 61 Cygni relative to two neighbouring stars which from their magnitude and want of proper motion were judged to be so distant that no parallactic effect could be perceived. With instruments of this kind having small object glasses of not more than 4 or 6in. and focal lengths of a few feet, research on stellar parallax was carried on to the end of the 19th century and the parallaxes determined of approximately 100 of the brightest stars and those showing the largest proper motion. The introduction of photography simplified the problem, and after the researches of Hinks and Russell at Cambridge, and still more of Schlesinger at Yerkes, a number of observatories have engaged in the work and have determined the parallaxes of many stars with great accuracy. Two observational conditions have to be fulfilled (1) The telescope must be in the same position for observations at different times of the year. (2) By some means, *e.g.*, a rotating shutter with a suitable slit—the photographic image of the star observed must be made equal to that of the stars with whose position it is compared. In practice, a few photographs are taken when the star is on the meridian shortly after sunset at one period of the year and shortly before sunrise at another period. As the stars' positions change owing to their proper motion, a minimum of three epochs is required but the possibility of systematic errors make it desirable to extend the observations over a larger number of epochs. With 25 photographs spread over five epochs, the parallax of a star is obtained with a probable error of less than ±0″·010, although the diameter of the photographic disk of the star is seldom less than 2″·0. The concerted action of the observatories of Allegheny, McCormick, Swarthmore, Dearborn, Yerkes, Mount Wilson and Greenwich has resulted in the determination of the parallaxes of 1,800 stars, 1,600 north and 200 south of the Equator. The determination of parallaxes of stars in the Southern hemisphere has been commenced at the Yale Observatory at Johannesburg and the Royal Observatory at the Cape, and will in a few years correct this large disparity. In the Northern hemisphere the parallaxes have been measured of 191 of the 207 stars brighter than $4^{m}0.381$ of 1,041 stars between $4^{m}0$ and $5^{m}5$ and of many stars whose comparative nearness is suggested by their large proper motions. Rather more than one half of the stars have parallaxes greater than 0″·02 or are within 50 parsecs of us, a parsec being defined as the distance of a star whose parallax is 1″ and equal to 206,265 times the earth's distance from the sun or approximately 19 million million miles.

Between the distances of 1 and 5 parsecs, 23 stars have been found, of which seven are double stars. These include the bright stars α Centauri, Sirius and Procyon and three stars below the 10th magnitude.

(2) If a star is moving at an inclination i to the tangent plane of the celestial sphere, its angular velocity $\frac{V}{r}\cos i$ can be compared with its linear velocity $V \sin i$ in the line of sight obtained from spectroscopic observations. For some double stars and for several open clusters of stars i is known and accurate values of the parallax have been determined for Capella, the Taurus and the Great Bear clusters.

(3) For the more distant stars, trigonometrical methods are inapplicable, but the parallax can be derived from the apparent magnitude of the star, if there are any means of knowing the absolute magnitude of the star; *i.e.*, the magnitude the star would have at the standard distance of 10 parsecs. For Cepheid Variables this can be inferred with considerable accuracy from their periods, and for many stars a reasonable guess can be made from the spectral type and proper motion. The formula connecting absolute magnitude and apparent magnitude with parallax is $M = m + 5 + 5\log \pi$ and expresses the condition that the light received from a star varies inversely as the square of the distance.

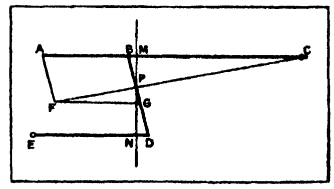
(4) **Spectroscopic Parallaxes.**—Stellar spectra are arranged in a sequence which represents the effective temperatures of the stars. In 1914 Adams and Kohlschütter found differences in the intensities of certain lines in stars of the same type of spectrum, dependent on the absolute luminosities of the stars, or slight difference in the spectra of great and small stars of the same surface temperature. By photometric comparison of neighbouring lines, one invariable, and the other varying with the size of the star, the absolute magnitude of a star is determinable, and the parallax by means of the formula given above. This method has been applied extensively to most of the brighter stars in the Northern hemisphere, using stars of known parallax as standards.

Average Parallaxes.—The solar system is moving through space with a velocity of 19·5 km./sec., carrying it four times the earth's distance from the sun in one year. This produces a general drift in the angular movement of the stars away from the apex or point in the sky to which the movement is directed. Were the stars at rest, this would give a ready means of determining their individual distances. As the stars are all moving, the method gives the average distance of a group of stars examined, on the assumption that their peculiar motions are eliminated. In this way the mean parallaxes of stars of successive apparent magnitudes of different galactic latitudes and of different spectral types are obtained. Thus the mean parallax of 5th magnitude stars: *i.e.*, of stars just visible to the naked eye—is ″·018; and of the 10th magnitude stars; i.e. of stars giving $\frac{1}{100}$ of their light—is ″·0027.

As spectroscopic observations have given the mean peculiar velocities of stars of different types, the average proper motions perpendicular to the direction of the solar motion may also be used as a criterion of parallax. There is a very great diversity in the parallaxes of individual stars included in these mean values.

(F. D.)

PARALLEL MOTION, an arrangement of links, invented by James Watt, and used in the older types of steam-engines (*see* STEAM-ENGINE) to connect the head of the piston rod, moving up and down in a vertical path, with the end of the beam, moving in the arc of a circle. An ordinary form is shown diagrammatically in the figure. MN is the path in which the piston-rod head is to be guided. ABC is the middle line of half the beam, C being the fixed centre about which the beam oscillates. A link BD connects a point in the beam with a radius link ED, which oscillates about a fixed centre at E. A point P in BD, taken so that BP:DP::EN:CM, moves in a path which coincides very closely with the straight line MPN. Any other point F in the line CP or CP produced is made to copy this motion by means of the links AF and FG, parallel to BD and AC. In the ordinary application of parallel motion, a point such as F is the point of attachment



of the piston-rod, and P is used to drive a pump-rod. Other points in the line CP produced are occasionally made use of by adding other links parallel to AC and BD. Watt's linkage gives no more than an approximation to straight-line motion, but in a well-designed example the amount of deviation need not exceed one four-thousandth of the length of stroke. It was for long believed that the production of an exact straight-line motion by pure linkage was impossible, until the problem was solved by the invention of the Peaucellier cell (*See* also MECHANICS)

PARALYSIS or **PALSY,** a medical term usually implying the loss or impairment of voluntary muscular power Paralysis is rather a symptom than a disease *per se;* it may arise (1) from injury or disease of nervous and muscular structures (*organic paralysis*), or (2) from purely dynamic disturbances in the nervous structures of the brain which preside over voluntary movement. The latter is *functional motor paralysis,* a symptom common in certain neuroses, especially hysteria For *general paralysis of the insane, see* INSANITY.

Whether the loss of motor power be functional or organic, it may be generalized in all the muscles of the body, or localized to one or many The different forms of paralysis which may arise from organic disease can be understood by a consideration of the motor path of voluntary impulses from brain to muscle There are two neural segments in this path, an upper cerebral and a lower spinal; the former has its departure platform in the brain and its terminus in the whole of the anterior grey matter of the spinal cord, whence issues the lower spinal segment of the motor path to the muscles The nerve fibres of the upper cerebral segment are prolongations of the large psycho-motor cells; the nerve fibres of the lower segment are prolongations by the anterior roots and motor nerves of the large cells in the grey matter of the cord Disease or destruction of any part of the upper cerebral segment will give rise to loss of voluntary power, for the influence of the mind on the muscles is removed in proportion to the destruction of this efferent path Disease or destruction of the lower spinal segment causes not only loss of voluntary power but an atrophy of the muscles themselves

Paralysis may therefore be divided into three great groups: (1) loss of voluntary power without muscular wasting except from disuse, and without electrical changes in the muscles due to injury or disease in the upper cerebral segment, (2) loss of muscular power with wasting and electrical changes in the muscles due to disease or injury in some part of the lower spinal segment; (3) primary wasting of the muscles

The more common forms of paralysis will now be described.

Hemiplegia, or paralysis affecting one side of the body, is a frequent result of apoplexy (*q v.*); there is loss of motion of the tongue, face, trunk and extremities on the side of the body opposite the lesion in the brain In complete hemiplegia both arm and leg are powerless; the face is paralysed chiefly in the lower part, while the upper part moves almost as well as on the unparalysed side, and the eye can be shut at will, unlike peripheral facial paralysis (Bell's palsy). The tongue when protruded deviates towards the paralysed side, and the muscles of mastication contract equally in ordinary action, although difficulty arises in eating, from food accumulating between the cheek and gums on the paralysed side Speech is thick and indistinct, and when there is right-sided hemiplegia in a right-handed person, there may be associated various forms of aphasia (*q.v*), because the speech centres are in the left hemisphere of the brain. Some muscles are completely paralysed, others are merely weakened, while others, *e.g.,* the trunk muscles, are *apparently* unaffected

In many cases of even complete hemiplegia, improvement, especially in children, takes place after a few weeks or months, and is generally first indicated by return of movement in the muscles which are habitually associated in their action with those of the opposite unparalysed side; thus, movement of the leg returns first at the hip and knee joints, and of the arm at the shoulder and elbow, although the hand may remain motionless. The recovery, however, in the majority of cases is only partial, and the sufferer is left with a permanent weakness of one side of the body, often associated with contracture and rigidity, giving rise to a characteristic gait and attitude.

According to the part of the brain damaged variations of paralytic symptoms may arise; thus occasionally the paralysis may be limited more or less to the face, the arm or the leg In such case it is termed a *monoplegia,* a condition sometimes arising from cerebral tumour. Occasionally the face is paralysed on one side and the arm and leg on the other (*alternate hemiplegia*); this is because the disease has damaged the motor path from the brain to the leg and arm before it has crossed over to the opposite side, whereas the path to the face muscles is damaged after it has crossed In rare cases both leg, arm and face on one side may be paralysed—*triplegia;* or all four limbs—*bilateral hemiplegia* Infantile spastic paralysis, *infantile diplegia,* is a *birth palsy* caused by injury from protracted labour, the use of forceps or other causes The symptoms are generally not observed until long after birth. Convulsions are common, and the child is unable to sit up or walk long after the age at which it should do so

Paraplegia implies paralysis of the lower extremities; in the great majority of instances it arises from a local or general disease or injury of the spinal cord A localized transverse myelitis will interrupt the motor and sensory paths which connect the brain with the spinal grey matter below the lesion; thus fracture, dislocation and disease of the spinal column (*e g* , tubercular caries, syphilitic disease of the membranes, localized tumours and haemorrhages) may cause compression and inflammatory softening, and the result is paralysis of the voluntary muscles, loss of sensation, loss of control over the bowel and bladder, and a great tendency to the development of bedsores The muscles do not waste except from disuse, nor undergo electrical changes unless the disease affects extensively the spinal grey matter or roots as well as the cerebral path When it does so, as in the case of *acute spreading myelitis,* the symptoms are usually more severe and the outlook is more grave.

In *focal myelitis* from injury or disease, a good measure of recovery may take place by keeping the patient on his back in bed, daily practising massage and passive movements, and so managing the case as to avoid bedsores and septic inflammation of the bladder

Paralysis may also result from acute inflammatory affections of the spinal cord involving the grey and white matter—*myelitis* (*see* NEUROPATHOLOGY)

Infantile or Essential Paralysis.—This is a form of spinal paralysis occurring with frequency in young children; in Scandinavian countries the disease is prevalent and sometimes assumes an epidemic form The names *infantile* and *essential* paralysis were given before the true nature of the disease in the spinal cord was known; the same affection may occur, however, in adults The medical name is *acute anterior poliomyelitis,* because the anterior grey matter of the spinal cord is the seat of acute inflammation, and destruction of the spinal motor nerve path to the muscles. The term *atrophic spinal paralysis* is sometimes employed as indicating the wasting of muscles that results

Infantile paralysis often commences suddenly, and the paralysis may not be observed until a few days have elapsed; the earliest symptoms are fever, convulsions and sometimes vomiting; and, if the child is old enough, it may complain of pains or numbness or tingling in the limb or limbs which are subsequently found to be paralysed It is characteristic, however, of the disease that there is no loss of sensation in the paralysed limb. The whole of the limb is not necessarily paralysed, often it is only a group of muscles, and even if the paralysis affects both legs or the arm and leg on one side, it generally fails in the uniform distribution of paraplegia or hemiplegia The affected muscles rapidly waste and become flaccid, the electrical reactions change, and finally the muscles may cease to respond to electrical stimulation altogether In the less severe cases (and they are the most common) only a group of muscles undergo complete paralysis and atrophy, and there is always hope of some return of power in a paralysed limb Associated with the withered condition of the limb due to the muscular atrophy is an enfeebled circulation, rendering the limb cold, blue and livid; the nutrition of the bones and other parts is involved, so that a limb paralysed in early infancy does

not grow and is shorter than its fellow. Deformities arise, some the result of failing muscular support; others due to permanent changes in the position of the limbs, for example clubfoot. There is absence of bladder and bowel troubles, and bedsores do not occur; the disease itself is rarely, if ever, fatal. About a month after onset of the disease every effort should be made by massage, by suitable positions and passive movements to promote the circulation and prevent deformities in the affected limbs. Should these measures fail, surgical aid should be sought.

Wasting Palsy.—This is a chronic disease characterized by slow and insidious weakness and wasting of groups of muscles from disease of the anterior spinal grey matter. It begins mostly between 25 and 45 years of age, and affects males more than females. Usually it commences in the upper limbs, and the small muscles of the hand are especially liable to be affected. The muscles next most liable to atrophy are those of the shoulder and upper arm, and the atrophy may thence spread to the neck and trunk, and the intercostals and even the diaphragm may be affected, causing serious difficulties of respiration. The lower extremities are less often and later affected. This disease generally runs a slow and progressive course. A characteristic feature is fibrillary twitching of the wasting muscles. The electrical excitability of the muscles is diminished rather than changed, except where the wasting is extreme, when a partial reaction of degeneration may be obtained. Sensation is unaffected. There is no affection of the bowel or bladder. Death usually occurs from intercurrent diseases, *e.g.*, bronchitis, pneumonia or broncho-pneumonia. Some patients die owing to failure of the respiratory muscles; others from the disease spreading to the medulla oblongata (the bulb of the brain) and causing bulbar paralysis. The destruction of spinal motor cells which is the essential pathological feature of this disease is generally accompanied, and sometimes preceded, by degeneration of the path of voluntary impulses from the brain. It is then called *amyotrophic lateral sclerosis,* a rapid form of progressive muscular atrophy.

Bulbar Paralysis.—Various morbid conditions may give rise to a group of symptoms, the principal features of which are paralysis of the muscles concerned in speech, swallowing, phonation and mastication. These symptoms may arise suddenly from vascular lesions or inflammatory processes, which involve the nuclei of origin of the cranial nerves supplying the muscles of the tongue, lips, pharynx and larynx. But there is also a slow degenerative insidious *progressive bulbar paralysis* affecting both sexes pretty equally; it comes on between 40 and 60 years of age, and the cause is unknown. Slight indistinctness of speech is usually the first symptom. Later, owing to paralysis of the soft palate, the speech becomes nasal in character. Sooner or later there is a difficulty of swallowing, and liquids are apt to regurgitate through the nostrils. As the disease proceeds, the laryngeal muscles become affected; the pitch of the voice is lowered and the glottis is imperfectly closed during deglutition; there is consequently a tendency for liquids and food to pass into the larynx and set up fits of coughing. Later the muscles of mastication are affected and the disease may extend to the respiratory centre. The intellectual faculties are as a rule unimpaired, although the facial expression and the curious emotional mobility of the countenance, would suggest weak-mindedness. Whilst the lower half of the face is strikingly affected, the upper half retains its normal expression and power of movement. This disease is usually rapidly fatal.

Bulbar Paralysis Without Anatomical Change.—This condition is also termed "myasthenia gravis"; it differs from acute and chronic bulbar disease by the absence of muscular atrophy, normal electrical excitability of the muscles, marked development of the paralysis by fatigue, and considerable remissions of the symptoms. The bulbar symptoms are the most prominent, but all voluntary muscles are more or less affected.

Paralysis may result further from disease or injury of the motor path to the muscles in the peripheral nervous system.

Neuritis.—Paralysis may arise in a muscle, a group of muscles, a whole limb, the lower extremities, or there may be a generalized paralysis of voluntary muscles as a result of neuritis. A typical example of neuritis giving rise to paralysis owing to inflammatory swelling and compression is afforded by the facial nerve; this purely motor nerve as it passes out of the skull through a narrow bony passage is easily compressed and its function interfered with, causing a paralysis of the whole of one side of the face and *Bell's Palsy.* Exposure to a cold draught in a person with rheumatic diathesis is a frequent cause.

Lead poisoning (*q.v.*) may give rise to a localized neuritis affecting the posterior inter-osseous nerve, especially in painters and in those whose occupations necessitate excessive use of the extensors of the forearm; the result is *wrist drop* or *lead palsy.*

Sciatica and Multiple Neuritis.—*Sciatica* is a painful inflammatory condition of the sciatic nerve, in which there may be weakness of the muscles; but inability to move the limb is more on account of the pain it causes than on account of paralysis of the muscles. Exposure to cold and wet, *e.g.*, sitting on a damp seat, may lead to sciatica in a gouty or rheumatic person.

Multiple neuritis (*see* NEURITIS) is a painful generalized inflammation of the peripheral nervous system and arises in many toxic conditions of the blood; among the most important are lead, arsenic and chronic alcohol poisoning. It also occurs in diabetes, diphtheria and beri-beri (*see* NEUROPATHOLOGY).

Paralysis—termed medically muscular dystrophies—may arise from a primary atrophy of muscle apparently independent of any discoverable change in the nervous system, but due to a *congenital* developmental defect of the muscles. Heredity plays an important part in the incidence of these diseases. There may be a tendency in a family to the affection of one sex and not the other; on the other hand, children of both sexes may suffer in the same family. It is curious that the majority of cases are males, and that it is transmitted by women who are not themselves its subjects.

The muscular dystrophies may be divided into two groups according to the period of life in which the malady manifests itself: (1) Those occurring in childhood; (2) those occurring in youth or adult life. In the first group the muscles may be atrophied or *apparently* hypertrophied. In the latter instance the child looks like an infant Hercules, with abnormally large calves and buttocks, yet it stands with its feet widely separated; waddles along rather than walks; falls easily and rises with difficulty, having to use the hands to push against the floor; it then rests one hand on the knee, and then the other hand on the other knee, and climbs, as it were, up its own thighs in order to assume the erect posture. In this pseudo-hypertrophic form of paralysis, there is little hope of the patient reaching adult life.

Paralysis Agitans, otherwise known as *Shaking Palsy* or *Parkinson's Disease,* this is a chronic progressive disease of the nervous system occurring late in life, and characterized by weakness, tremors and stiffness of the muscles associated with a peculiar attitude and gait. The first sign of the disease is weakness followed by tremor of one hand; this consists of continuous movements of the thumb and forefinger as in rolling a pill, or of movements of the hand like beating a tom-tom; then the other hand is affected, and later there is tremor at the ankle. In some cases there is a continual nodding movement of the head. These tremors are at the rate of five per second and cease during sleep. The attitude and gait are very characteristic; the head is bent forward, and the patient in beginning to walk takes slow steps, which soon become short and quick. The intellect is clear and in marked contrast to the mask-like expression. This disease lasts for years, and but little can be done in the way of treatment.

Treatment.—There are certain principles in the treatment of all forms of paralysis which may be summarized as follows.

1. Rest in bed and attention to the vital functions of the body, the heart's action, the respiratory functions, nutrition and excretion. The pulse is the best guide to the administration of drugs and stimulants. As regards the respiratory function, one of the dangers of paralysis is an intercurrent pneumonia—sometimes unavoidable, often due, however, to attempts to give nourishment to a patient in an insensible state, with the result that some of the fluid enters the bronchial tubes, when either the reflex protective coughing is not excited or is ineffectual. Attention to the

bowels and bladder is most important. A purge at the onset of paralysis is indicated when the pulse is full and of high tension, and the regular action of the bowels is necessary in all conditions. Retention of urine should be carefully avoided, if necessary by the passing of a catheter, but too much emphasis cannot be laid upon the importance of adopting aseptic precautions to avoid infection of the bladder. Daily inspection of the back should be made of all paralysed patients, and precautions taken to keep the skin of all parts exposed to pressure clean; the back should be laved with eau-de-Cologne or spirit to harden the skin. Any sign of a red spot on the back or buttock of the paralysed side should be a warning note of the possibility of a bedsore; zinc powder or ointment should be applied and the effect of pressure on the part be removed if possible by change of posture and by the use of a water-bed. It is important to cover all warm bottles with flannel, for owing to insensibility large blisters, which heal with difficulty, may result. In cases of paraplegia the legs should be covered with warm woollen hand-knitted stockings, and a cradle employed to protect the feet from the continuous weight of the bed-clothes, a fruitful source of foot drop

2. As soon as the acute symptoms have passed off passive movement and massage may be employed with advantage; in some cases electrical treatment is indicated; but as a rule, especially in children, electrical treatment offers the disadvantage of being painful and not accomplishing more than can be effected by massage and passive movements. When the passive movements are being made the patient should be instructed by the operator to will the movement which he is performing, and thus try to re-establish the connection of the brain with the muscles through the point of interruption or by a new path if that is not possible. (F. W. Mo.)

For bibliography *see* Thomas L Houlton, "General Paralysis" (*Archives of Neurology and Psychiatry*), 1927.

PARAMARIBO, the capital of Dutch Guiana or Surinam (*see* GUIANA), in 5° 44′ 30″ N, 55° 12′ 54″ W, 20 m. from the sea on the right bank of the Surinam, here a tidal river nearly a mile broad and 18 ft. deep Pop. (1925), 38,191. Built on a plateau about 16 ft. above low-water level, Paramaribo is well drained, clean and in general healthy. The straight canals, the broad, tree-planted streets, the spacious squares, and the solid public buildings recall Holland.

The Indian village of Paramaribo became the site of a French settlement probably in 1640, and in 1650 it was made the capital of the colony by Lord Willoughby of Parham The town was partly burned down in 1821, and again in 1832

PARAMECIUM (often misspelt Paramaecium, Paramoecium), the slipper animalcule, a genus of aspirotrochous ciliate Infusoria (*q v.*), characterized by its slipper-like shape, common in infusions, especially when they contain a little animal matter. It has two dorsal contractile vacuoles, each receiving the mouths of five radiating canals from the inner layer of the ectosarc, and a large ovid meganucleus, and one or two micronuclei. From its abundance, the ease with which it can be cultivated and observed, its simple structure and large size ($\frac{1}{125}$ in), it is frequently selected for elementary study and demonstration, as well as for research. *P. bursaria* is green, owing to the presence of symbiotic algae.

PARANÁ, a State of southern Brazil, on the Atlantic coast, with the Paraná river as its western boundary line Area, 77,160 sq.m.; pop. (1920) 685,711. It includes two dissimilar regions—a narrow coastal zone, thickly wooded, swampy, and semi-tropical and a plateau (2,500 to 3,000 ft) whose precipitous, deeply eroded eastern escarpments are known as the Serra do Mar, or Serra do Cubatão. The southern part of the State is densely forested and has large tracts of Paraguay tea (*Ilex paraguayensis*), known in Brazil as *herva maté*, or *matte*. The plateau slopes westward to the Paraná river, is well watered and moderately fertile, and has a remarkably uniform climate of a mild temperate character. The larger rivers of the State comprise the Paranapanema and its tributaries the Cinza and Tibagy, the Ivahy, Piquiry, Jejuy-guassú, and the Iguassú with its principal tributary the Rio Negro. Twenty miles above the mouth of the Iguassú are the Iguassú falls, 215 ft. high. The plateau is undulating and the greater part is adapted to agriculture and pastoral purposes. There are two railway systems in the State—the Paranaguá to Curityba (69 m.) with an extension to Ponta Grossa (118 m.) and branches to Rio Negro (55 m.), Porto Amazonas (6 m.) and Antonina (10 m); and the São Paulo and Rio Grande, which crosses the State from north-east to south-west from Porto União da Victoria, on the Iguassú, to a junction with the Sorocabana line of São Paulo at Itarare. The upper Paraná is navigable between the Guayrá, or Sete Quedas, and the Urubu-punga Falls. The chief export of Paraná is Paraguay tea.

There is a large foreign element in the population owing to immigrant colonies on the uplands, and progress has been made in small farming Besides the capital, which is Curityba, the principal towns (with the population of their municipal districts for 1920) are Paranaguá (18,998); Antonina, at the head of the bay of Paranaguá (10,105); Campo Largo, 20 m W of Curityba (19,149); Castro, north-north-west of the capital on the São Paulo and Rio Grande line (18,949); and Ponta Grossa (20,171), at the junction of the two railway systems of the State

Paraná was settled by gold prospectors from São Paulo and formed part of that captaincy and province down to 1853, when it was made an independent province. The first missions of the Jesuits on the Paraná were situated just above the Guayrá Falls in this State and had reached a highly prosperous condition when the Indian slave hunters of São Paulo (called Mamelucos) compelled them to leave their settlements and emigrate in mass to what is now the Argentine territory of Misiones.

PARANÁ, a city and port of Argentina, capital of the province of Entre Ríos, and the see of a bishopric, situated on the left bank of the Paraná river, 410 m. by navigable channels (about 240 m. direct) N W of Buenos Aires Pop. (1914) 36,089 The city occupies a gently rolling site 120 ft above the river and about 2 m from its riverside port of Bajada Grande, with which it is connected by railway, tramway and highway. It is classed as a seaport, and ocean-going vessels of not over 12 ft draught can ascend to Bajada. There is also a daily ferry service across the river to Santa Fé (7 m. distant), which is connected by railway with Rosario and Buenos Aires. Paraná is also the western terminus of a provincial railway system, which connects with Concepción and Concordia, on the Uruguay river, and with other important towns of the province. The mean annual temperature is about 66° F and the climate is bracing and healthful Its port of Bajada Grande, on the river shore below the bluffs, has the custom-house and a fine wharf for the accommodation of the Entre Ríos railway and river craft. Paraná was founded in 1730 by colonists from Santa Fé and was at first known as Bajada. It was made the capital of the province by Gen. Mansilla in 1821, but in 1861 Gen. Urquiza restored the seat of government to Concepción, where it remained until 1882, when Paraná again became the capital. Paraná was also the capital of the Argentine from 1852 to 1861.

PARANAGUÁ, a seaport of the State of Paraná, Brazil, on the southern shore of the Bay of Paranaguá, about 9 m from the bar of the main channel. Pop. of the municipality (1920) 18,998 Paranaguá is the principal port of the State, and is a port of call for steamers in the coastwise trade It is the coastal terminus of a railway running to Curityba, the capital (69 m.), with an extension to the line that connects São Paulo with Uruguay, and a branch to Antonina, 10½ m W of Paranaguá Its exports consist chiefly of *maté*, or Paraguay tea The town was founded in 1560

The Bay of Paranaguá opens into the Atlantic in lat 25° 32′ S through three channels and extends westward from the bar about 19 miles It is irregular in outline, and comparatively shallow Light-draught steamers can ascend to Antonina at the head of the bay. The broad entrance to the bay, which is the gateway to the State of Paraná, is nearly filled by the large Ilha do Mel (Honey island) an old fort commanding the only practicable channel.

PARAÑAQUE, a municipality (with 7 *barrios* or districts) of the province of Rizal, Luzon, Philippine Islands, on Manila bay about 8 m south of Manila. Pop. (1918), 22,121, of whom 16,851 were males (the great disparity between the sexes arising from the soldiers stationed at Camp Tomás Claudio) It has long been famous for its embroidery. In 1918 it had 43 manufacturing

establishments with output valued at 205,800 pesos. Of the seven schools, five were public. The language spoken is Tagalog.

PARANOIA, a chronic mental disease, of which systematized delusions with or without hallucinations of the senses are the prominent characteristics. The delusions may take the form of ideas of persecution or of grandeur and ambition. The disease may begin during adolescence, but the great majority of the subjects manifest no symptoms of the affection until full adult life.

The prominent and distinguishing symptom of paranoia is the delusion which is gradually organized out of a mass of original but erroneous beliefs or convictions until it forms an integral part of the ordinary mental processes of the subject and becomes fused with his personality. This process is known as "systematization."

It is necessary to point out that there is, undoubtedly, what may be called a paranoiac mental constitution, in which delusions may appear without becoming fixed or in which they may never appear. The characteristics of this type of mind are credulity, a tendency to mysticism and a certain aloofness from reality, combined, as the case may be, with timidity and suspicion, or with vanity and pride. On such a soil, given the necessary circumstances, a systematized delusional insanity may develop.

The term paranoia appears to have been first applied by R. von Krafft-Ebing in 1879 to all forms of systematized delusional insanity. The rapid development of clinical study has now resulted in the isolation of a comparatively small group of diseases to which the term is applied and the relegation of other groups resembling it to their proper categories.

Attempts have been made to base a differential diagnosis of paranoia upon the presence or absence of a morbid emotional element in the mind of the subjects, with the object of referring to the group only such cases as manifest a purely intellectual disorder of mind. Though in some cases of the disease the mental symptoms may, at the time of observation, be of a purely intellectual nature, the further back the history of any case is traced, the greater is the evidence of the influence of preceding emotional disturbances in moulding the intellectual peculiarities. Indeed, it may be said that the fundamental emotions of vanity or pride and of fear or suspicion are the groundwork of the disease. It is frequently ascertained that the patients have always been regarded as "queer."

Paranoia is classified for clinical purposes according to the form of delusion which the patients exhibit. Thus there are the Persecutory, the Litigious, the Ambitious and the Amatory types.

1. **Persecutory Paranoia.**—This form is characterized by delusions of persecution with hallucinations of a painful and distressing character. In predisposed persons there is often observed an anomaly of character dating from early life. The subjects are of a retiring disposition, generally studious, though not brilliant or successful workers. They prefer solitude to the society of their fellows, and are apt to be introspective, self-analytical, or given to unusual modes of thought or literary pursuits. Towards the commencement of the insanity the patients become gloomy, preoccupied and irritable. Suspicions regarding the attitude of others take possession of their minds, and they ultimately come to suspect the conduct of their nearest relatives. The conversations of friends are supposed by the patient to be interlarded with phrases which, on examination, he believes to contain hidden meanings, and the newspapers appear to abound in veiled references to him. A stray word, a look, a gesture, a smile, a cough, a shrug of the shoulders on the part of a stranger are apt to be misinterpreted and brooded over. The extraordinary prevalence of this imagined conspiracy may lead the patient to regard himself as a person of great importance, and may result in the formation of delusions of ambition which may wholly supplant the persecutory insanity.

Hallucinations may begin to appear. These, in the great majority of instances, are auditory, and usually commence with indefinite noises in the ears, such as ringing sounds, hissing or whistling. Gradually they assume a more definite form, until isolated words and ultimately formed sentences are distinctly heard. A not uncommon form of verbal hallucination is formulated in the complaint of the patients that "all their thoughts are read and proclaimed aloud." Though some of the subjects do not develop any other form of hallucination, others suffer from hallucinations of taste, smell or touch. The misinterpretation of subjective sensations in these sense organs leads to the formulation of delusions of poisoning or of being subjected to the influence of noxious gases or powders.

During the course of a disease so distressing in its symptoms the patient's suspicions as to the authors of his persecution vary much in indefiniteness. He often never fixes the direct blame upon any individual, but refers to his persecutors as "they" or a "society," or some corporate body such as "lawyers," "priests" or "freemasons." It not infrequently happens that suspicions gradually converge upon some individual, or that from an early stage of the disease the patient has fixed the origin of his trouble upon one or two persons. When this takes place the matter is always serious from the point of view of physical danger to the inculpated person.

The persecutory type of the disease may persist for an indefinite period—even for 20 or 30 years—without any change except for the important fact that remissions in the intensity of the symptoms occur from time to time. These remissions may be so marked as to give rise to the belief that the patient has recovered, but in true paranoia this is hardly ever the case.

2. **Ambitious Paranoia.**—After a long period of persecution a change in the symptoms may set in, in some cases, and the intensity of the hallucinations may become modified. At the same time delusions of grandeur begin to appear, at first faintly, but gradually they increase in force until they ultimately supplant the delusions of persecution. At the same time the hallucinations of a disagreeable nature fade away and are replaced by auditory hallucinations conformable to the new delusions of grandeur.

The emotional basis of ambitious paranoia is pride, and every phase of human vanity and aspiration is represented in the delusions of the patients. There is, moreover, considerably less logical acumen displayed in the explanations of their beliefs by such patients than in the case of the subjects of persecution. Many of them affect to be the descendants of historical personages without any regard for accurate genealogical detail. They have no compunction in disowning their natural parents or explaining that they have been "changed in their cradles," in order to account for the fact that they are of exalted or even of royal birth. The sphere of religion affords an endless field for the ambitious paranoiacs, and some of them may even aspire to Divine authority.

A not uncommon form of paranoia, combining both ambition and persecution, is where the subject believes that he is a man of unbounded wealth or power, of the rights to which he is, however, deprived by the machinations of his enemies. They are often so troublesome, threatening and persistent in their determination to obtain redress for their imagined wrongs, that they have to be forcibly detained in asylums in the public interest.

On the whole, however, the ambitious paranoiac is not troublesome, but calm, dignified, self-possessed, and reserved on the subject of his delusions. He is usually capable of reasoning as correctly and of performing work as efficiently as ordinary people.

3. **Amatory Paranoia.**—A distinguishing feature of this form of paranoia is that the subjects are chivalrous and idealistic in their love. Some of them believe that they have been "mystically" married to a person of the opposite sex, usually in a prominent social position. The fact that they may have never spoken to or, perhaps, never seen the person in question is immaterial. The conviction that their love is reciprocated and the relationship understood by the other party is unshakeable, and is usually based upon suppositions that to a normal mind would appear either trivial or wholly unreal. The object of affection, if not mythical or of too exalted a position to be approached, is not infrequently persecuted by the admirer, who takes every opportunity of obtruding the evidences of an ardent adoration.

Closely allied, if not identical with, amatory paranoia, is the form in which jealousy forms the basis of morbid suspicions with or without definite delusions. The subjects are extraordinarily assiduous in watching the objects of their jealousy.

Their conduct is fertile in producing domestic unhappiness, and in the case of unmarried persons in creating complicated or delicate situations.

4. **Litigious Paranoia** (*paranoia querulans*).—The clinical form of litigious paranoia presents uniform characteristic features which are recognized in every civilized community. It is important to observe that the rights such people lay claim to, or the wrongs they complain of, may not necessarily be imaginary. But, whether imaginary or real, the statement of their case is always made to rest upon some foundation of fact, and is, moreover, presented, if not with ability, at any rate with forensic skill and plausibility. As the litigants are persons of one idea, and only capable of seeing one side of the case—their own—and as they are actuated by convictions which preclude feelings of delicacy or diffidence, they ultimately succeed in obtaining a hearing in a court of law under circumstances which would have discouraged any normal individual. Neither the loss of the case nor the payment of heavy expenses has any effect in disheartening the litigant, who carries his suit from court to court until the methods of legal appeal are exhausted. After dissipating his means and, perhaps, those of his family, and finding himself unable to continue to litigate to the same advantage as formerly, delusions of persecution begin to establish themselves. He accuses the judges of corruption, the lawyers of being in the pay of his enemies, and imagines a conspiracy to prevent him from obtaining justice.

Paranoia is generally a hopeless affection from the point of view of recovery. From what has been stated regarding its genesis and slow development it is apparent that no form of ordinary medical treatment can be of the least avail in modifying its symptoms The best that can be done in the interests of the patients is to place them in surroundings where they can be shielded from influences which aggravate their delusions and to make their lot as pleasant and as easy to endure as possible.

As has been frequently stated, the subjects of most forms of paranoia are liable to commit crime, usually of violence, which may lead to their being tried for assault or murder The question of their responsibility before the law is therefore one of the first importance (*see* also INSANITY: *Law*) The famous case of McNaghten, tried in 1843 for the murder of Drummond, private secretary to Sir Robert Peel, is, in this connection, highly important, for McNaghten was a typical paranoiac and his case formed the basis of the famous deliverance of the judges in the House of Lords in the same year, on the general question of criminal responsibility in insanity in which it was held that such an offender might be regarded as sane, save on one subject, and should, therefore, be held accountable for his acts—a conclusion quite at variance with that of modern medical science

The true paranoiac is a person of an anomalous mental constitution apart from his insanity; although he may, to outward appearances, be able, on occasion, to converse or to act rationally, the moment he is dominated by his delusions he becomes, not partially, but wholly insane; when, in addition, his mind is distracted by ideas of persecution or hallucinations, or both, he becomes potentially capable of committing crime, not because of any inherent vicious propensity but in virtue of his insanity. There is, therefore, no middle course in respect to the criminal responsibility of paranoiacs; they are all insane wholly, not partially, and should only be dealt with as persons of unsound mind

PARANTHELIA, an image in the parhelic circle situated from 90° to 140° of parhelic arc from the sun. *See* also HALO

PARAPET, a dwarf wall or heavy railing around the edge of a roof, balcony, terrace, stairway, etc., either to prevent those behind it from falling over, or to shelter them from attack from the outside. Thus battlements (*q.v.*) are merely one form of defensive parapet arranged to allow those within to discharge missiles without exposing themselves. In many cases roof and terrace parapets are only continuations of the wall below, but in some instances they are projected forward beyond the face of the wall and carried upon brackets or a moulded cornice Parapets, during the classic ages, were often formed of large slabs of marble pierced with holes, forming a pattern of squares and diagonals; an example still exists in the ruins of the palace of Tiberius on the Palatine hill at Rome. Parapets with fish-scale patterns were also used and are indicated in extant wall paintings in Pompeii. English late Gothic parapets frequently adopt the battlement form During the Renaissance, the use of the balustrade largely superseded the parapet, but in north Europe, the transitional early Renaissance styles offer many examples of fantastically scrolled and pierced parapets

PARASELENAE or **MOCK MOON,** a bright spot on a lunar halo resembling the moon A number of these reflections of the moon appear at the intersection of the inner halo and the parhelic circle. *See* also HALO.

PARASITIC DISEASES. It has long been recognized that various specific pathological conditions are due to the presence and action of parasites (*see* PARASITISM) in the human body, and during the last 50 years the part played in the causation of the so-called infective diseases by various members of the schizomycetes or fission fungi has been widely and thoroughly investigated. During the past 20 years many diseases have been ascribed to filter passing viruses. Below are given lists of the principal morbid conditions ascribed to these two groups of causes:

A.—Morbid conditions affecting man due to vegetable parasites: Suppuration, septicaemia, infective endocarditis, erysipelas, gonorrhoea, soft chancre, nasal catarrh, pneumonia, acute rheumatism (?), cholera, typhoid fever, paratyphoid fevers, epidemic diarrhoea, bacillary dysentery, malta fever, plague, diphtheria, tetanus, anthrax, influenza (?), tuberculosis, glanders, leprosy, epidemic cerebro-spinal meningitis, dental caries, tularaemia, actinomycosis and other streptothricoses, aspergillosis, favus and other skin diseases, whooping cough

B.—Morbid conditions affecting man due to filter-passing viruses. yellow fever, rabies, vaccinia, variola, dengue, sandfly fever, trachoma, poliomyelitis, measles (?), typhus fever, trench fever, mumps (?), herpes labialis, influenza (?), common colds

Discussion of the general relation of vegetable parasites to disease is contained in articles on BACTERIA; IMMUNITY; VACCINE THERAPY; and of filter-passing viruses in FILTER-PASSING VIRUSES In this article the part played by protozoal and other animal causes of disease is considered

MORBID CONDITIONS DUE TO ANIMAL PARASITES

Introductory.—Animal parasites are invertebrate animals which have abandoned their free-range life and have taken up their abode in or upon the living bodies of other animals or plants Freedom has been exchanged for a more constant and usually richer supply of food and a greater measure of protection

The term "parasite" connotes habitat rather than zoological grouping (*see* PARASITISM; PARASITOLOGY). Several of the main subdivisions of the animal kingdom contain both free-living and parasitic forms but with the specialised parasitic method of living certain physiological and morphological adaptations have often resulted which have rendered a free existence no longer possible. All gradations exist from the raiders which are parasitic only

which cannot now survive if separated from their "host." Many forms which as adults are obligatory parasites still have a free-living larval phase in an invertebrate during the free larval development. The animal in which the adult stage of a parasite is attained is termed the "definitive host." That in which an immature or "larval" stage develops is called the "intermediate host." Some parasites have no free stage or intermediate host. Some have a free stage without intermediate host and others have two successive intermediate hosts through which they must pass before reaching adult life in the definitive host. A knowledge of these developmental phases is obviously of great importance in preventive medicine, for the control of a disease in a community may be attained more readily by destroying the essential intermediate hosts than by stamping out the disease in the members of the community. Climatic conditions limit the spread of parasites by acting upon the free-living stages, *e.g.*, hookworm development is controlled by temperature and only occurs in warm climates. The effect may be indirect by action upon the intermediate host.

The vast majority of internal parasites inhabit the alimentary canal or ducts leading thereto. This indicates probably the original as well as the present route of invasion of most parasites. Oral infection is from food, seldom from water. But in a few striking cases infection enters not by the mouth but by penetrating the skin, as in Bilharziasis (*q.v.*). In some instances penetration follows injection by some insect which has previously sucked up an earlier stage of larval development from another animal.

Animal parasites belong either to the unicellular Protozoa or to the multicellular (metazoan) invertebrates. Protozoan parasites can multiply in their definitive hosts and produce enormous numbers but in the metazoan parasites successive generations do not follow the attainment of sexual maturity in the definitive host. Here the progeny (eggs or embryos) must leave the host body and undergo some part of their larval development outside, or in an intermediate host, before the infective stage is reached when the definitive host can again be parasitized. As the majority of the Metazoa live in the gut, the eggs appear most frequently in the bowel discharges. Microscopical examination of the stools has become therefore an important routine in the detection of infection with animal parasites. Intestinal infections with protozoal forms can be diagnosed similarly from the passage of free or encysted stages of these organisms.

Animal parasites affect their hosts by absorbing nourishment, by feeding upon the living tissues or cells, by mechanical injury or obstruction, and by the poisonous effect of their excretions and secretions. Different species affect their hosts in varying degree. In some cases the effect is so slight that the parasite appears to be almost a commensal. Parasitism differs from commensalism in that the host does not benefit, in turn, from the presence of the parasite. But it should be noted that it is not in the interests of a parasite that great harm should result to the host from its presence. A certain amount of tolerance, *i.e.*, of acquired immunity, develops in the host.

Within the definitive host the normal habitat of each parasite is usually strictly limited to some special organ or tissue. The malaria parasites for instance invade the red blood corpuscles. The trypanosomes live in the fluid of the blood. Some species of fluke live in the gut, others in the bile ducts (Plate fig. 10) and others again in the lung (Plate fig. 11). Adult tape worms almost without exception are inhabitants of the gut while in their larval stages they infest the solid tissues of the body. Round worms are mainly intestinal in habitat but some live in the tissues, producing tumours, others in the lymphatic and haemal systems, while one of the largest invades the kidney. (Plate fig. 7.)

PARASITIC PROTOZOA

The Protozoa (*q.v.*) are classified in four main groups based on the method of locomotion adopted by the organism. The first group, Sarcodina, move by means of pseudopodia, or extrusions of the body-wall, towards and into which the remainder of the body flows, e.g., *Amoeba*. The second group, the Flagellata, which possess a more definite body-shape, move by means of one or more long, very slender lash-like organs, which, by their rapid movement, drag the body through the surrounding medium, e.g., Trypanosomes. Thirdly the Ciliata possess a fur-like coating of short, very fine out-growths, the cilia, which, by their rhythmical wave-like motion, propel the body. The fourth group, the Sporozoa, form a heterogeneous group of organisms, all of which are parasitic. The adult stages possess no means of locomotion and they reproduce by spore-formation. In many of the Sporozoa the developmental forms have some power of movement, which may be effected by pseudopodia or by flagella, indication that the loss of movement is due to the parasitic mode of life.

This form of classification is beset with many difficulties, as, for example, that some of the Protozoa adopt different means of locomotion at different periods of their existence. Owing to the diversity present in the group and in the primary divisions or classes, numerous subdivisions have been formed within each class.

Protozoa of the Alimentary Canal.—The pathogenic Protozoa inhabiting the alimentary canal of man and other vertebrates include representatives of all four groups. Of the Sarcodina *Entamoeba histolytica,* the causative organism of amoebic dysentery is the most important. Infection is caused by the ingestion of faeces containing cysts of the amoeba. These hatch and liberate the amoebae into the intestine where they penetrate the walls, breaking down and consuming the tissue, and cause ulcers. Occasionally they may be carried in the blood-stream to the brain or liver, causing the formation of abscesses. Some of the amoebae round up, secrete a resistant wall and pass out of the body in the faeces, ready, if reingested, to create a new infection. *Entamoeba gingivalis* is parasitic in the human mouth and has been associated with tonsilitis and pyorrhoea but is probably entirely harmless. Cysts are not known but the mode of transmission is probably contaminative.

Of the intestinal Flagellata only one species appears to be pathogenic. *Giardia intestinalis,* frequently associated with diarrhoea, is an eight-flagellated organism, which is also provided with a large sucker by which it clings to the intestinal epithelium. It passes out of the body in the form of cysts and is transmitted by the contamination of food with faeces.

The only ciliate pathogenic to man is *Balantidium coli,* which, like *Entamoeba histolytica,* penetrates the walls of the intestine causing ulceration and giving rise to dysenteric conditions. This form also produces cysts which are passed out of the intestine.

The most important sporozoan parasites of the alimentary canal of vertebrates are the Coccidia. These form a widely distributed group of parasites which attack almost all mammals and many of the lower vertebrates and invertebrates. Most species cause denudation of the intestinal epithelium, while a few invade the epithelium of the bile-ducts causing functional disturbance of the liver. Only one species, *Isospora hominis,* is parasitic in man, and this has a very limited distribution and is not of great pathogenicity. *Eimeria zurnii* is the cause of epidemics of red dysentery in cattle. *E. faurei* and *E. arloingi* infect sheep and goats respectively. Dogs and cats harbour other species of *Eimeria* and the allied genus *Isospora.* Two species of *Eimeria* infect the rabbit. Poultry and game birds are also attacked.

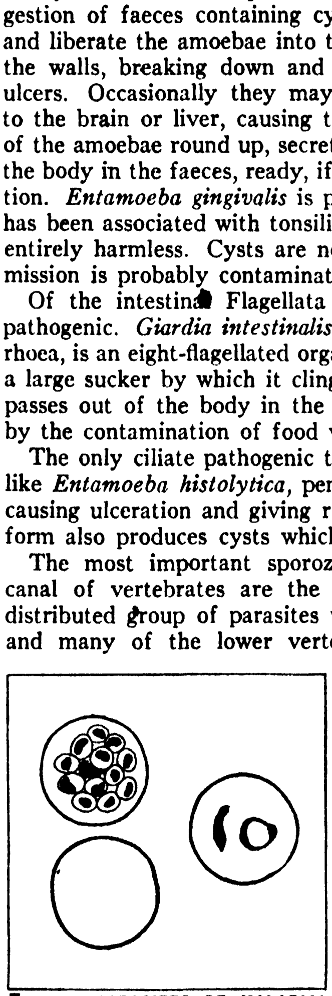

FIG. 1.—PARASITES OF MALARIAL FEVER IN PERIPHERAL BLOOD

The parasites are transmitted by resistant stages, the oocysts. These when mature contain sporozoites which hatch out on entering the intestine and make their way into the epithelial cells or travel up the bile-duct. Within the cells they multiply rapidly by an asexual process, producing merozoites. At the same time sexual forms are developed, the females after fertilization being passed out of the body in the form of resistant oocysts. Outside the body development proceeds, resulting in the formation of sporozoites within the oocysts. When this development is completed the oocysts are infective if ingested by a new host.

Protozoa Inhabiting the Blood and Tissues.—These are both numerous and important. Only a few can be dealt with.

Malaria.—Plasmodium, the causative organism of malaria (*q.v.*), is represented by three species parasitic in man. Several other varieties are known to attack other mammals. The parasites live in the red blood corpuscles, where they grow, form a pigment, and finally divide up into a number of small bodies which are liberated by the breaking down of the containing corpuscle. These small bodies, the merozoites, then penetrate other blood-corpuscles and again grow and divide, thus repeating the asexual cycle indefinitely. Since each cycle takes a definite time for its completion, the pigment formed by the parasite is liberated into the blood at regular intervals, and by its toxic action fever is set up. Some of the merozoites develop into sexual forms which circulate in the bloodstream without further development until they are ingested by a female anopheline mosquito. Fusion of the sexual elements takes place in the stomach of the mosquito and the resultant organism passes into the body-cavity where it forms a cyst. Within this cyst numerous small, spore-like bodies (sporozoites) develop. These make their way into the salivary glands of the mosquito, and, at the next feed are injected into the wound creating a fresh infection. The three species of *Plasmodium* causing human malaria are distinguishable by microscopic examination in all their stages. Further, while *P. vivax* and *P. falciparum* complete the asexual cycle in 48 hours, causing tertian fever, *i.e*, fever recurring every third day, *P. malariae* develops more slowly and produces quartan fever, *i e.*, fever recurring every fourth day.

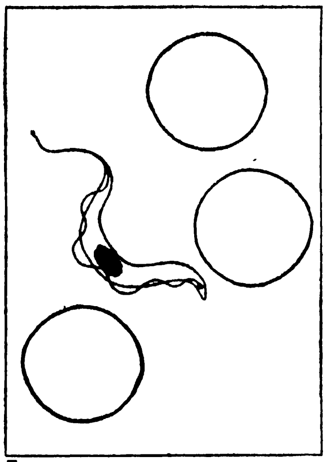

FIG 2 —PARASITE OF SLEEPING SICKNESS IN PERIPHERAL BLOOD

Trypanosomes and Sleeping Sickness.—Trypanosomes, the causative organisms of sleeping sickness (*q.v*) in man and similar diseases in cattle and game in Africa, are flagellate parasites which inhabit chiefly the liquid portion of the blood. They consist of an elongated, flattened, binucleate body, one edge of which forms an undulating membrane, the outer margin of which is supported by a flagellum which either becomes free at the anterior end or terminates with the membrane.

The life-cycle is passed partly in the mammalian host and partly in the gut of a blood-sucking insect, the transmittor. In African sleeping sickness the trypanosome, *T. gambiense* or *T. brucei,* is injected into the blood-stream of the definitive host, where it multiplies with great rapidity, by the bite of a tse-tse fly. Some of the trypanosomes eventually make their way into the cerebro-spinal fluid, where they produce the symptoms of the disease The ingested trypanosomes pass into the mid-gut of the fly where multiplication takes place and the resulting flagellates, the infective forms, pass forward into the salivary glands from which they are ejected at the next feed to recommence the cycle in the definitive host. Other species of African trypanosomes differ slightly in their life cycle and mode of transmission

Chagas's disease, prevalent among children in South America, is transmitted by certain bugs, the faeces of which are infective when rubbed under the skin. The trypanosomes multiply in the tissues of the body where non-flagellate stages occur.

Leishmania Donovani and Leishmania Tropica.—Kála-ázar, a disease widely distributed in India, China, Russia, Africa and the Mediterranean littoral, is caused by a flagellate parasite, *Leishmania donovani,* which has recently been shown to be transmitted by a species of sand-fly. The disease attacks chiefly children and young adults and is caused by the parasites invading the cells constituting the walls of the capillary blood-vessels in the bone-marrow and glands of the body. The parasite as seen in the definitive host is a minute, rounded, non-flagellate body, containing two nuclei which differ from one another in form, one being rod-shaped, the other rounded. These bodies multiply by fission within the host-cells which become packed with parasites. The organisms then escape and enter other cells in which reproduction is continued. Many find their way into the white blood corpuscles and circulate in the peripheral blood, with which they are taken up by bloodsucking insects In the sand-fly they become flagellated. The body elongates and a single long flagellum, arising from the neighbourhood of the rod-shaped nucleus, extends anteriorly, free of the body. Within the intestine and pharynx these flagellates reproduce by longitudinal fission and give rise to forms infective to man

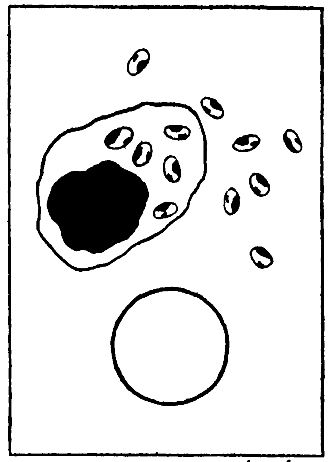

FIG. 3.—PARASITE OF KÁLA-ÁZAR IN SPLEEN SMEAR

L. tropica, while being morphologically identical with *L. donovani,* produces an infection that is limited to the skin and the mucosa of the nose, throat and mouth, where it produces ulcerating sores. This parasite occurs in the New as well as the Old World It also is probably transmitted by a species of sand-fly.

The Spirochaetes —The spirochaetes are microscopic organisms with slender, thread-like, spirally twisted bodies. Movement is effected by wave-like motions of the flexible body, often accompanied by rotation. Their inclusion among the Protozoa is of doubtful validity, for, although they exhibit some protozoal characters, they seem more closely allied to the Bacteria

Spirochaetes occur in the intestines and blood of man and most domestic animals In the latter they are usually non-pathogenic, but in man, when they invade the blood-stream and internal organs, they give rise to various diseases *Treponema recurrentis,* the parasite of relapsing fever (*q v.*), prevalent in Africa, Asia and America, is transmitted by lice and ticks to the human bloodstream *Treponema pallidum,* the causative organism of syphilis (*see* VENEREAL DISEASES), is a tissue parasite, as also are the spirochaetes associated with yaws and acute infective jaundice The latter is thought to be transmitted by water contaminated by the urine of naturally infected rats Rat-bite fever, a disease following the bite of rats, or other small mammals, is due to an organism, *Spirillum minus,* which occurs in the mouths of these animals

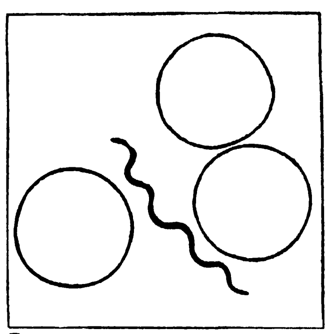

FIG. 4.—PARASITE OF RELAPSING FEVER IN PERIPHERAL BLOOD

PARASITIC METAZOA

If we omit the insects which as occasional raiders for food act unwittingly as vectors of animal parasites (*see* ENTOMOLOGY, MEDICAL) and other arthropods, which are more permanent parasites of the skin, inducing irritation diseases such as pediculosis and scabies, the chief metazoan parasites are those commonly termed "parasitic worms." It should be noted, however, that the term "worm" is used very loosely for a large variety of animals which are, zoologically, unrelated: the "blind-worm" or "slow-worm," "glow-worm," "round-worm," "wire-worm," "tape-worm" and "earth-worm" belong to different subdivisions of the animal kingdom The parasitic worms found in animals belong either to the phylum Nemathelminthes or to the phylum Platyhelminthes (*qq.v.*).

Nemathelmia.—The phylum Nemathelmia (round-worms) contains three classes:—(*a*) Nematoda (*q v*) (round-worms with a well developed gut), (*b*) Nematomorpha (*q v*) (round-worms

with gut which atrophies in the adult) and (*c*) Acanthocephala (*q.v.*, thorn-headed round-worms in which the gut is entirely absent). Of these the class Nematomorpha contains relatively unimportant forms which parasitise arthropods. The Acanthocephala are mainly intestinal parasites of birds and fishes. A few species infest mammals.

Nematodes and Disease.—The class Nematoda is, however, by far the most important division of the Nemathelmia. It contains many thousand species of which a considerable proportion are free-living in the soil and decaying organic matter. Specialized species are found in malt vinegar and paper-hangers' paste. All these forms are of microscopic size. Closely allied to them is a small group which is parasitic in many cultivated plants (Plate, fig. 4), *e.g.*, potato, tomato, clover, wheat, oats, tulip, onion, etc., and cause considerable economic losses in Great Britain. On the European continent the sugar-beet is severely attacked, while in the Tropics coffee, bananas, oranges, rice and tobacco are frequently infested by allied "nemas" or "eel-worms."

Nematodes occur in practically all vertebrate animals. These round-worms are usually of larger size than those found free-living or in the cultivated plants and may attain a length of two to three feet, *e.g.*, *Dracunculus medinensis*, the Guinea worm (*q.v.*). The nematodes are unisexual, *i.e.*, there are separate males and females. The eggs are simple and such yolk as may be present is incorporated as globules in the protoplasm of the ovum. Larval development in the various species is essentially the same and proceeds by a series of metamorphoses marked by ecdyses. Some of these changes occur during the period of delay outside the body after the passage of the egg or embryo from the definitive host. The remainder occur after reinfection. In some cases the extra-corporeal phase is undergone within the thick egg-shell as in the round-worms of dogs, cats, pigs and man. Infection results from the swallowing of these embryonated eggs as contaminations of food. In numerous other cases, however, as in the large group of so-called "bursate" nematodes (which include the hookworm of man and the red-worms of horses) the egg-shell is thin and the developing embryo emerges therefrom. After a short period outside the body, the hatched worm undergoes its further metamorphosis into the infective stage as a microscopical form in the soil, to re-enter its host later by the mouth. In a few instances reinfection of the definitive host is accomplished by the penetration of the skin as in hookworm disease (*q.v.*).

In a third group of nematodes, viz., those which live in the tissues of the body and are commonly called filarial worms, the embryos are discharged into the lymph or blood and are sucked up by biting insects. In the bodies of these insects the same essential metamorphosis takes place and the infection subsequently re-enters another definitive host through insect bites.

In a fourth group larval development takes place in an intermediate host eaten by the definitive host, *e.g.*, *Trichinosis* (*q.v.*).

After gaining entry into the definitive host either by the mouth or through the skin, the larval nematodes in some cases, not in all, undergo strange migrations through the blood stream to reach their final habitat and during the course of these wanderings they may give rise to serious damage. Heavy losses are incurred in young pigs as result of pneumonia set up by the migration through the lungs of the young stages of the common round-worm *Ascaris suilla*. There is a similar migration on the part of young hookworms *en route* from the skin to the bowel, but there is relatively less damage as the number passing at a time is usually small and the associated symptoms are merely a transient cough. Similarly urticarial irritation is induced when large numbers of hookworm larvae penetrate the skin at the same time.

For detailed technical information concerning the morphology and classification of the parasitic nematodes reference should be made to the well illustrated volume by Warrington Yorke, *The Nematode Parasites of Vertebrates.* Mention can only be made here of a few forms which are associated with disease in man and the lower animals. One of the most interesting of these is the *Filaria bancrofti*, a delicate thread-like worm which lives in the lymphatic vessels and is reputed to be the cause of a number of different diseases in man which have been grouped together under the term filariasis (*q.v.*). Some of these diseases are due to the damage done by the worm to the lymphatic wall, others are attributable to secondary invasion of these damaged lymphatics by streptococcic germs. The young of this parasite appear in large numbers in the peripheral blood stream at night and disappear during the day time. Manson showed that this rhythmic appearance was associated with the habits of the intermediate host—a night-biting mosquito—*culex fatigans*, in the thoracic muscles of which the essential larval development takes place. An allied filarial worm *Dirofilaria immitis* inhabits the right side of the heart of the dog (Plate, fig. 8). This parasite is especially common in China but occurs also in Italy and South America and is spread by a mosquito. In natives of West Africa worms frequently cause conjunctivitis. They belong to the species *Loa loa* and are transmitted from man to man by a day-biting insect of the genus *Chrysops.* In this case the young worms appear periodically in the blood, but during the day only, in strange compliance with the day-biting habits of the insect vector. Closely allied to the filarial worms are the nodule worms of the genus *Onchocerca.* These worms produce tumours sometimes of the size of a walnut in the tendinous attachments of muscles. Such tumours are common in man in certain parts of tropical Africa, especially in the Congo. The young of these worms congregate in the deeper layers of the skin whence they are sucked up by midges of the genus *Simulium.*

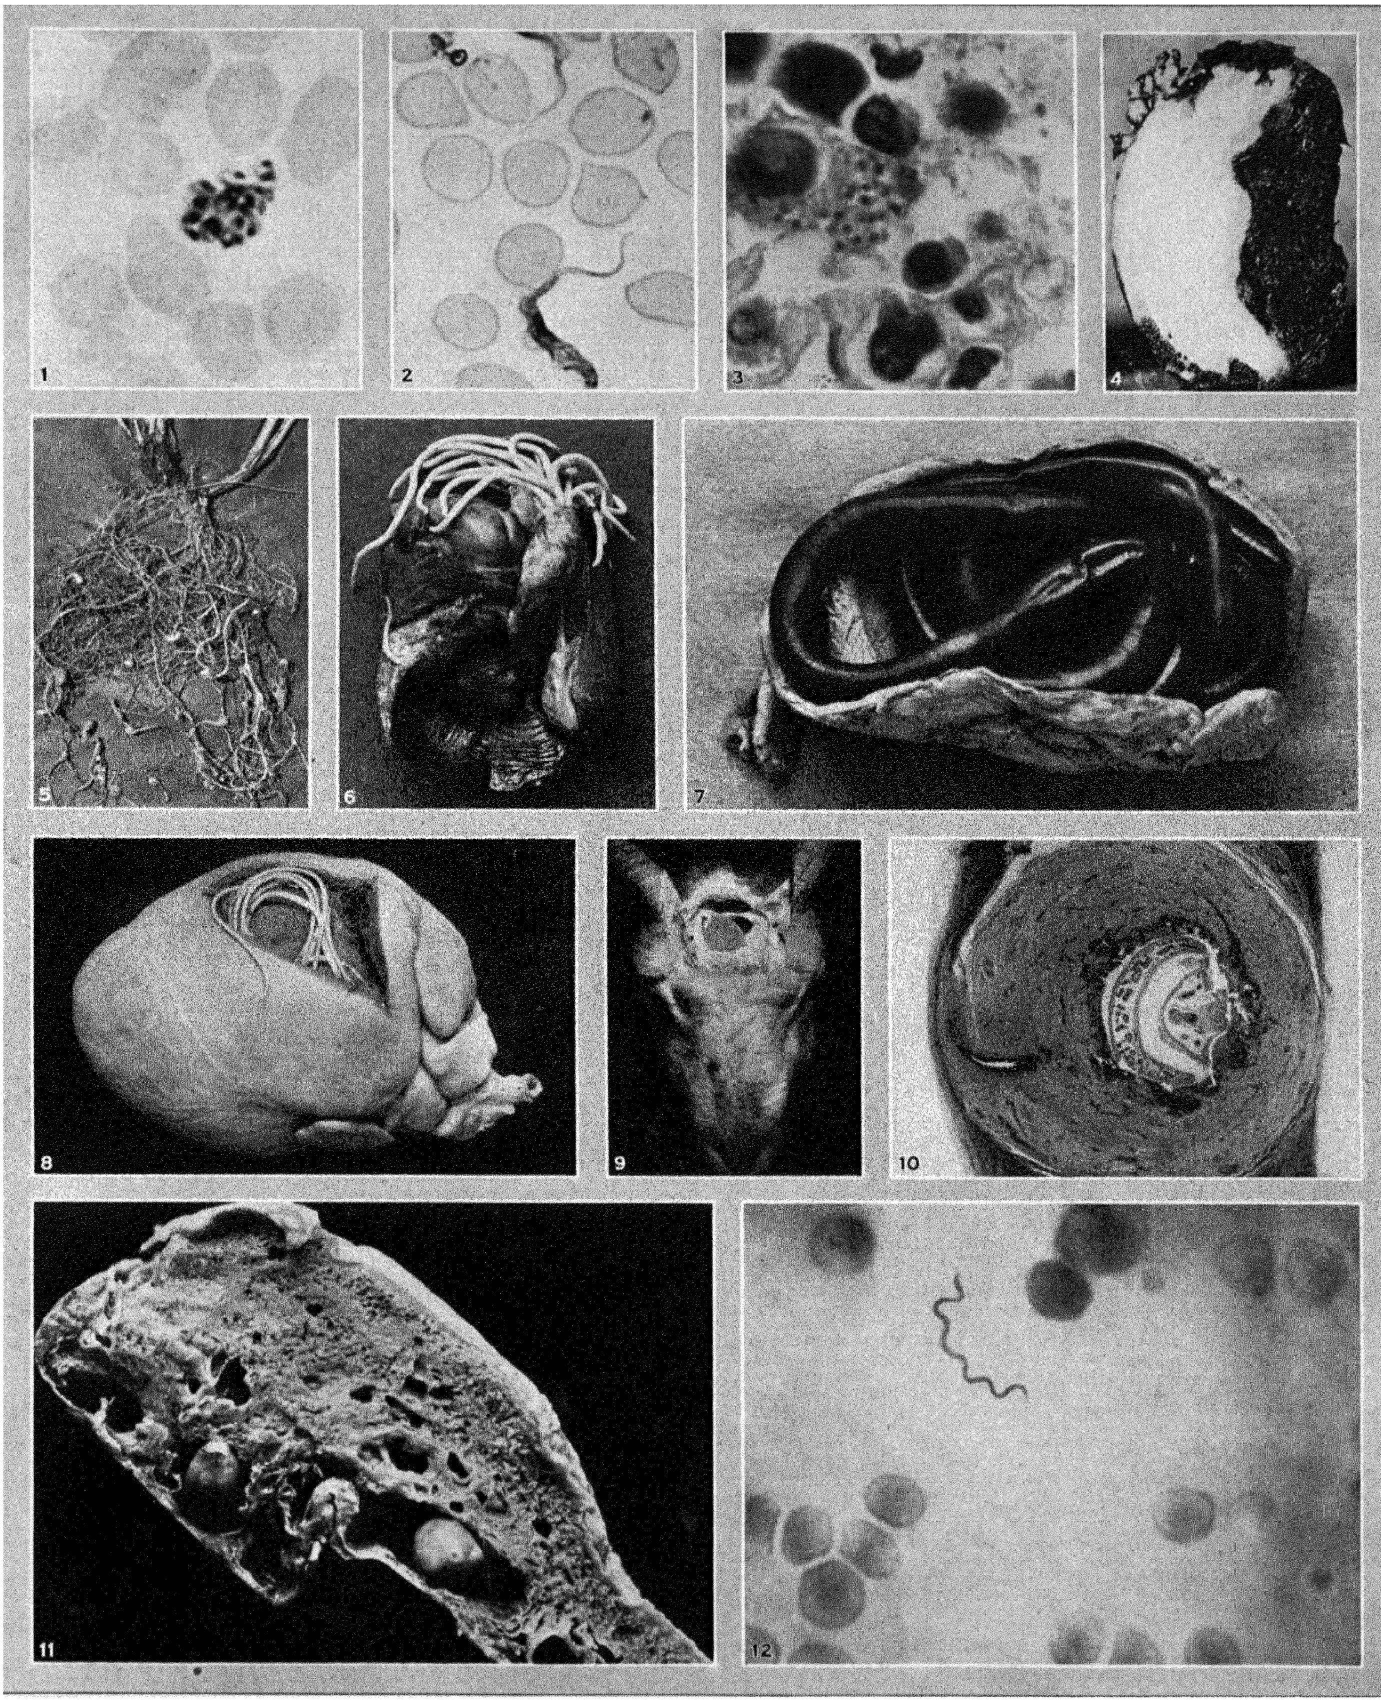
The hookworms of man, of which there are two species, are relatively short nematodes measuring about half an inch in length. They inhabit the small intestine, usually the jejunum, and attach themselves by means of teeth or cutting oral plates. The bites of these worms result in a considerable loss of blood and when numerous worms are present anaemia may result. It has been estimated that 90% of the inhabitants in many tropical countries are infested by hookworm. Many of these, however, show few symptoms of disease owing to an acquired tolerance. Related to the hookworm is the gape-worm of poultry. *Syngamus trachealis* lives, as its name indicates, in the wind-pipe. It is a common cause of death in young chickens and pheasants, partly through the obstruction of the air passage, partly from the abstraction of blood upon which the worms feed. Adult birds practically never harbour the worms. Turkeys and starlings are frequently infected by this parasite without suffering to any extent. It is suspected that they are the chief reservoirs of the infection.

Many different species of round-worms, somewhat more distantly related to the hookworm, live in the gut and lungs of sheep, goats, cattle and horses. Many of these probably do little harm but the results of massive infection with several species show themselves in general loss of condition and of body weight and in increased susceptibility to bacterial disease.

Platyhelmia.—The Platyhelmia (or flat-worms) contain three classes:—(*a*) Turbellaria (*q.v.*), *i.e.*, planarians; usually free living forms but a few species are parasitic in molluscs. (*b*) Trematoda (*q.v.*), or flukes, parasitic in or upon vertebrates, and (*c*) Cestoda (tape-worms, *q.v.*), parasitic in vertebrates.

The Platyhelmia are hermaphrodite, are leaf-like or pear shaped, and, in the case of the Cestoda, tape-like in outline. Turbellaria are distinguished morphologically by the presence of numerous cilia on the surface of the body. They probably provided the ancestor of the trematodes, but are otherwise of little interest in relation to animal parasites and disease. A few parasitize molluscs. The Trematoda and Cestoda are covered with a cuticular skin which may or may not be clothed with spines of similar material. The Trematoda are distinguished morphologically from the Cestoda by the presence of a gut which ends blindly. The Cestoda have derived from the Trematoda and may be regarded as a degenerate branch.

Trematoda and Disease.—The trematodes generally inhabit the alimentary canal. A few forms occur in the bile ducts and in some of the birds an occasional species has adapted itself to live in the conjunctival sac and the generative passages. The highly specialized group of flukes to which the bilharzial worms belong live in the blood stream. Other small groups inhabit the mouth, lung and air passages. The flukes give rise to composite eggs containing within the shell masses of yolk-cells in addition to the ovum.



EXAMPLES OF PARASITES OCCURRING IN ANIMALS AND VEGETABLES

1. Tertian malaria rosette in peripheral blood. 2. Causative organism of sleeping sickness (*Trypanosoma gambreuse*) shown in peripheral blood. 3. Kala-azar spleen smear showing the parasite *Leishmania donovani* which causes the disease characterized by enlargement of the spleen, anemia and leukopenia. 4. Potato showing rot associated with eelworm. 5. Root-knot due to eelworm. 6. Gall bladder of a pig showing Ascaris parasite. 7. A round worm (*Eustrongylus gigas*) in a kidney. 8. Heart of a dog showing invasion of *Dirofilaria immitis*. 9. Tape worm cyst (*Coenurus cerebralius*) in head of a sheep. 10. Section of liver of a sheep showing liver flukes, a classification of flat worms. 11. Section of lung of tiger showing Asiatic fluke (*Paragonimus westermanni*). 12. *Spirochaeta duttoni*, organism causing relapsing fever

The vast majority of flukes, including all those of medical importance, require for their larval development a mollusc as intermediate host. The egg, when discharged from the definitive host, usually takes several days or weeks in water to hatch. A ciliated larva emerges which proceeds to its further development by attacking a specific mollusc. Within this mollusc, larval development proceeds. By asexual multiplication large numbers of infective larvae, technically called cercariae, are produced. These cercariae are discharged from the mollusc into water whence they reach the definitive host either (*a*) by direct penetration of the skin, as in the case of *Bilharzia,* (*b*) by encystment on plants which are edible, as in the case of the liver fluke of the sheep, or (*c*) by penetration and subsequent encystment in edible fishes, in crabs, or in mosquito or other insect larvae, or in other molluscs.

For a discussion of the intricacies of trematode morphology and classification the reader should refer to the recent monograph by Poche, *Das System der Platoden* and to the somewhat earlier writings of Looss and Odhner. Of greatest economic importance is *Fasciola hepatica* which infects the bile-ducts of sheep, cattle, horses and rabbits. The presence of these parasites causes marked thickening of the walls of the bile-ducts and subsequent hepatic insufficiency. In tropical countries the lining of the intestinal wall of sheep, cattle, horses and elephants is frequently eroded by vast numbers of clinging amphistome flukes. A third group calling for specific reference here is that of the schistosomes or bilharzia worms (*see* BILHARZIOSIS). Unlike most flukes these are unisexual and live in the portal system. The eggs are laid by the female in its finer ramifications on the walls of the lower bowel and bladder through which they ultimately work their way to be discharged in faeces and urine. *Bilharzia,* various species of which parasitize man, dog, sheep, cattle, goats and camels, develop like other flukes in molluscan intermediary hosts. The infective young or cercariae invade man and other definitive hosts by piercing the skin. Preventive measures against fluke diseases are of two kinds: (*a*) the adult flukes in the definitive hosts and the mollusc carriers of the larval stages can be destroyed by appropriate chemicals. (*b*) Infection can be avoided by the heat sterilization of food containing encysted forms and by avoidance of exposure of the skin to infected water.

Tapeworms and Disease.—Tapeworms infest all classes of vertebrates but the number occurring in reptiles and amphibians is relatively low. Excellent monographs on the cestodes of mammals have recently been published by Meggitt and Jean Baer and on cestodes of birds by Fuhrmann and Ransom. Southwell and Linton have given special attention to the parasites of fishes.

Adult tapeworms normally inhabit the bowel. In sheep, however, there is a species which lives in the bile ducts. Considering their size, these parasites produce relatively little serious harm. Their presence causes considerable local irritation and diarrhoea. Large numbers may produce obstruction and intussusception (*see* INTESTINAL OBSTRUCTION) in young animals. Owing to the amount of the nourishment they absorb, their presence is associated with abnormal appetite on the part of the host.

Perhaps the most widespread and dangerous form is the small *Taenia echinococcus,* only a quarter of an inch long, which lives as an adult parasite in the small intestine of the dog. Its importance lies in the dangerous character of its larval development. This may occur in a very large number of mammals including man, sheep and cattle. The eggs are passed in the dog's faeces. When swallowed by the intermediate host they grow into cysts varying in size from a tangerine to a football. Within these cysts thousands of infective forms develop. When eaten by a dog these infective young attain sexual maturity. Echinococcal cysts usually develop in the liver, lung or spleen and cause considerable pressure atrophy of the tissues. Escape of fluid from ruptured cysts causes severe shock. Two other tapeworms of interest are *Taenia solium* and *T. saginata.* The larva of the former develops as a cyst in the muscles of the pig while that of the latter similarly develops in cattle. A search for these cysts is one of the objects of meat inspection. Sheep and rabbits frequently harbour cysts which develop into adult *Taenias* in the dog. One of these occurs in the brain producing symptoms of "gid" in sheep, *see* Plate, fig. 9. Cattle, sheep, horses and rabbits frequently harbour adult intestinal cestodes belonging to the family Anoplocephalidae. Although of economic importance, no information is available concerning their life history and intermediate hosts. In towns, dogs and cats are quite frequently heavily infested with tapeworms of relatively small size which are made up of lentil-shaped segments and belong to the genus *Dipylidium.* The lice and fleas which infest these animals are their intermediate hosts. A peculiar type of life history is that seen in the minute *Hymenolepis nana,* one of the commonest tapeworms in the United States. Man appears to act as intermediate as well as definitive host for this parasite. Larval development takes place in the wall of the small intestine in which the adult subsequently lives.

The cestodes so far described belong to the division Cyclophyllidea and are characteristically armed with four round suckers for purposes of attachment. The other main subdivision is named the Pseudo-phyllidea In this group the typical round suckers are replaced by two elongated slits. The most important member of this small group is *Dibothriocephalus latus* a parasite of man in Finland, Sweden, Latvia and Switzerland. It also occurs in other countries where lake fish form a staple article of diet. Infection is acquired from infected fish of the family Salmonidae, perch, pike, etc. These intermediate hosts acquire their infection from minute fresh water Crustacea belonging to the family Cyclopidae, which in turn have swallowed and been infected by the swimming larva which hatches from the eggs passed by infected man. For many years an anaemia resembling pernicious anaemia has been attributed to infection with *D. latus,* but recent studies have failed to bring evidence in support of these earlier clinical deductions.

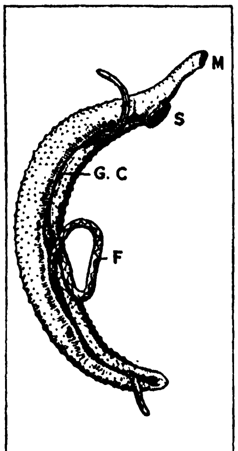
PARASITISM, a one-sided nutritive relation between two organisms of different kinds, a relation which is more or less injurious, yet not usually fatal, to the host, a relation, moreover, that relieves the parasite from most of the activity or struggle which is usually associated with procuring food, and thus tends to favour or induce some degree of simplification or degeneracy. The parasitism may be (*a*) between one animal and another, *e.g.*, between tapeworm and dog; or (*b*) between an animal as host and a plant as parasite, *e g.*, the salmon infested with a *Saprolegnia* fungus; or (*c*) between one plant and another, *e.g.*, dodder on clover; or (*d*) between a plant as host and an animal as parasite, *e g.*, the ears of wheat infested by a minute threadworm, *Tylenchus tritici,* which causes "ear-cockles"; or (*e*) in rare cases, e.g., *Bonellia,* the male is a parasite of the female.

Variety of Parasitic Relations.—Parasitism takes many forms and occurs in many degrees, so that hard and fast definition is impossible. An organism may be parasitic during one period of life and independent at other times; thus the larval stages of hookworm live in the soil, the adult stage is reached in man's intestine; or again the young forms of the horsehair-worms (*Gordius*) occur in insects, whence the adults emerge into the water. The parasitism of the strange copepod crustacean, *Lernaea bran-*

chialis, common on the gills of the haddock, is confined to the female and does not begin until after pairing has taken place. In two or three angler-fishes, the male is a parasite of the female.

The parasite may be externally associated with the host, like mange-mites on dogs, but this ectoparasitism has also its grades, varying with the extent to which the host is punctured or penetrated by the parasite. Thus the rhynchocephalid crustacean *Sacculina* protrudes visibly on the ventral surface of the parasitized crab, but its root-like absorptive processes penetrate through and through its host, and the bean-like adult stage is actually a burrowing endoparasite that has come to bulge out like a hernia. The larval stage of *Sacculina* is a free-swimming nauplius. It might seem an easy matter to distinguish between outside and inside, but when the ectoparasite is sedentarily fixed to the skin and absorbs food by an intruded portion of its body, it becomes difficult to determine, as in some of the sedentary plant-mites, how far in it must go before becoming an endoparasite. It is no easy matter to decide whether small animals, such as mites, that wander about on the surface of an animal's body are to be regarded as parasites. Some are only scavengers, others draw blood, others deposit eggs in their host. On the whole the distinction between ectoparasites and endoparasites is convenient.



FROM SIR PATRICK MANSON, "TROPICAL DISEASES"

FIG. 1.—BILHARZIA (SCHISTOSOMUM HAEMATOBIUM)

The male is carrying the female (F) in a ventral groove (G C)

Distinguished from Epiphytic and Epizoic Relations.—Parasitism must be distinguished from epiphytic or epizoic relations. An epiphytic plant grows on another plant without deriving any nourishment from it, as in the case of orchids perched on trees. Similarly microscopic green Algae live on the surface of the coarse hairs of the Brazilian tree-sloths, and many a seashore crab carries a garden of seaweeds on its back. But if the crab such as *Hyas araneus,* has itself implanted these Algae, and if there is evidence that the crustacean is usefully masked, while the plant is benefited by being carried about, then the relation passes into a mutually beneficial external partnership.

An epizoic animal may live attached to another animal without deriving any nourishment from it, as a bunch of barnacles to the flattened tail of a sea-snake, or as a tunicate, a false oyster (*Anomia*), a serpulid worm, a polyzoon colony, and a sponge may all be found together on the shell of a whelk. But if the sponge (e.g., *Suberites*) should mask a hermitcrab ensconced in an empty periwinkle shell, and should be benefited by its association with the vigorously active animal, then the epizoic relation becomes a commensalism. Various marine animals, such as hydroids and even sea-anemones, live attached to large laminarian seaweeds, but without any nutritive relation.

Distinguished from Shelter-associations.—While the contrast between a parasitic relation and an epizoic or epiphytic one is in most cases clear, there may be some difficulty with what are called "shelter-associations." Thus the little pea-crab *Pinnotheres pisum* is often found off English coasts sheltering in the mantle-cavity of the Norway cockle; and other members of the pinnotherid family occur in other bivalve molluscs, as well as in worm-tubes and corals. A small bivalve is commonly embedded in the cellulose tunic of ascidians. The slender fish called *Fierasfer* insinuates itself tail-foremost into the end of the food-canal of sea-cucumbers (e.g., *Stichopus*), and of some large bivalves and starfishes. When the holothurian is placed in water with insufficient aeration, *Fierasfer* comes out and rises to the surface, taking gulps of air. A small fish, *Amphiprion,* with resplendent colours, lives inside a large sea-anemone, hiding itself deeply when disturbed. It does not seem to do either good or harm to the sea-anemone, but it is said to die when dissociated from its "host."

Similarly some insects find shelter in plants on which they do not feed. A spider may frequent a particular flower, another makes its web in a pitcher-plant. Many ants live in hollow stems and thorns, but feed elsewhere; they get nothing but shelter from the plant and confer no benefit. But in other cases the sheltering ants feed on secretions exuded by glands of the plant, and in return they form a "bodyguard" which is regarded by some, on perhaps insufficient evidence, as useful in warding off the attacks of leaf-cutting ants and other unwelcome visitors. Some plant-mites live in little shelters on the plants they frequent. The moist spaces between the leaves of the epiphytic bromeliads of tropical forests afford shelter to an astonishing number of more or less epiphytic insects, and the inter-relations are sometimes so subtle that firm classification becomes, as might be expected, almost impossible. It is an unscientific pedantry that seeks to put every grade of inter-relation into a separate pigeon-hole. There are also puzzling epiphytic shelter-associations between plant and plant, one of the best known being the occurrence of the alga, *Nostoc,* in certain parts of the water-fern, *Azolla,* and in the liverworts *Anthoceros* and *Blasia.*

Distinguished from Commensalism and Symbiosis.—From commensalism, if defined as a mutually beneficial external partnership between two organisms of different kinds, ectoparasitism is distinguished by being one-sided. From symbiosis, if defined as a mutually beneficial internal partnership between two organisms of different kinds, endoparasitism is distinguished by being one-sided. It is always more or less prejudicial to the host. As the definitions here adopted are historically justified and are very convenient, it seems undesirable to use "symbiosis" loosely for the intimate living together of two kinds of organisms, and then to subdivide it into parasitism and commensalism, as has been sometimes proposed. On this usage a mutually beneficial nutritive partnership, *e.g.,* between clover and its tubercle-forming bacteria, is called "reciprocal parasitism," and "commensalism" is used to include "those cases of symbiosis in which two or more organisms live together with possible benefit to some or all of the symbionts, but with injury to none." The usage adopted in this article is to distinguish endoparasitism from symbiosis and ectoparasitism from commensalism, and to recognize other linkages, such as the epiphytic and epizoic habits.

But emphasis must also be laid on the fact that parasitism is a nutritive relation, and there may be utility in following the botanists referred to in distinguishing among plants (*a*) the independent autophytes, which obtain all their food from inorganic sources, and (*b*) the dependent heterophytes, "whose existence depends upon antecedent or coexistent organic forms, because they derive at least a part of their food from organic sources." These heterophytes are then divided into saprophytes, which obtain food from dead organic matter, and parasites which obtain food or food materials from living organisms. On this classification of nutritive habits, a special corner would need to be found for carnivorous plants which obtain their food partly from inorganic sources and partly from the animals they capture. Among the bacteria and other plants that live in the alimentary tract of animals, it is sometimes difficult to draw a clear line between those that live on non-living material and those that attack living tissue. But all biologists are agreed that a parasite is in a relation of more or less nutritive dependence on its host.

Stricter Definition of Parasitism.—The biological concept of parasitism has been blurred by uncritical usage. When an animal is found to be infested externally or internally by other animals which are habitually present and are not found living independently, and when there is some degree of dependence between the infesting animal and the other, the term parasitism has been used without hesitation. Yet it seems of little value to apply the same ecological term to (1) a flea promenading over the skin and puncturing here and there for blood; (2) a tick firmly fixed with its mouth-parts deeply inserted in the dermis; (3) a follicle-mite, such as *Demodex folliculorum,* with the whole worm-like body embedded, and only the head end showing; (4) larval mites of *Trombidium* burrowing in the skin; (5) the microscopic larval cercariae of *Bilharzia* in the act of burrowing from the surface of man's skin to the interior; (6) the large maggots of the ox

warble-fly, which have come to lie passively under the skin, resting after a prolonged internal journey, and awaiting subsequent pupation in the soil; (7) the full-grown female Guinea-worm, lying in a long coil beneath the skin, and pressing upon it until a sore is formed. These are instances of the variety of habit seen among "parasites" near the surface of another animal.

Similarly for endoparasites, there is great diversity. Many infusorians and nematodes live in the large intestine on putrefying undigested food-material; they can hardly be called symbionts except in special cases, but they do little harm. Tapeworms have their heads attached to the wall of the intestine, but this has no nutritive significance, for it is the whole long surface of the body that absorbs the digested food of the host. Here is a passive mode of life, almost quite away from the struggle for existence, and here also is unmistakable degeneration. Another grade is illustrated by many parasites which depend not on the food of their host, but on the living tissues, and here again a distinction may be drawn between those, like growing bladder worms and *Sacculina*, that absorb lymph or other fluids from the surrounding tissue, and those, like larval ichneumon flies, that directly devour the living tissues of their hosts. The formidable hookworm sucks blood from the intestinal wall, the liver-fluke feeds on the blood of the sheep's liver, but the malaria organisms and many others live in the blood-stream itself, destroying the red blood-corpuscles. Not a few cases besides rhizocephalid crustaceans are known where the parasite castrates its host. The concept of parasitism would be clearer if there were excluded from it all cases where the infesting organism lives an energetic predatory life.

From a broad biological outlook parasitism is a negative reaction to the struggle for existence, and always implies the discovery and adoption of a mode of life that is nearer the line of least resistance. On this view the most diagnostic feature in parasitism is some retreat from strenuous struggle and independent endeavour. To some extent, to put it more metaphorically, the swimmer becomes a drifter. Thus the larvae of an ichneumon-fly, which are hatched out within a caterpillar and proceed to devour it from within, are hardly less predatory than the lion which devours the antelope from without. The larvae have none of the degenerative stigmata of thoroughgoing parasites. Similarly, while many of the protozoon parasites are sluggish throughout a great part of their life, many remaining for a long time within the same cell, it is more difficult to apply the term parasite to such organisms as the exceedingly active trypanosomes that cause sleeping sickness and allied diseases. They have their quiescent phases, but much of their life is spent in charging about among the blood-corpuscles at a high velocity. Many of the protozoa are much simplified cells, but not the flagellate trypanosomes.

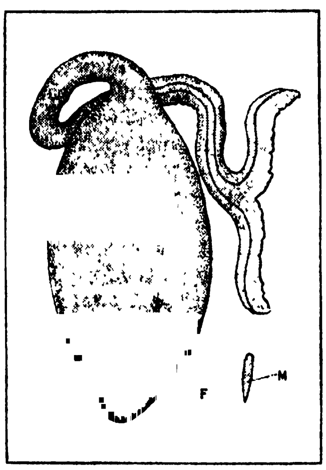


FIG. 2.—MALE (M) AND FEMALE (F) OF BONELLIA VIRIDIS, AN ECHIUROID WORM

And again, as regards ectoparasites, is not the definition blurred by including such types as the flea? That it is more habitual than a leech in its blood-letting does not make it less of a predatory animal. Its compressed body may be adaptive to escaping capture as it moves swiftly among the hairs of a mammal's skin, but it has no marks of degeneracy in its adult life. It is on an ecological level quite different from that occupied by such types as mange-mites.

Classification of Parasitic Animals.—Protozoon parasites are illustrated by the entire class of Sporozoa, including the malaria organism (*Plasmodium*); by some rhizopods, such as the *Amoebae* of man's mouth-cavity and intestine; and by some infusorians, such as the mouthless, ciliated, multinucleate *Opalina* of the frog's rectum, and predatory forms like trypanosomes.

There are no parasitic sponges. Among Coelentera there are but a few instances; thus the polyp, *Polypodium hydriforme*, occurs on the ova of the sterlet, *Acipenser ruthenus;* the medusoid, *Cunina* (*Cunoctantha*) *parasitica* is found in close association with another medusoid, *Geryonia proboscidalis*, and *Cunina octonaria* in the bell of *Turritopsis*. The Mesozoa (dicyemids and orthonectids) are all parasitic.

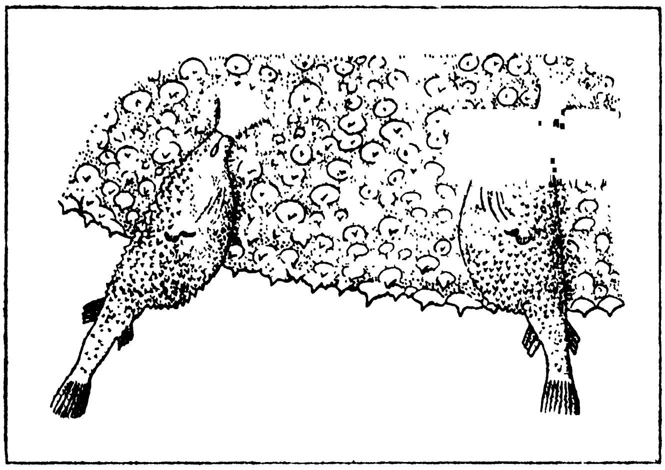
Among plathelminths, a few turbellarians are parasitic (*Graffilla* in marine molluscs, *Anoplodium* in or on holothurians); the trematodes are all either ectoparasites or endoparasites; the temnocephalids hang on to freshwater crayfish, crabs, turtles, etc., but do not feed on their hosts; the series has its bathos in the cestodes which are all endoparasitic, both in their larval (bladder worm) and adult (tapeworm) stages. All the nemerteans are free-living, unless two or three found on crustaceans can be called parasites. The aberrant Malacobdella found in the bivalve *Cyprina islandica* does not seem to do more than capture inswept organisms.

Numerous nematodes are parasitic, others saprophytic, but it is difficult to draw the line. Most of the parasites live in the alimentary canal and find nourishment in the half-digested food or in the putrefying undigested residue. Many of them are most accurately regarded as internal saprophytes, and are active agile animals. It is otherwise with the hookworm which sucks blood from the wall of the food-canal, or the gapes-worm which does the same in the windpipe of chickens. Distantly allied to nematodes are the Acanthocephala, e.g., *Echinorhynchus*, thoroughgoing parasites without mouth or food-canal. They are digenic, passing from arthropod to vertebrate; thus *Echinorhynchus gigas* of the pig has its larva in the grubs of cockchafers and the like.

Parasitism is very rare among chaetopods, but the mouthless pigmy males of *Bonellia* and *Hamingia* live within the females. The interesting discodrilids are found on freshwater crustaceans, —*Branchiobdella*, on the gills of *Astacus fluviatilis* and the American *Bdellodrilus* on *Cambarus*. These two types seem to be genuine *Oligochaeta*, but they are without setae and possessed of suckers and chitinous jaw-plates. In other words, there is a slight convergence towards leeches, in adaptation to a somewhat similar mode of life. Leeches (Hirudinea) themselves should be regarded as predatory, not as parasitic. The small Myzostomaria, e.g., *Myzostoma*, which form galls on crinoids, are perhaps offshoots from primitive annelids, degraded in relation to the parasitic mode of life. A few rotifers, e.g., *Albertia*, are parasitic in or on freshwater oligochaets; *Seison* occurs on the primitive marine crustacean called *Nebalia; Discopus* attaches itself to *Synapta*, and *Callidina parasitica* to the limbs of the freshwater crustaceans *Gammarus* and *Asellus*.

There are no parasitic echinoderms. The habit is common among the lower crustaceans, especially among copepods, many of which are called "fish-lice," e.g., *Caligus* and *Lernaea*. Many grades occur, for the association may be temporary or permanent (except in the early larval stages), and is often confined to the females. On the other hand the male may be reduced in size and a parasite on the female, as in *Chondracanthus*. Allied to the barnacles (Cirripedia) are the peculiar Rhizocephala, e.g., *Sacculina*, which occurs protruding from the ventral surface of the tail of crabs. It starts life as a free-swimming nauplius; it develops into a cyprid larva and fixes itself to a young crab at the uncalcified membrane around the base of a large seta. Its tissues dedifferentiate and pass into the crab; eventually, as it approaches maturity, it protrudes on the abdomen. The full-grown sac consists mainly of hermaphrodite reproductive organs, nourished by numerous absorbent root-like processes which spread through all the tissues of the crab. *Sacculina* lives for about three years, arresting the crab's growth, and causing degeneration of the gonads. In the case of male crabs the parasite so alters its host's constitution that it changes its secondary sexual characters, becoming more or less female in appearance. In short, *Sacculina* not only effects "parasitic castration," but partly reverses the sex of the male. There are various related forms, one of which, *Sesarmaxenos*, occurs on a freshwater crab, *Sesarma*, in the Andamans. Some of the true barnacles, normally hermaphrodite,

have small parasitic, "complementary" males, e.g., *Scalpellum villosum;* others, e.g., *S. regium,* are unisexual, but the males are minute and parasitic on the females. Even among the higher crustaceans, parasitic forms occasionally occur, notably the epicarid isopods, e.g., *Bopyrus* and *Entoniscus,* which infest other members of the class. The young forms are free-living and male, the adults are parasitic and female; but it seems that while all



FROM B. SAEMUNDSSON, IN "VIDENSKABELIGE MEDDELELSER FRA DANSK NATURHISTORISK FORENING" (C. A. REITZEL, COPENHAGEN)

FIG. 3.—TWO MALES OF ONE OF THE ANGLER FISHES (CERATIAS HOLBOELLI) ATTACHED CONTINUOUSLY TO THE FEMALE'S SKIN. 3/4 NATURAL SIZE

females pass through a male stage, without genital ducts, those males that become functional never grow up into females. Many epicarids cause parasitic castration of their hosts. Some of them afford good instances of hyper-parasitism, or parasite upon parasite. Thus a very common Mediterranean species, *Danalia curvata,* is parasitic on *Sacculina neglecta,* which in turn is parasitic on the spider-crab, *Inachus mauretanicus.* Somewhat similar to the epicarids are the cymothoids, not nearly related, though also in the order Isopoda. They infest the gill-chambers, mouth-cavity and skin of various fishes.

True parasitism is not to be expected among the winged insects, but many wingless types, such as lice, are parasites, and some free-living winged insects, like warble-flies, have parasitic larvae. The blood-sucking lice or Pediculidae constitute an order ectoparasitic on mammals. They are marked by absence of wings, small head with simple eyes or none, large abdomen and by the adaptation of the claws to clutch the hairs; but it cannot be said that lice are particularly degenerate. They appear to us to be not far removed from the predatory. This is even more marked in the case of the biting-lice or bird-lice (Mallophaga), which occur on birds and a few mammals, feeding not on blood, but on skin-cells and fragments of feathers and hairs. Some birds shelter numerous species of Mallophaga; thus the hen has nine; but occasionally a particular species of bird-louse is restricted to a particular species of bird. Related species are often found on related hosts. This specificity is often to be noticed in parasites, yet there are others, such as the liver-fluke, that have many different hosts. But as to the Mallophaga, there does not seem to be much of the parasite about them; they are skin-scavengers, and the same may be said of fleas and of the sheep-tick (*Melophagus ovinus*), a wingless fly. It is different, however, with the larvae of bot-flies and warble-flies, which illustrate temporary parasitism. A curiously isolated case of alleged parasitism is *Platypsyllus castoris,* a beetle found on beavers. In many of the ichneumon-flies and related types, which lay eggs in caterpillars and the like, the predatory larvae are themselves parasitized. This "hyper-parasitism" is sometimes carried far. Thus the caterpillars of *Hemerocampa leucostigma* which defoliate many trees in the north-eastern United States have 33 primary parasites, 13 secondary parasites, 2 (perhaps 5) tertiary parasites, and one of these (the chalcid *Asecodes albitarsis*) may be in some cases not tertiary but quaternary.

Among arachnids various degrees of parasitism are illustrated by mites and ticks, some externally adherent, others burrowing in the skin, a few, like the bee-mite, penetrating deeply. Sometimes placed in the vicinity of arachnids are the vermiform pentastomids, e.g., *Linguatula,* found in the nasal cavities and frontal sinuses of carnivores, crocodiles, snakes and some other flesh-eating animals. Apart from a few gastropods, such as *Entoconcha mirabilis* attached to blood-vessels in *Synapta,* there are no parasitic molluscs. Nor are there any parasitic vertebrates except the pigmy males of some angler-fishes.

A survey of parasitic animals shows the widespread distribution of this mode of life. But it is of rare occurrence (*a*) among types that are sensitive to stagnancy; thus there are no parasitic echinoderms; (*b*) among types that breathe dry air; thus endoparasitism is relatively uncommon among insects; and (*c*) among types whose shape of body is markedly unsuitable.

Parasitic Plants.—These will be dealt with separately, and they are only referred to here to give greater completeness to the general biological picture. Plants may be parasitic in or on animals, a striking case being a rod-like fructification of a fungus (*Cordyceps*) that grows out for several inches from the head-end of a parasitized larva, such as a caterpillar or a grub. The common house-fly is often seen dying from the ravages of a fungus, *Empusa muscae,* the spores forming a white powder around the moribund insect; another species is from man's point of view very useful as a check on the multiplication of green-flies.

An estimate of the number of parasitic animals that infest plants varies according to the conception of parasitism. The phytoptid gall-mites, which cause swellings on many plants, have only two pairs of legs, very simple mouth-parts, and a worm-like body, thus showing some marks of the degeneration so often associated with thoroughgoing parasitism; but it seems hardly justifiable to rank the numerous leaf-miners and stem-borers as parasites in the strict sense. They have adopted an internal herbivorous mode of life. Similarly it seems doubtful if a species of trypanosome that lives in some spurges is really a parasite.

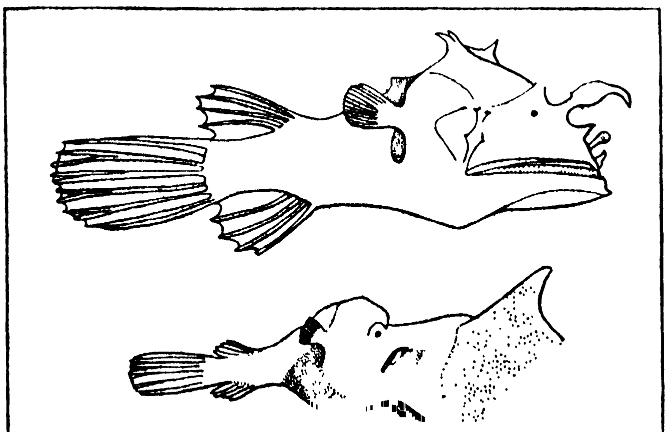
Of plants parasitic on plants there are multitudinous instances, though not approaching the diversity illustrated by animals parasitic on animals. At the one pole are parasitic moulds, mildews and rusts; at the other pole the dodder on clover or the toothwort on hazel roots.

Very clear among parasitic plants is the contrast between partial and complete parasitism. Thus the mistletoe is a partial parasite, for it is usually believed to take nothing but water and salts from the tree on which it grows. Its own green leaves are capable of normal photosynthesis. Yet there is no hint of reciprocity on its part, as has been experimentally corroborated by defoliating the bearer. In contrast to the mistletoe, the leafless and chlorophyll-less dodder is a familiar illustration of complete parasitism, for it depends on its host not only for water and salts, but for organic food in the form of carbohydrates and proteins. Eyebright and yellow rattle are good instances of partial parasites, for while they have green leaves and can absorb soil-water, they get on better if their roots come into organic continuity with the roots of neighbouring plants such as grasses. The related cow-wheat, though green, cannot survive without external aid. In the Alpine *Tozzia,* belonging to the same family, the whole first year is spent as a complete parasite underground; in the second year there rises a flowering shoot with yellow-green leaves. In broomrapes the parasitic dependence has gone still further, for the seeds will not germinate unless they are in contact with a suitable host, such as broom; there is no chlorophyll and apart from the underground absorbing system there is nothing left but flower-stalk. The extreme simplification of the vegetative system is seen in the *Rafflesias,* where "the whole vegetative body of the parasite may live inside the host-plant, reduced to a spreading weft of undifferentiated filaments, roots, stem and leaf alike lost." From this degenerate vegetative body, none the less effectively adapted for absorption, there burst forth strange and brilliant blossoms. One of them, *R. arnoldii* of Sumatra, is the largest of known flowers, with the immense diameter of a yard.

The vegetative body of *Rafflesia* may be reasonably called

degenerate, but it must be asked, following MacGregor Skene, whether all the simplifications of parasitic plants deserve this term, and whether the simplifications are to be regarded as primarily associated with the parasitism. The beginnings of reduction, *e.g.*, in leaves and in amount of chlorophyll, are often to be seen quite apart from parasitism. Some reduction in assimilatory power, or some other inferiority in competing with rivals in crowded conditions, may prompt root-parasitism or some other parasitic dependence. And when the habit of parasitism or partial parasitism has begun, it is natural to suppose that degenerative variations, *e.g.*, towards "golden leaves" or albinism, would be better able to survive because of the abundant nourishment supplied by the host.

Origin of Parasitism.—(*a*) Many animal parasites, such as some of the nematodes, may have begun as saprophytes. Several flies that normally lay their eggs in putrefying animals, may similarly utilize the abrased skin of one that is still living. (*b*) Many animals are cryptozoic, given to hiding themselves, negatively heliotropic, fond of narrow passages, and this is another way in which parasitism may arise. The commonplace is often overlooked that the host is not to the parasite another organism, but merely a convenient and attractive environment. (*c*) But it is likely that parasitism often arose when the struggle for existence was extremely keen, when even slightly open doors were welcome. As we have indicated, the most characteristic feature in parasitism is probably a kind of constitution more inclined to drift, rather than to swim. Just as some animals became cavernicolous, others became parasitic. (*d*) Crustacean parasites are particularly interesting because they afford many illustrations of parasitism restricted to the females. The parasitic habit arose in connection with the advantage of securing sheltered nooks for liberating the eggs or offspring. (*e*) Where the sex dimorphism is very pronounced, as in *Bonellia,* many copepods, and two mid-water anglerfish, there would be an advantage to the males and to the species, perhaps even to the females, in the occurrence of parasitic males, securing fertilization. In the anglers alluded to, which occur sparsely in thinly-peopled waters, the female carries the minute male, and all his nourishment is derived from an organic connection between his head and the blood-vessels of some part of her



AFTER SAEMUNDSSON, IN "PROCEEDINGS OF THE ROYAL SOCIETY"

FIG. 4.—FEMALE OF ONE OF THE ANGLER FISHES (PHOTOCORYNUS SPINICEPS), WITH THE MALE ATTACHED IN FRONT OF THE RIGHT SUPRA-ORBITAL SPINE, SHOWING, IN THE LOWER FIGURE, THE UNION BETWEEN THE PARASITE MALE AND FEMALE

skin. (*f*) It is possible that parasitism has in some cases evolved from shelter-associations and from commensalism (*see* SYMBIOSIS); as we have indicated it is often difficult to draw the line. (*g*) Probably one parasitism has frequently arisen from another. That is, the parasite of a freshwater crustacean may become adapted to become secondarily parasitic in a freshwater fish which habitually feeds on the first host. An elaboration of this extension of range comes about when different phases of life are restricted to each of the two hosts, a common punctuation being that an asexual phase occurs in the one host and a sexual phase in the other. Leuckart, who discussed the problem carefully, came to the conclusion that the "intermediate host," now containing the young non-reproductive phase, was the original host, and that the "secondary or definitive host" has been added on. Yet it is conceivable that in some cases the intermediate hosts of the immature stages have been intercalated. When there are two hosts, there is usually, though not invariably, this relation between them, that the intermediate host is part of the normal diet of the definitive host.

Damage Done to Host.—It is usual to emphasize the fact that it is usually not in the parasite's biological interest to destroy its host. In many cases, *e.g.*, follicle mites in man, or *Monocystis* in earthworms, the parasite is small compared with its host and the damage done may be unimportant. Yet a heavy infection with threadworms may be fatal to a horse, and if ichneumon-grubs are regarded as parasites, an interpretation here departed from, they are obviously fatal to their caterpillar hosts. Much depends on the numerical strength of the infection; a few gall-larvae, each imprisoned in its gall, may be regarded as trivial, but a multiple infection of a currant bush with "big bud" mites may be fatal. Then a distinction must be drawn between parasites that multiply in their host, as nematode worms often do, and those, like tapeworms, that cannot increase in number within the same animal. It may be that rapidly destructive parasites have been persistently eliminated in the course of evolution, as would naturally happen if they destroyed their host before becoming themselves reproductive. But the large fact to be emphasized is that in many cases a give-and-take relation is established between the parasite and the host, such that the parasite does not get the upper hand and the host is not too seriously prejudiced. In the intestinal caeca of the grouse there are often thousands of invisible transparent nematodes (*Trichostrongylus pergracilis*), whose early stages are found on the heather. If the grouse is otherwise in good condition, its nematodes seem to be unimportant, but if the grouse be constitutionally below par, the parasites may multiply excessively (10,000 in one bird) and fatally. When parasites or quasi-parasites prove quickly destructive, it is usually when they find their way into a new host that has no natural counteractives to their influence. This is illustrated by bacteria when they find themselves in a new host which has not the wonted natural checks, such as anti-bodies.

As to the nature of the damage done by parasites, it may be enough to mention the most outstanding effects:—robbing their host of much half-digested food; absorbing much blood; causing serious pressure on adjacent parts (the sturdie-worm on the sheep's brain); perforating the intestinal wall (as large threadworms sometimes do); blocking passages, as bee-mites (*Acarapis woodi*) in the tracheae of bees afflicted with "Isle-of-Wight" disease. More unusual is castration, *e.g.*, that of crabs infected by parasitic epicarids; or the formation of open sores by emerging guinea-worms; or the production of cancerous growth in fishes and rats by the irritation of nematode worms (*Gongylonema*).

It has been proved that some animal parasites are toxic. (*a*) Thus the malaria organisms produce toxic substances in the red blood corpuscles, and these are liberated when the corpuscles break up, causing fever. Sarcosporidia of sheep contain toxic substances which are fatal in very small quantities when injected into rabbits. (*b*) When the big bladders of *Taenia echinococcus* burst and the fluid escapes into the body cavities, there is violent poisoning; and the fluids of other bladderworms have been shown to be toxic. (*c*) Adult tapeworms, such as *Dibothriocephalus latus,* are also toxic, producing a haemolytic lipoid, which is liberated when segments disintegrate, and perhaps also as a secretion. Thus the anaemia of human patients suffering from worms becomes more intelligible. (*d*) *Ascaris* produces in the routine of its metabolism volatile aldehydes and fatty acids like valerianic and butyric. If the worms die and disintegrate in the intestine, the liberation of these substances may produce toxic effects. The poisoning observed in trichinosis is probably due to products of the parasite's metabolism and of the muscle-disintegration.

Adaptive Characters of Animal Parasites.—The assumption of a parasitic mode of life is a habitudinal reaction to the intensity of the struggle for existence, and while there is no dis-

charge from that war, intimate dependence on another organism for food and shelter implies to some extent a life of ease. What adaptations are there to the parasitic mode of life?

(1). Many parasites have structures that lessen the risk of dislodgment, *e.g.*, the adhesive suckers on the head of tapeworms, the gripping hooks of the hookworm, the attaching hold-fasts of parasitic copepods. (2). Many parasites are specially adapted for the absorption of food from the host. A very simple adaptation is the great increase of absorptive surface in tapeworms, which may be many feet long. In *Sacculina* the absorptive processes ramify like roots right through the body of the parasitized crab. The head of the pigmy parasitic male of the mid-water angler is concrescent with the tissue of the female who carries him The strange gastropod parasite *Entoconcha* has its head thrust into a blood-vessel of its synaptid host. When the available food from the host is very abundant it may be utilized by the parasite in a somewhat uneconomical fashion; thus some nematodes ferment glycogen into valerianic acid, carbon dioxide and hydrogen, which is far from making the most of the material. In tapeworms the whole surface of the body absorbs liquid food. Parasites deeply imbedded in tissues must be nourished by the lymph just as if they were parts of the host. (3). It is characteristic of many thoroughgoing endoparasites that they can survive in conditions where free oxygen is apparently very scarce. In most cases they seem to obtain a sufficient supply from the blood or tissues of their host, just as if they were parts of the body. There is no modern corroboration of the older view that some parasites can live anaerobically. (4). Many parasites, such as nematodes, crustaceans, insects, mites have a chitinous cuticle, which is very resistant, *e g*, to bacteria and to digestive juices. (5). There are some noteworthy adaptations in connection with reproduction Thus resistant egg-shells are characteristic of platyhelminths, and the tapeworm's liberation of an entire joint, capable of some independent movement, must often be advantageous The difficulty of securing fertilization, when the parasites do not occur in large numbers together, is met in various ways, *e g*, (*a*) by a very prolonged association of the sexes as in *Bilharzia*, where the male carries the female, or in *Chondracanthus* where the female carries the male; or (*b*) by self-fertilization or autogamy, as in the liver-fluke; or (*c*) by an emergence of the sexually mature forms into freedom, as in horsehair-worms (*Gordiacea*) There are some very remarkable cases, notably the trematode, *Diplozoon paradoxum*, where two mature hermaphrodite individuals are united in a permanent coition In *Wedlia* two individuals are found together inside a cyst, the smaller one—the male—imbedded into a protrusion of the vesicular posterior body of the larger one—the female But each individual shows traces of the gonads of the opposite sex, so that this looks like a secondary abandonment of hermaphroditism, when arrangements for securing fertilization had been in the course of time established.

(6). Deserving consideration by itself is the prolific multiplication. Leuckart's estimates have been often quoted, that *Taenia solium* may produce 42,000,000 eggs in a year, and *Ascaris* 64,000,000. It is possible, no doubt, to discover free-living animals still more prolific, such as the starfish *Luidia ciliaris* which Mortensen credits with containing 200,000,000 eggs, but there are not many instances of such extraordinary fecundity, even among fishes.

The eggs and larvae of parasites are often subject to severe elimination; the chances of death are enormous. Therefore in the course of the evolution of parasites, variants in the direction of increased reproductivity would have survival-value

Some Evolutionist Problems.—(1) It must not be facilely supposed that the adaptive peculiarities of parasites illustrate individual modifications that have hereditarily accumulated until they have become racial characters. Organisms that have begun the parasitic mode of life because of certain constitutional weaknesses may continue to show congruent germinal variations, some of which may have selective value. (2) It must not be too confidently assumed that all the diagnostic peculiarities of parasites are as such engrained hereditary characters. Many of them may be individual structural reactions to the peculiar conditions of life, which recur with each generation. An organism's characters develop as the outcome of environmental, nutritional and functional nurture operating upon hereditary nature. There is much to be said for the view that the pigmy male of *Bonellia* suffers arrest of development partly because it absorbs the secretion on the proboscis of the female. More attention should be paid to phenomena like those of "physogastry" in the guests of the white ants, where extraordinary deformations of body come about in probably direct individual reaction to the special conditions of life. But in all such cases a specific capacity for reaction is inherited. Experimental inquiry is also needed to show whether some of the specific characters of nearly related parasites may not be modificational Nearly related species in different hosts should be exchanged in early life. (3) It may be noted that many parasites probably illustrate the results of "isolation," which narrows the range of inter-crossing. For not only is the host in some ways like an island, to take the simplest form of "isolation," but the combination of circumstances which secure fertilization, dispersal, a second host, and so forth, is often so subtle that it operates as an isolating evolution-factor

PARASITOLOGY. The object of parasitology is the study of those organisms (parasites) which during the whole or a part of their life live upon other organisms (hosts). The parasite does not destroy its host immediately or rapidly even when both are of the same size. On the contrary, a perfect parasite while deriving its food and often protection from the body of the host, lives economically in doing as little direct damage to the host as possible. In this respect it differs from a predatory or carnivorous organism which recklessly destroys and utilizes its victim The association between the parasite and the host is beneficial and essential only for the parasite, while it is not beneficial, almost always harmful, and often fatal for the host It is, however, impossible to draw a sharp line separating parasitism from other modes of life such as saprophytism, carnivorism, commensalism, mutualism and symbiosis

Parasites, according to their mode of association with the host, can be divided into various groups such as. (1) permanent parasites which are parasitic throughout their life (tapeworm): (2) temporary parasites which live upon their host only during certain periods of their development (maggot of a warble fly): and (3) intermittent parasites which come only temporarily in contact with their host According to the localization, the parasites may be separated into ecto- and endoparasites The latter may invade the open cavities or the tissues of different organs; they may live inside the closed cavities of deeper organs; or inside the protoplasm, or even nuclei, of the cells.

No sharp line can be drawn between the different categories of parasitic adaptation The following examples will illustrate a typical transition between the free-living mode of life, intermittent and stationary ectoparasitism and endoparasitism. Among the mosquitoes only the females are blood-sucking, while the males are harmless and live upon plant juice. (1) There are, however, some wood mosquitoes which can complete their life history without taking a single meal of blood. (2) The malarial mosquito (*Anopheles*) can live without taking blood but the female will not lay eggs unless it has at least one blood meal. (3) The yellow fever mosquito (*Stegomyia*) lives and breeds near houses, and the female sucks blood more often. (4) The bed bug (*Cimex*) lives in the house and very near its food supply with which it can get in contact at more or less regular intervals. (5) The flea remains upon the host much longer than is required for the meal. (6) The body or head louse remains always upon the host, over the body of which it moves freely. (7) The crab louse is more stationary in habit, it moves very little, and is more adapted to the host. (8) In the case of the chigger flea (*Sarcopsylla*), common in tropical countries, the female penetrates deep into the skin forming

a small tumour. (9) Finally, there are larvae of insects which form deep galleries under the skin or invade open cavities of the host producing more or less dangerous cases of myiasis.

Distribution of Parasitism.—The parasitic mode of life is very widely distributed among bacteria, fungi, higher plants and animals. The parasitic bacteria (*see* BACTERIOLOGY) are known to invade and produce various diseases in man, animals and plants. In man for instance, tuberculosis, leprosy, diphtheria, pneumonia, enteric fever, tetanus, cholera, plague and other diseases are caused by parasitic bacteria. Relapsing fever and syphilis are caused by parasitic spirochaetes, which are organisms allied to bacteria.

The entire class of fungi is composed of organisms which derive their nourishment from other organisms, living or dead, and they contain an enormous number of forms parasitic on plants and on animals. They cause the smut and rusts of cereals; mildew of grape-vine; and blight of potatoes. In animals and man they cause ringworm, actinomycosis and many other diseases.

The largest number of parasitic forms and the greatest variety of parasitic adaptations, are found among animal organisms. Almost every order or phylum has parasitic representatives and certainly every animal can act as host to a variety of parasites belonging to several phyla. Protozoa, helminths and insects are the most widely distributed parasites, occurring in the greatest variety of hosts.

Parasitic helminths occur in representatives of most of the orders of the animal kingdom, and parasitic insects are found to attack a great variety of terrestrial animals. A great number of parasitic forms are known among Crustacea, but the range of their hosts is more limited. It is interesting to note that while parasitic insects have a special predilection to invade other insects, so the parasitic Crustacea have a tendency to live upon other Crustacea. Parasitism occurs also in Coelenterata, Rotifera, Annelida, Mollusca and even in fishes (Cyclostomata, *q v*).

Parasitism is so common in nature that it is hardly possible to find representatives of any species of animal which do not harbour parasites of some sort, and often the same individual is invaded simultaneously by parasites of various orders

Hyperparasitism.—There is no protection in nature against parasitic invasion. The parasite will reach its host however secluded may be its position. An insect burrowing itself deep into the tissues of a plant is not protected from invasion by another parasitic insect, which will find a way to insert its eggs on the skin or inside the body of such a burrowing host. Even the parasite living right inside the body of its animal host is not secure against attack by another parasite. The latter, which is called a hyperparasite, will reach, and will live upon the primary parasite which may ultimately be destroyed, and all this takes place inside the body of the primary host. Hyperparasitism is known among protozoa and helminths, but is more frequent among parasitic Crustacea and is very common among parasitic insects

Sexual Parasitism.—The parasites in this case are usually the dwarf degenerate males which live upon or inside the normal female that acts as host. This kind of sexual parasitism is known in a marine worm-like organism, *Bonellia,* in which the microscopic male lives inside the female. In a nematode (*Trichosomoides crassicauda*) parasitic in the bladder of the rat, the male lives inside the uterus of the female In some fish *Edriolynchus schmidti* and *Photocrinus spiniceps* the very small and completely degenerate male is permanently attached to, and lives upon the body of the female. (*See* ANGLER; FISH.)

PARASITIC ADAPTATION

Morphology.—An organism adapted to the parasitic mode of life often undergoes such a great modification that it becomes difficult to recognize the group to which it belongs. A number of forms such as *Sacculina, Peltogaster, Portunion* or *Xenocoeloma* (in their parasitic stages of development) could hardly be recognized as belonging to various families of Crustacea, if it were not for the free-living larval stages showing the essential characters of the corresponding families. The same applies to various marine snails (*Gastrosiphon, Entoconcha* and *Enterexenos*) living as parasites in starfishes (echinoderms). Parasites have the tendency to lose their organs of locomotion, such as wings, legs and other appendages The skin, in endoparasitic forms, being already protected by the tissues of the host, becomes thinner and the articulations between the segments gradually disappear. Sensory organs become atrophied. The alimentary canal in some cases becomes atrophied (Guinea worm), or it may disappear completely (tapeworm), and the parasite then feeds through the whole surface of its skin (tapeworm) or by means of absorbing appendages (*Monstrillidae*), or a ramified root system (*Sacculina*).

Hermaphroditism.—This is also a condition frequently met with in parasites. This may be explained partly by the more or less fixed position of the parasite, which greatly reduces the chances of meeting between individuals of different sexes On the other hand, when the sexes are separate the sexual dimorphism is extremely marked, the female being usually much more developed than the male (except in the Bilharzial parasite), and both sexes show a tendency to live in close association. Thus, among the parasitic Crustacea the males are attached to the females. In a parasitic worm (*Syngamus trachealis*) which causes gapes in fowl, the body of the male is permanently fixed and almost fused to that of the female In Schistosomes, which cause human Bilharziasis, the female is carried in a tube formed by the lateral inrolling of the body of the male.

Fertility.—The life of a parasite with a more or less restricted host specificity, and which passes during its development through one or two intermediate hosts, is dominated by one main factor, namely the great losses of its progeny. In fact, an enormous percentage of its eggs, scattered haphazard, never find the right conditions for development; the greater proportion of the larvae which hatch never reach the host, and die in various stages of development; and among those which reach the right host, many are lost during the internal migration and never reach maturity. Of a parasite, we can say that it is not death, but life, which is a marvellous accident of nature The enormous losses sustained by parasites during the successive stages of their development are compensated by various means. One of them is their greatly increased fertility While various internal organs such as the alimentary canal, nervous system and circulatory system, are more or less atrophied, the genital organs, on the contrary, and especially those of the female, increase in size, proliferate and become very active It was calculated that the round worm (*Ascaris lumbricoides*), parasitic in man, produces 64 million eggs a year; while in a tapeworm (*Taenia solium*) 80 million eggs are formed every year The genital organs in some parasites fill the whole of the body cavity, and in a small round worm (*Sphaerularia bombi*) parasitic in the bumble bee, the gravid uterus and the vagina gradually protrude outside the body of the parasite, increase in size, and finally form an enormous sac to which the shrivelled body of the female is attached as a hardly-perceptible appendage.

Asexual Reproduction.—Asexual multiplication, which takes the form of fission, budding, or parthenogenesis, occurs usually in the young or larval stages of the parasite, especially when it infects the secondary or intermediate host. This kind of multiplication occurs in a great number, but not in all parasites. It is very common in Protozoa, Orthonectids, tapeworm and flukes; and it occurs also in parasitic Crustacea (*Thompsonia*) In insects the asexual multiplication assumes the form of polyembryony, and occurs in a few species of Hymenoptera parasitic in other insects. Here the female of a parasitic Hymenopteron (*Encyrtus*) lays only one egg inside the egg of the apple moth (*Hyponomeuta*), but during the development of the latter, the egg of the parasite divides into many cells which give rise to several embryos

Primary and Secondary Host.—The life history of a parasite is direct or simple when the parasite is transferred directly from one host to another of the same species, and in both of them undergoes the same type of development. The direct mode of development is found as a rule in the great majority of parasitic bacteria and fungi; it is common in Protozoa and helminths, and is almost general in parasitic Mollusca, Crustacea and insects. The life cycle of a parasite is indirect when the adult or sexual stage develops in a host of one species known as the primary or final host, while its immature stages are harboured by another, known as the inter-

mediate or secondary host.

THE LIFE CYCLES OF PARASITES

The parasitic mode of life is by no means uniform and uneventful. It is, at least, as full of events and perilous adventures as the life of any free-living organism.

The main types of life histories of parasites can be illustrated easily by a few examples of the species attacking man. They show all the variety of means by which the infective stages of the parasites are liberated from the infected host and disseminated to invade fresh healthy hosts.

Protozoa.—Plasmodium, the cause of malaria (*q.v.*) in man, is a minute unicellular parasite (*see* PROTOZOA) living in, and feeding upon the red blood corpuscles. The parasite grows inside the corpuscle, elaborates a special black pigment, and multiplies forming a rosette of several young forms. Then the red blood corpuscle breaks and liberates the young stages which immediately invade fresh blood corpuscles and undergo the same development. The multiplication of the parasites and the invasion of fresh corpuscles occurs at regular intervals, and provokes the characteristic attacks of fever. After a period of ordinary multiplication, some of the parasites develop into forms which will not multiply in the blood of man, but only undergo development when they are taken up with the blood by a mosquito (*Anopheles*). The main features of this development are the fertilization of the female element (macrogamete) by the male element (microgamete), and the formation of a cyst which will form an immense number of small elongated bodies known as sporozoites. The latter will ultimately invade various organs of the mosquito, especially its salivary glands; and will be inoculated into a healthy man when he is bitten by the infected mosquito. The mosquito can transmit the disease only 10 to 12 days after it becomes infected. Trypanosomes (*T. gambiense* and *T. rhodesiense*) are unicellular mobile organisms living and multiplying in the blood plasma and lymphatic glands of man and ultimately causing the much dreaded African sleeping sickness (*q.v.*). The parasites are transmitted from man to man by the bites of tse-tse flies (*Glossina palpalis* and others). The transmission is either mechanical, taking place within 24 hours of the infective meal, or cyclical, infection then taking place after about 18 days when the parasites have accomplished their cycle of development within the tse-tse fly.

Flukes.—Schistosomes, which cause Bilharziasis (*q.v.*) in man, differ from other flukes by having the sexes separate, the female living in a tube formed by the body of the male. The coupled worms live in the venous system surrounding the intestinal (*Schistosoma mansoni*) or urinary (*S. haematobium*) tracts of man. When fertilized, the female leaves the male, migrates into the small blood vessels which it distends, and there lays spined eggs. The eggs rupture the vessels, appear in the surrounding tissues and reach the lumen of the organs, to be expelled with the urine or faeces of the host. On reaching fresh water, the eggs burst, and liberate microscopic, ciliated organisms (miracidia) which within 24 hours have to find a fresh-water snail, which is the secondary host, otherwise they perish. They penetrate into the snail and become transformed into shapeless sacs (sporocysts), which by external budding form daughter sporocysts. The latter develop a number of small organisms (cercaria) composed of an elliptical body and a forked tail. When completely developed they leave the body of the snail, swim actively in water, and within 48 hours must find their primary host, man, otherwise they die. Man is infected through the skin of any portion of the body which comes in contact with water containing living cercaria. The latter penetrate the skin, the blood vessels, and finally the veins of the intestinal or urinary tracts.

Other Worms.—The hookworms (*Ankylostoma duodenale* and *Necator americanus*) live attached by their widely open mouths to the wall of the intestine of man. The females lay numerous eggs, which are expelled with the excrement. Development takes place outside the host. Small larvae hatch from the eggs, and become infective. Infection of man takes place through any portion of the skin which comes in contact with this larval stage.

Trichinella spiralis is a small worm parasitic in man, pigs, rats, and other mammals. In the adult stage the worm is an intestinal parasite of the host. The female with ripe eggs does not remain in the lumen, but penetrates into the walls of the intestine, and there lays a great number of embryos. The latter become disseminated throughout the body, penetrate into muscle fibres and form cysts or capsules. Man becomes infected by eating raw infected pork; and pigs or rats become infected by eating the remains of other infected pigs or rats. When taken into the intestine of the new host, the capsules are digested, the small worms are liberated, and grow into male and female Trichinellas.

Filaria bancrofti is a round worm, the adult stages of which live in the lymphatic glands and ducts of man. The female is viviparous and lays an enormous number of embryos, which pass into the circulatory blood system. At regular intervals during the night, these embryos appear in the peripheral blood vessels. They become very numerous from about midnight to 1 A.M. and then gradually disappear, to reappear the following night. The parasite is transmitted from man to man by a night biting mosquito. The latter while sucking blood of an infected man, takes up the embryos, which perforate the mosquito's gut, migrate into its wing muscles, grow, leave the muscles and migrate into various parts of its body. When man is bitten by the infected mosquito, the parasites rupture its proboscis, penetrate through the skin of man to the lymphatics where they grow into male and female Filarias.

Arthropods.—The life history of parasitic Arthropods and especially their relationship with the host, is much simpler. All the blood-sucking insects are only intermittent parasites, others remain for a longer period in contact with their host, but do not penetrate deeply into its tissues. There are, however, examples, such as the ripe female of the chigger flea (*Sarcopsylla penetrans*), which penetrate deeply into the skin of man. A parasitic mite (*Sarcoptes scabiei*) forms superficial galleries in the skin. The larvae of flies such as *Cordylobia anthropophaga* and *Dermatobia hominis* form much deeper galleries and swellings under the skin. Instead of ovipositing directly upon the host, *Dermatobia* fixes its eggs on the body of mosquitoes or other insects. When the latter visit the host, the larvae hatch out from the eggs and penetrate the skin.

Influence of Parasite upon the Host.—The effect produced by parasites upon their host is not always in proportion to the size or the numbers of parasites. The latter may be very numerous without producing serious damage. A black stork, for instance, harbouring several hundreds of worms of six different genera invading the lungs, trachea, oesophagus, stomach and intestine did not show any signs of distress. In an apparently healthy two-year-old horse were found several thousand helminths belonging to seven different genera. A rat heavily infected with *Trypanosoma lewisi* may show no symptoms of infection. On the other hand, a man dying from African sleeping sickness produced by *Trypanosoma gambiense* shows very few parasites in his blood, and the same applies to animals dying from the "nagana" disease caused by *Trypanosoma brucei*. In man, bacterial infections are usually responsible for acute disease, which, when overcome, ends in the complete recovery of the host and the disappearance of the parasites. The host, moreover, often acquires properties protecting him from further attack by the same kind of parasite. Animal parasites, on the contrary, cause a chronic disease which gradually undermines the health and considerably lowers the vitality of the host. The mechanism of the action of parasites varies with the species of parasite and with its localization in the host. The action may be purely mechanical, consisting in the blocking of some channels, ducts or vessels. This is the case in malignant malaria, where the parasites have a tendency to clog together and obliterate the blood capillaries of the brain and of other organs. Other parasites destroy the cells of their host, as is the case with the malarial parasites which live upon the red blood corpuscles. The same applies to the intercellular stages of *Coccidia*, *Leishmania* and other Protozoa, as well as to the spined eggs of the Bilharzial parasites migrating through the tissues of the host. Animal parasites often liberate substances which are distinctly toxic to the host. The severe anaemia of man infected with hook-

worm and other intestinal worms is due to the absorption of toxic substances produced by these worms. In some cases parasites are known to produce more or less pronounced castration of their host. The sexual glands of the latter become atrophied and the host often acquires the secondary sexual characters of the opposite sex. Striking examples of parasitic castration are shown by crabs harbouring *Sacculina* and by wasps attacked by *Stylops.*

The Reaction of the Host.—The mechanism of the reaction of the host naturally varies with the host, the parasite, and the localization of the latter within the body of the host. These reactions can, however, be separated into two main categories: (1) cellular or tissue reactions; and (2) humoral reactions.

(1) The simplest and most widely distributed reaction of the host against the parasite is directed by phagocytes, or the white cells of the blood, which are capable of taking up and digesting small parasites. They can also surround a larger parasite and form several layers of cells around its body. Other cells of the tissues often surround the parasites forming thick cysts or capsules, which separate them more or less completely from the rest of the host's body. Inside these capsules or cysts, the parasites often undergo degeneration, and sometimes even calcification (*Cysticerci, Trichinella*). The cellular reaction may ultimately cause dangerous complications of the disease Bilharziasis. In rats infected with a small round worm, *Gongylonema neoplasticum* (from cockroaches), the cellular reaction which develops around the worm gives rise to a malignant tumour of the tongue or the stomach.

(2) Humoral reaction (*see* IMMUNITY) consists in a special alteration in the body of the parasitized host, which becomes insusceptible to infective disease (acquired immunity). It consists in the development of substances (antibodies) in organisms recovering from infectious diseases, especially if the latter are produced by an infective agent (antigen) such as bacteria and some spirochaetes. Immunity is less frequent and seldom complete when the disease is caused by animal parasites. It is known, however, in the infections produced by *Leishmania* (oriental sore), piroplasms, the parasites of malaria and sleeping sickness, and to some extent in cases of infection with various helminths.

Treatment and Preventative Measures.—A man suffering from a disease produced by a parasite may recover simply through an antiparasitic reaction of his body. Recovery is hastened, however, and is made more certain when the host undergoes treatment. The latter may be purely surgical, and consist in the removal of the parasites from not easily accessible parts of the body (hydatid cyst). In the majority of cases treatment is medical and consists in (1) chemotherapy or destruction of the parasite by specific chemical compounds or drugs, (2) immune therapy or introduction of the antitoxin or anti-bacteria immune sera, which destroy the parasites; or in the introduction of vaccines which help to stimulate the mechanism of natural reactions of the host

The knowledge of the life history of parasites is of paramount importance to man, as it reveals the weak points in their development and adaptations and shows the manner in which infection can be avoided and the parasites attacked and eradicated. The preventive measures directed against parasites fall into three categories: (1) measures against the dissemination of parasites from the infected host; (2) destruction of parasites inside and outside the host together with destruction of secondary hosts or vectors; and (3) measures to avoid infection.

(1) Dissemination of parasites such as *Entamoeba,* schistosomes, tapeworms, hookworms and other intestinal forms as well as bacteria causing cholera and typhoid, can be prevented by avoiding the pollution of soil and water by animals and man harbouring the parasites. Dissemination of parasites causing yellow fever, malaria, sleeping sickness and filariasis is prevented by protecting the infected hosts from the bites of blood-sucking insects which are the potential carriers of infection.

(2) Destruction of parasites inside the host, which can be attained by drugs and other treatment, not only cures the host but also diminishes the chances of dissemination of the parasites. The latter can also be attacked outside the body of the host, directly in their free stages, or indirectly by attacking the intermediate hosts such as the fresh-water snail in Bilharziasis, and the blood-sucking insects in yellow fever, sleeping sickness and malaria.

(3) Measures to avoid infection naturally vary with the parasite involved. Infection with *Trichinella,* tapeworms and other intestinal parasites, is easily prevented by food inspection and by the thorough cooking of suspected food. Infection with guinea worm is prevented by drinking only filtered water; and boiling all water and vegetables is preventative against such diseases as cholera, typhoid and dysentery Infection with hookworm and Bilharziasis can be avoided by protecting the skin from contact with contaminated soil or water. Malaria, yellow fever and sleeping sickness, can be avoided by protection from the bites of the blood-sucking insects which carry these diseases

Parasites as Agents Beneficial to Man.—Many parasites are distinctly detrimental to man himself or to the animals or plants on which he depends; others are of no economic importance to him; but there are also forms which may be beneficial. They may be considered under the following headings:

(1) *The utilization of parasites as therapeutic agents* is based upon the fact that acute attacks of fever are often beneficial to a host suffering from chronic and fatal disease. It has been found that general paralysis in man (caused by the spirochaete of syphilis) subsides when the host is artificially inoculated with spirochaetes of relapsing fever or with malarial parasites.

(2) *Biological control of injurious organisms by means of parasites.* Parasites play an important rôle in nature in checking the increase of numerous species of animals and plants which possess a great power of reproduction. The importance of parasites in attacking organisms detrimental to man has been recognized only in recent years. It has been found possible to protect these parasites, to cultivate them, to transfer them from one region to another, and to use them as a powerful weapon directed against organisms harmful to man. A striking example of biological control by means of parasites of an injurious insect is afforded by the Hawaiian sugar cane leaf-hopper (*see* ENTOMOLOGY)

(3) *Caprification or pollination of fig flowers by parasites.* It is known that in the Smyrna variety of fig the receptacles contain only female flowers and pollination is brought about by a small gall forming insect (*Blastophaga*) which is parasitic in the wild caprifigs containing both male and female flowers.

(4) *Parasites causing the formation of pearls.* Pearls are formed as a reaction of the mantle epithelium of the oyster around some foreign body which acts as an irritant. In most cases the foreign body which stimulates the formation of the pearl is the larval stage of a parasitic worm. Thus, "The most beautiful pearl is nothing else but a brilliant sarcophagus of a worm" (Dubois).

(5) *Useful products and substances of commercial value produced by parasites.* Scale insects or Coccids, which live as parasites upon a great variety of plants, are responsible for the production of several substances of commercial value, such as cochineal dyestuff, the stick-lac (*see* LAC) from which shellac and a red "lac dye" are prepared, and the objects called "ground pearls" (*q.v*).

Parasitism in the Past and Present Time.—Parasitism cannot be considered as a mode of life only recently acquired by various organisms. Although parasites, owing to their adaptation, could hardly develop characters favourable for fossilization, a number of remains have been found revealing the existence of parasitism in very old geological periods. There is some evidence that bacteria already existed in the pre-Cambrian period Parasitic or "spot" fungi have been found in the remains of plants in as early as Carboniferous time. Fossil specimens of *Rhinoceros* show evidence of infection with *Actinomyces* (lumpy jaw). Parasitism of sea snails (Gastropods) upon sea-lilies (Crinoids) began in Silurian, became common in Devonian and reached a climax in the Carboniferous period. Insect galleries and galls have been found in plants from Cretaceous and Tertiary rocks. It is quite possible that parasites also played an important rôle in the extinction of several forms of mammals. Tse-tse flies (*Glossina*) which transmit *Trypanosoma brucei* causing the "nagana" disease in mammals, in early Tertiary times were much more widely distributed and even reached the region of Colorado.

Man from very early times probably suffered from most of the parasitic diseases from which he suffers now Calcified eggs

of Bilharzial parasites have been found in the kidneys of Egyptian mummies of the 20th Dynasty (about 1,200 B.C.); that is in the country in which Bilharziasis is so very common now. Tuberculosis in the form of Pott's disease was also found in a mummy of the priest of Ammon from an Egyptian cemetery dating from the 21st dynasty—1,100 B.C. Parasitic diseases have undoubtedly played an important rôle in the history of man. They undermined his health, lowered and dissipated his energy, reduced or destroyed the stock of animals and plants upon which he depended, and were often the direct cause of enormous losses of human life.. Such diseases, especially malaria and hookworm, were in a great measure responsible for the disappearance of many human tribes, and for the fall of many very highly civilized empires. They played an important part in the history of military conquest as well as in the history of the commercial expansion of man. As recently as the 14th century Europe was swept by epidemics of plague which destroyed a quarter of the population. Parasites have hindered several human efforts in modern times. Thus, the construction of the St. Gothard tunnel was seriously hampered by hookworm disease; and the first enterprise of the construction of the Panama canal failed utterly after great loss of life from malaria and yellow fever. It was only when these diseases had been conquered in the Panama zone that the work could be brought to a successful conclusion. (*See* also PESTS.)

PARASNATH, a hill and place of Jain pilgrimage in British India, in Hazaribagh district, Behar and Orissa; 4,480 ft. above the sea; 18 m. from Giridih station on the East Indian railway. It derives its name from the last of the twenty-four Jain saints, who is believed to have attained here the *nirvana*.

PARATHYROID: *see* DUCTLESS GLAND; SPRUE.

PARATYPHOID FEVER is the name given to a set of intestinal diseases clinically very like typhoid fever and caused by specific organisms akin to the bacillus typhosus. Three distinct organisms have been identified as causing these diseases and they have been designated as bacillus paratyphosus "A," "B" and "C," and the fevers they cause are therefore known as paratyphoid "A," "B" and "C" respectively.

All three paratyphoid organisms can be distinguished from B. typhosus by biochemical tests and B. paratyphosus "A" can be distinguished from "B" and "C" by the same means, but for the identification of the last two organisms serological methods have to be employed. The biochemical substances used in differentiating these organisms from one another are the sugars, glucose, mannite and dulcite, dissolved in a broth medium, and milk. B. typhosus produces acid in glucose and mannite whereas the paratyphoid organisms produce acid and gas in all three sugars. Again B. paratyphosus "A" turns milk acid, whilst the other paratyphoid organisms turn it first acid and then alkaline.

The anatomical lesions in the paratyphoid fevers resemble those found in typhoid fever and chiefly consist of inflammation and ulceration of the lymphoid tissue of the intestinal canal, especially in the lower part of the small intestine, and of the enlargement of the spleen and mesenteric glands. In paratyphoid "B" fever the ulceration often spreads into the large intestine.

The symptoms of the paratyphoid fevers are generally those of a mild form of typhoid fever, the only difference being one of degree, but it must be remembered that they may be just as severe and followed by the same complications as typhoid.

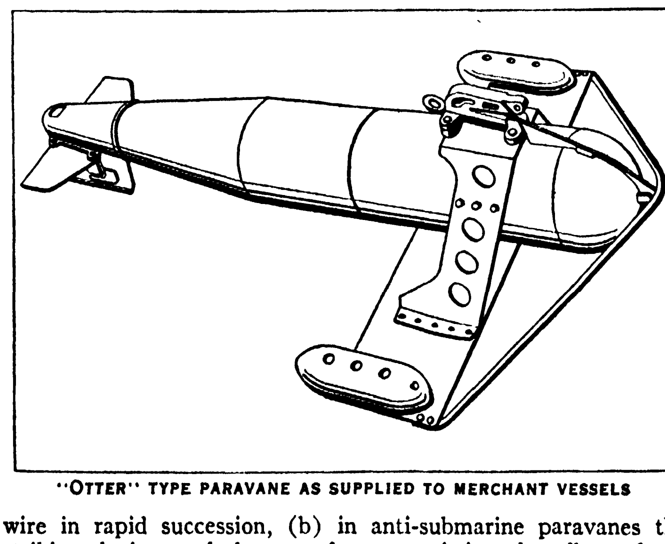
The incubation period averages between 5 and 21 days and the onset of the disease causes lassitude, headache, nose bleeding, pain in the back with sometimes a shivering fit and a sudden rise of temperature. Early and well marked gastro-intestinal symptoms, such as diarrhoea and vomiting, suggest a paratyphoid "B" infection. The characteristic "rose spots" of typhoid fever are not always present but on the other hand they may be very plentiful and by no means confined to the abdomen but spread over the neck, face and arms. They may also be very much larger than the usual rose spots and resemble the rash of measles. The mental condition, when impaired, may vary between dulness and delirium, according to the severity of the disease. The temperature often reaches its highest point shortly after the onset of the disease in contradistinction to the gradual rise in typhoid fever. It is usually of shorter duration, more irregular, and may return to normal suddenly instead of gradually as in typhoid fever. The pulse is slow and follows the variations of the temperature.

Diarrhoea is a fairly constant symptom and the stools resemble pea soup, have a putrid smell and may contain fragments from the inner coat of the intestine. Fresh blood may also be seen in the stools due to the erosion of a blood vessel in one of the intestinal ulcers. Ulceration may proceed so far as to cause a perforation into the abdominal cavity which leads to local or general peritonitis. The average time during which active symptoms of the disease are present is from 9 to 14 days. The complications of paratyphoid fever are those of typhoid fever though there is a greater tendency towards abscess formation in the former.

It should be possible to isolate the causal organisms, at one stage of the disease or another, from the blood, the urine and the stools and it is the persistence of the organisms in the latter situations which produces the paratyphoid carrier. The treatment of paratyphoid fever is identical with that of typhoid fever. Partial protection against the paratyphoid fevers can be obtained by anti-paratyphoid inoculation but the specific organism must be used in making the vaccine. In practice a combined vaccine is used which includes the paratyphoid and the typhoid organisms. (For Bibliography *see* TYPHOID FEVER.) (N. T. W.)

PARAVANE, THE, is a type of underwater kite which was developed by Lieutenant (now Lieut.-Commander, retired) C. D. Burney, R.N., during the World War as an anti-submarine and anti-mine weapon. It consists essentially of a torpedo-shaped buoyant body towed by a wire from a ship and carrying a plane which from the motion of the ship through the water gives the necessary thrust to cause the paravane to stand out a considerable lateral distance from the ship's side. It is fitted with a rudder to keep it at a pre-arranged depth below the surface, the rudder being governed by a hydrostatic valve and an oscillator.

The paravane is divided into three parts, namely: (1) head; (2) body; (3) tail. The head carries a tow anchorage, plane and (a) in anti-mine paravanes, the cutter, which requires no setting and can cut successive parts of a mine mooring of $1\frac{1}{2}$in.

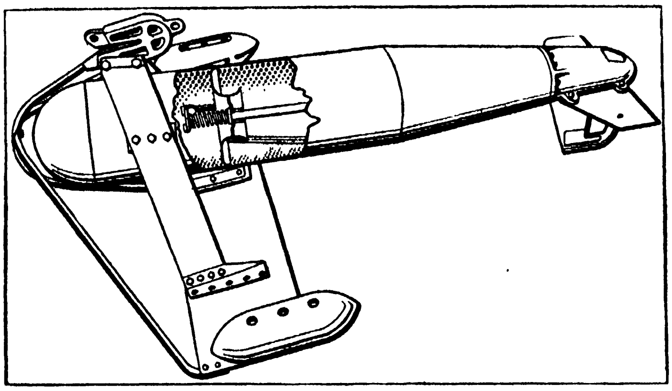


"OTTER" TYPE PARAVANE AS SUPPLIED TO MERCHANT VESSELS

wire in rapid succession, (b) in anti-submarine paravanes the striking device, and the gear for transmitting the effect of the impact to the striker-switch.

The body is watertight and is made of welded steel plate. (a) In the anti-submarine paravane the body carries within it the charge of T.N.T., the primer tin and the detonating gear. Whilst the paravane is on board or in close proximity to the ship the detonators are withdrawn from the primer and two safety shutters form an effective fire screen between the two. At a speed greater than about 10 knots, a water flap, which projects from the

under side of the paravane, is forced aft by the water pressure upon it. This movement is transmitted to the detonator carriage, which moves aft, forcing the safety shutters to one side and placing the detonators in position in the primer ready for firing. The body also carries the striker-switch and depth-recording gear. The depth-recording gear registers on the attacking vessel the depth at which the paravane is running. (b) In the case of the anti-



"OTTER" TYPE PARAVANE, SHOWING DEPTH CONTROL ARRANGEMENTS

mine paravane the body contains the oscillator. The depth-keeping mechanism in the paravane is composed of two distinct portions, the hydrostatic valve and the mercury oscillator. The hydrostatic valve depends, for its action, on a change of depth above or below the normal depth. It therefore causes the paravane to follow a sinusoidal path through the water. At high speeds this motion becomes excessive and a device is required which will return the paravane to its correct position as soon as it is inclined to move from its set depth. This function is performed by the oscillator. When a paravane is fitted with this gear, the depth at which it runs does not vary more than 4ft. on either side of the set depth.

The tail of the paravane carries the two rudders, the hydrostatic valve which actuates them, and the horizontal and vertical fins. The paravane being required to run at a certain depth, a compression corresponding to this depth is put upon the hydrostatic valve spring. The load due to this compression forces the rudders "down"; the water pressure acting on the hydrostatic valve tends to force the rudders "up"; when the two balance, the rudders return to the amidships position.

Protector Paravanes.—Paravanes for anti-mine use are known as Protector paravanes. The installation is designed to protect ships from moored mines. A paravane is towed on either side of the vessel, by means of a length of special wire. Due to the position taken up by the paravanes, the wires form a wedge on either side of the ship, and sweep through a broad path. If they foul the mooring wire of a mine, the mine is deflected away from the path of the vessel, and the mooring wire slips along the paravane wire until it reaches the paravane. There it is severed by the cutter fitted on the head and the mine rises to the surface, where it can be seen and destroyed. The towing wire is attached to the vessel by a specially designed fitting situated at the point of intersection of the stem and keel. When the towing wire fouls a mine mooring wire, a minimum outward thrust must be imparted to the mine and sinker in order to deflect them from the path of the vessel. If a paravane be designed to give this minimum thrust whilst moving at a moderate speed through the water, its total thrust when moving at a high speed would be very great, and an excessive load might be thrown upon the towing wire. Broadly speaking, a paravane is designed to protect a vessel at all speeds from about one-third her maximum upwards.

The protection afforded by the paravanes depends, amongst other things, upon the distance between the fore and aft line of the ship and the paravane when running. This distance, or spread, in turn depends upon three things:—(1) the length of the towing wire; (2) the size of the paravane; (3) the size of the towing wire. Also the paravanes must be attached to the ship as far forward and as low down as practicable. If the point of attachment were above the level of the keel, mines could pass under the towing wire and hit the ship. Further, the paravanes should not tow at any considerable depth below the keel. They are usually set to run at a depth about 5ft. in excess of the deepest draught of the vessel. Any mine within the sweep of the paravanes, which lies between the line of keel and the surface of the sea, will then be deflected by the towing wire. If a mine be moored so deeply that it passes under the towing wire, it cannot, under ordinary circumstances, strike the ship in calm water.

As already described, an effective paravane will deflect any mine from the path of a vessel which is on a straight course, but it is conceivable that, whilst a vessel is turning, a mine may be missed by the paravane and yet hit the ship near the stern. For relatively small ships, up to 400ft. in length, one pair of paravanes gives practically complete immunity from moored mines as long as the ship is not in a heavy sea. With larger ships, the distance swept out by the vessel when turning under full helm may be so great that one pair of paravanes does not give adequate protection.

Explosive Paravanes.—A considerable amount of auxiliary apparatus is required in connection with explosive paravanes, the whole installation being called the "high speed submarine sweep." It enables a vessel to attack a submerged hostile submarine whose position is only approximately known. The sweep consists essentially of a paravane, towed astern of the attacking vessel, and containing an explosive charge fired electrically by means of a dynamo fitted in the vessel. It is towed from a winch, by armoured electric cables led over a fairlead in the stern of the attacking vessel. When the towing wire fouls a submerged submarine it will slip over her smooth surface until the submarine is struck by the paravane. The striking gear which is fitted to the nose of the paravane is moved inwards by the impact, actuates a firing switch and detonates the charge. Alternatively, if the nose of the paravane does not strike the submarine, the wire may be caught or nipped over some part of the submarine, thus increasing the load on the wire. This increased load trips a dynamometer switch which again detonates the charge. A third method of firing, by a hand switch on the attacking vessel, is fitted in case it is desired to get rid of the paravane in an emergency. The principal advantages of this type of sweep are that it can be towed at high speeds and it leaves unaffected the manoeuvring powers of attacking vessels.

(A. H. W.)

PARAZOA, the name sometimes used in zoology to denote the grade of organization represented by the sponges (*q.v.*), in contradistinction to Protozoa and Metazoa (*qq.v.*).

PARCEL POST: *see* Post and Postal Services.

PARCENARY: *see* Co-parcenary.

PARCHIM or **PARCHEM,** a town of Germany, in the republic of Mecklenburg-Schwerin, on the Elde, 23 m. S.E. of Schwerin, on the railway from Ludwigslust to Neubrandenburg. Pop. (1925) 11,217. Founded about 1210, Parchim was during part of the 14th century the residence of one branch of the family of the dukes of Mecklenburg. It became a prosperous industrial town during the 16th century, but this prosperity was destroyed by the Thirty Years' War. It is a walled town, with a Gothic town hall. Here Moltke was born. It now manufactures machinery, cloth, chicory and cigars, and is a gardening centre.

PARCHMENT. Skins of certain animals, prepared after particular methods, have supplied writing material on which has been inscribed the literature of centuries. The preparation of such skins, in a manner which gave the material the name it possesses to-day (περγαμηνή, Lat. *charta pergamena,* Fr. *parchemin*) was traditionally attributed to Eumenes II. of Pergamum, 197–158 B.C.

The principal improvement in the new manufacture was the dressing of the skins in such a way as to render them capable of receiving writing on both sides, the older methods probably treating only one side for the purpose, a practice which was sufficient in times when the roll was the ordinary form of book and when it was not customary to write on the back as well as on the face of the material. The invention of parchment, with its two surfaces, ensured the development of the codex.

The animals whose skins were found appropriate for the manufacture of the new parchment were chiefly sheep, goats and calves.

But in the course of time there has arisen a distinction between the coarser and finer qualities of the material; and while parchment made from ordinary skins of sheep and goats continued to bear the name, the finer kinds of manufacture produced from the more delicate skins of the calf or kid, or of still-born or newly-born calves or lambs, came to be generally known as vellum (Fr. *velin*). The skin codices of the early and middle ages being for the most part composed of the finer kinds of material, it has become the custom to describe them as of vellum, although in some instances it would be more correct to call the material parchment.

The ordinary modern process of preparing the skins is by washing, liming, unhairing, scraping, washing a second time, stretching evenly on a frame, scraping a second time and paring down inequalities, dusting with sifted chalk and rubbing with pumice. Similar methods must have been employed from the first.

The comparatively large number of ancient and mediaeval mss. that have survived enables us to gather some knowledge of the varieties of the material in different periods and in different countries. We know from references in Roman authors that parchment or vellum was entering into competition with papyrus as a writing material as early as the 2nd century A.D. (*see* ILLUMINATED MANUSCRIPT), though at that time it was probably not so skilfully prepared as to be a dangerous rival. But the surviving examples of the 3rd and 4th centuries show that a rapid improvement must almost at once have been effected, for the vellum of that age is generally of a thin and delicate texture, firm and crisp, smooth and glossy. There was always a difference in colour between the surface of the skin from which the hair had been removed and the surface next to the flesh of the animal, the latter being whiter than the other. This difference is generally more noticeable in the older examples, those of a later period having usually been treated more thoroughly with chalk and pumice. To obviate any unsightly contrast, it was customary, when making up the quires for a volume, to lay hair-side next to hair-side and flesh-side to flesh-side, so that, at whatever place the codex was opened, the tint of the open pages should be uniform.

As a rule, the vellum of early mss., down to and including the 6th century, is of good quality and well prepared. After this, the demand increasing, a greater amount of inferior material came into the market. The manufacture necessarily varied in different countries. In Ireland and England the vellum of the early mss. is usually of a stouter quality than that of foreign examples. In Italy and Greece and in the European countries generally bordering on the Mediterranean, a highly polished surface came into favour in the middle ages, with the ill effect that the hardness of the material resisted absorption, and that there was always a tendency for ink and paint to flake off. On the other hand, in western Europe a soft pliant vellum was in vogue for the better classes of mss., from the 12th century onwards. In the Italian Renaissance a material of extreme whiteness was affected.

Examples of uterine vellum, prepared from still-born or newly-born young, are met with in choice volumes. A remarkable instance of a codex composed of this delicate substance is the Additional MS. 23935, of the 13th and 14th centuries, in the British Museum, which is made up of as many as 579 leaves, without being a volume of abnormal bulk.

In conclusion, we must briefly notice the employment of vellum of a sumptuous character to add splendour to specially choice codices of the early middle ages. The art of dyeing the material with a rich purple colour was practised both in Constantinople and in Rome; and, at least as far back as the 3rd century, mss., generally of the Scriptures, were produced written in silver and gold on the precious stained vellum; a useless luxury, denounced by St. Jerome in a well-known passage in his preface to the Book of Job. A certain number of early examples still survive, in a more or less perfect condition: such as the mss. of the Gospels in the Old Latin version at Verona of the 4th or 5th century; the celebrated codex of Genesis in the Imperial Library at Vienna; the Rossano ms. and the Patmos ms. of the Gospels in Greek; the Gothic Gospels of Ulfilas at Uppsala, and others of the 6th century, besides a few somewhat later specimens. In the revival of learning under Charlemagne a further encouragement was given to the production of such codices; but soon afterwards the art of purple-staining appears to have been lost or abandoned. A last trace of it is found in a few instances of stained vellum leaves inserted for ornament in mss. of the period of the Renaissance.

PARDO BAZÁN, EMILIA (1851–1921), Spanish author, was born at Corunna. Her first novel, *Pascual López* (1879), was a simple exercise in fantasy of no remarkable promise; it was followed by a more striking story, *Un Viaje de novios* (1881), in which a discreet attempt was made to introduce into Spain the methods of French realism. The sensation caused by this book among the literary cliques was increased by the appearance of another naturalistic tale, *La Tribuna* (1885), wherein the influence of Zola is unmistakable. Meanwhile, the writer's reply to her critics was issued under the title of *La Cuestión palpitante* (1883), a clever piece of rhetoric, but of no especial value as regards criticism or dialectics. Probably the best of Emilia Pardo Bazán's work is embodied in *Los Pazos de Ulloa* (1886), the painfully exact history of a decadent aristocratic family, as notable for its portraits of types like Nucha and Julián as for its creation of characters like those of the political bravos, Barbacana and Trampeta. Yet perhaps its most abiding merit lies in its pictures of country life, its poetic realization of Galician scenery set down in an elaborate, highly-coloured style, which, if not always academically correct, is invariably effective. A sequel, with the significant title of *La Madre naturaleza* (1887), marks a further advance in the path of naturalism, and henceforward Emilia Pardo Bazán was universally recognized as one of the chiefs of the new naturalistic movement in Spain. The title was confirmed by the publication of *Insolación* and *Morriña*, both issued in 1889. In this year her reputation as a novelist reached its highest point. Her later stories, *La Cristiana* (1890), *Cuentos de amor* (1894), *Arco Iris* (1895), *Misterio* (1903), *La Quimera* (1905), *Dulce Dueño* (1911), and *Cuentos de la Tierra* (1922), though not wanting in charm, awakened less interest.

PARDON, the remission, by the power entrusted with the execution of the laws, of the penalty attached to a crime. The right of pardoning is coextensive with the right of punishing. In practice the prerogative is extremely valuable, when used with discretion, as a means of adjusting the different degrees of moral guilt in crimes or of rectifying a miscarriage of justice. By the law of England pardon is the sole prerogative of the king, and it is declared by 27 Hen. VIII. c. 24 that no other person has power to pardon or remit any treasons or felonies whatsoever. This is a position that is based on the theory of English law that all offences are breaches of the king's peace. Thus, the Crown by pardon only remits the penalty for an attack upon itself. The prerogative is in modern times exercised by delegation, the Crown acting upon the representation of the secretary of State for the home department in England and the secretary for Scotland in that country. The prerogative of the Crown is subject to some restrictions: (1) The committing of a subject of the realm to a prison out of the realm is by the Habeas Corpus Act a *praemunire*, unpardonable even by the king (31 Car. II. c. 2, s. 12). (2) The king cannot pardon an offence in a matter of private rather than of public wrong, so as to prejudice the person injured by the offence. Thus a common nuisance cannot be pardoned while it remains unredressed, or so as to prevent an abatement of it. A fine or penalty imposed for the offence may, however, be remitted. (3) The king's pardon cannot be pleaded in bar of an impeachment. This principle, first asserted by a resolution of the House of Commons in the earl of Danby's case (May 5, 1679), forms one of the provisions of the Act of Settlement, 12 and 13 Will. III. c. 2.

Pardon may be actual, conditional or constructive. Actual pardon is by warrant under the great seal, or under the sign-manual countersigned by a secretary of State (7 and 8 Geo. IV. c. 28, s. 13). Constructive pardon is obtained by endurance of

the punishment. By 9 Geo. IV. c. 32, s. 3, the endurance of a punishment on conviction of a felony not capital has the same effect as a pardon under the great seal. Further, pardon may be free or conditional. A conditional pardon most commonly occurs where an offender sentenced to death has his sentence commuted to penal servitude or any less punishment. But it of course applies to other cases (*see* Criminal Law Act 1827, s. 13, and Children Act 1908, s. 84). The condition of his pardon is the endurance by him of the substituted punishment. The effect of a free pardon, whether actual or constructive, is to put the person pardoned in the position of an innocent man; he may have an action against any one thenceforth calling him traitor or felon.

It is obvious that, though the Crown is invested with the right to pardon, this does not prevent pardon being granted by the higher authority of an Act of parliament. Acts of indemnity have frequently been passed, the effect of which is the same as pardon or remission by the Crown. Civil rights are not divested by pardon. The person injured may have a right of action against the offender in spite of the pardon of the latter, if the right of action has once vested, for the Crown cannot affect private rights.

In the United States, the president has authority to pardon all offences against the Government except in case of impeachment. In the States, the governor has the authority, usually acting upon recommendation of a board of pardons, or, as in New Jersey, as a member himself of the board of pardons. In the States, a pardon generally is necessary to restore to a person convicted of a felony and in some cases a misdemeanour, his political rights of voting and holding public office.

PAREJA, JUAN DE (1606–1670), Spanish painter, was born a slave in the West Indies about 1606, and in early life passed into the service of Velasquez, who employed him in colour-grinding and other work of the studio. By day he closely watched his master's methods, and by night stealthily practised with his brushes until he had attained considerable skill. The story goes that, having succeeded in producing a picture satisfactory to himself, he contrived furtively to place it among those on which Velasquez had been working, immediately before an expected visit of King Philip IV. The performance was duly discovered and praised, and Pareja forthwith received his freedom, which, however, he continued to devote to his former employer's service. His best known work is the "Calling of St. Matthew," in the Prado, Madrid. Velasquez took Pareja with him to Rome and painted his portrait (now at Longford Castle).

PARENT, SIMON NAPOLEON (1855–1920), Canadian politician, son of Simon Polycarpe Parent, merchant, was born in the village of Beauport, in the province of Quebec, on Sept. 12, 1855. He was educated at Laval university, where he graduated in 1881. In the same year he was called to the bar of the province of Quebec. Parent was mayor of Quebec from 1894 to 1906. From the year 1890 to 1905 he represented the county of Saint-Sauveur as a Liberal in the Quebec assembly, and was minister of lands in the Marchand administration of 1897. He was prime minister of Quebec from 1900 to 1905, when he became chairman of the Transcontinental railway of Canada. He died in Sept. 1920.

PARENTAL EDUCATION, an organized effort to provide systematic parental training which will insure harmonious and efficient functioning of parent and child in the rapidly changing civilization. (For England *see* SCHOOL AND THE HOME.)

THE UNITED STATES

The movement has grown in the U.S. from scattered groups in the '90s to definite organizations of national proportions. The major programme of agencies engaged in this work is to translate research materials of sociological and biological science into popular terms of use to parents.

The National Congress of Mothers, founded in 1897 by Mrs. Theodore W. Birney, became in 1908 the National Congress of Mothers and Parent-Teacher Associations, and in 1924 the National Congress of Parents and Teachers. It has affiliated branches in all but one State, a membership of over 1,000,000, and committees on every phase of child welfare. Its programme has stressed social contact of parent and teacher, discussion of school problems and, more recently, child study.

The Child Study Association of America had in 1928 124 study groups associated or affiliated, some of which are in China, Japan, Russia, London and Canada. Independently and in co-operation with local groups it conducts annual national conferences on parenthood education. It publishes a magazine, "Child Study." The association inspired the formation of the National Council of Parental Education. The Child Development Committee of the National Research Council (1926) co-ordinates the child welfare research of the various universities. In connection with a study of the pre-school, elementary and adolescent child sponsored by the American Association of University Women, 224 child study groups have been formed. In New York, Boston and Hartford the visiting teacher movement (later the National Association of Visiting Teachers) sprang up almost simultaneously in a direct attempt to serve those parents not reached through the organizations mentioned. The Public Education Association has conducted many experiments and investigations through the visiting teacher, pointing out the significance of family conditions and relationships in forming desirable moral and social responses. The National Committee on Mental Hygiene (1910), searching for the causes of nervous diseases, found unhealthy emotional habits to be the largest factor, and organized child guidance clinics. In 1919 the Progressive Education Association was formed to present to the public efforts being made to adapt education to changing conditions. In 1921, through the initiative of the Parents' Association of the Horace Mann school, Teachers' college, of Columbia university, the United Parents' Associations of Greater New York Schools was formed. Its contribution has been the search for a technique to provide popular parental education in a cosmopolitan, congested centre. It conducted the Parents' Exposition (1928). In 1922 the American Child Health Association evolved from an older organization to continue the interpretation of findings and discoveries of specialists to the lay public. It is assisted by the State Bureau of Infant and Maternity Hygiene, baby clinics and hospital courses for pregnant mothers.

Outstanding work has been done in colleges and universities with nursery schools (*q.v.*) and home management facilities such as the Merrill-Palmer schools, Detroit, Mich., University of Minnesota, University of Chicago, Cornell university, Iowa State college and Vassar college. Many not having nursery schools co-operate with other agencies, as in the case of the University of Cincinnati, which has been aided by the Mothers' Training Centre to form a nursery school where parents observe the play, occupations and methods suited to the pre-school child. In 1926 this movement crystallized in a national organization under Miss Patty Hill.

Other agencies are the American Home Economics Association, founded by Mrs. Ellen H. Richard (1907) to emphasize the significance of home making, and the American Social Hygiene Association (1914), which assists parents to give proper sex instruction. The U.S. Bureau of Education, the Federal Board of Vocational Education, the Federal Children's Bureau and the U.S. Department of Agriculture have made valuable contributions by furnishing lecturers and outlines for reading courses and through study groups. Some municipalities and State departments of education and several private organizations maintain training courses.

Lowrey, *Suggested Further Developments in Education for Parenthood* (1926); U.S. Bureau of Education, "Typical Child Care and Parenthood Education in Home Economics Departments," *Bull. No. 17* (1927); U.S. Bureau of Education, "The Parent-Teacher Association," *Bull. No. 2* (1927). (R. E. St.)

PARENZO, a seaport and episcopal see of Italy, province of Pola, 95 m. S.W. of Trieste by rail. Pop. (1921) 9,288, town; 12,252, commune. It is situated on the west coast of Istria, on a peninsula not more than 5 ft. above the sea-level; and as the pavements of the Roman period are 3 ft. below the present surface it is inferred that this part of the coast is slowly subsiding. The well-preserved cathedral of St. Maurus (543–554) is a basilica

with nave and two aisles. There are a number of Venetian Gothic houses.

Parenzo (Lat. *Parentium*), conquered by the Romans in 178 B.C., still preserves the Roman ground plan, and the small museum is housed in the ruins of a temple. The bishopric was founded in A.D. 524. The city formally recognized Venetian supremacy in 1267, and was in 1354 plundered by Paganino Doria of Genoa.

See Neumann, *Der Dom von Parenzo* (Vienna, 1902).

PARGA, a seaport of southern Epirus, in Greece, on the Ionian Sea. Parga has a rock-built citadel and a harbour formed by a mole which the Venetians constructed in 1572. It exports citrons, wool, oak, bark and skins. It is perhaps the site of the ancient Toryne, a short distance to the west; Parga was removed to its present position after the Turkish invasion in the 15th century. Under Venetian protection, freely accepted in 1401, the inhabitants maintained their municipal independence and commercial prosperity down to the destruction of the Venetian republic in 1797, though on two occasions, in 1500 and 1560, their city was burned by the Turks. The attempts of Ali Pasha of Iannina to make himself master of the place were thwarted partly by the presence of a French garrison in the citadel and partly by the heroic attitude of the Pargiotes themselves, who were anxious to have their city incorporated with the Ionian Republic. To secure their purpose they in 1814 expelled the French garrison and accepted British protection; but the British Government in 1815 determined to go back to the convention of 1800 by which Parga was to be surrendered to Turkey, though no mosque was to be built or Muslim to settle within its territory. Rather than subject themselves to the tyranny of Ali Pasha, the Pargiotes decided to forsake their country; and accordingly in 1819, the majority migrated to the Ionian Islands The Turkish government was constrained to pay them £150,000 by way of compensation. The town has been largely rebuilt since that date.

PARGETTING, a term applied to the decoration in relief of the plastering between the studwork on the outside of half-timber houses, or sometimes covering the whole wall. The devices were stamped on the wet plaster. This seems generally to have been done by sticking a number of pins in a board in certain lines or curves, and then pressing on the wet plaster in various directions, so as to form geometrical figures. Sometimes these devices are in relief, and in the time of Elizabeth represent figures, birds, foliages, etc.; fine examples are to be seen at Ipswich, Maidstone, Newark, etc. The term is also applied to the lining of the inside of smoke flues to form an even surface for the passage of the smoke.

PARHELION or **MOCK SUN,** a spot on a solar halo reflected at various angles near the sun. The most brilliant are situated at the intersections of the inner halo and the parhelic circle, and are particularly brilliant when the sun is setting They are caused by refraction through a pair of alternate faces of a vertical prism. When the sun is on the horizon the rays fall from the principal section of the prisms and the parhelia are therefore not only on the inner halo but also on the parhelic circle. The different values of the angle of minimum deviation for differently coloured rays give rise to most effective colourings. *See* also HALO.

PARIAH, in European usage the name for the outcasts of India but many castes rank below them. The term *paraiyan* probably means "drummer" but it is now almost a generic one and the caste is split up into a number of sub-castes pursuing many avocations generally humble or even criminal but occasionally respectable. As a caste their touch pollutes men of high caste yet they belong to the right-hand faction and their priests actually wear the sacred thread. The Paraiyans would appear to have been either a pre-Dravidian element or a caste depressed in Dravidian times which was closely connected with the soil. It may once have held a better status but its occasional privileges are not inconsistent with an age-long predial serfdom. Its main strength is in the Tamil districts. Nowadays it forms almost a nationality apart, living in its own hamlets but holding them inviolate, asserting its meagre rights, retaining many of its primitive beliefs, yet not uninfluenced by Brahmanism. Paraiyans, once enlisted in Clive's troops, are still recruited for the Madras sappers and miners. Conversion to Christianity has done much for this and the other castes included in the Panchamas or "people of the fifth" caste, whose education has been specially fostered by Government.

See E. Thurston, *Castes and Tribes of S. India*, vi. (1909).

PARIAH DOG, a dog of a domesticated breed that has reverted, in a greater or less degree, to a half-wild condition. Troops of such dogs are found in the towns and villages of Eastern Europe, Asia and Africa; and they probably interbreed with wolves, jackals and wild dogs.

PARIAN CHRONICLE, a marble tablet found in the island of Paros in 1627, now among the Arundel Marbles at Oxford. It originally embraced an outline of Greek history from the reign of Cecrops, legendary king of Athens, down to the archonship of Diognetus at Athens (264 B.C.). The author of the Chronicle has given much attention to the festivals, and to poetry and music; thus he has recorded the dates of the establishment of festivals, of the introduction of various kinds of poetry, the births and deaths of the poets, and their victories in contests of poetical skill. Important political and military events are often omitted. The years are reckoned backwards from the archonship of Diognetus, and further specified by the kings and archons of Athens The Chronicle consists of 93 lines in the Attic dialect.

BIBLIOGRAPHY.—The Parian Chronicle is printed by A Böckh in the *Corpus inscriptionum graecarum*, vol. ii. No. 2,374, and by C. W. Müller in the *Fragmenta historicorum graecorum*, vol. i., and edited by F. Jacoby (1904). A new fragment was discovered in 1897 (edit. Crispi and Wilhelm in *Mittheilungen des archaeologischen Instituts, athenische Abtheilung*, vol. xxii., 1897). *See* also "Notes on the Text of the Parian Marble," etc., by J. A. R. Munro, in *Classical Review* (March and Oct. 1901 and June 1905).

PARI MUTUEL: *see* TOTALIZATOR

PARINI, GIUSEPPE (1729–1799), Italian poet, was born at Bosisio in the Milanese, on May 22, 1729 His parents, who possessed a small farm on the shore of Lake Pusiano, sent him to Milan, where he studied under the Barnabites in the Academy Arcimboldi, maintaining himself latterly by copying manuscripts. In 1752 he published at Lugano, under the pseudonym of Ripano Eupilino, a small volume of *sciolto* verse which secured his election to the Accademia dei Trasformati at Milan and to that of the Arcadi at Rome. In 1754 poverty drove him to take priest's orders, and he then obtained a place as tutor. *Il Mattino* (1763), the first part of his *Il Giorno,* gives ironical instructions to a young nobleman as to the best method of spending his mornings It at once established Parini's fame, and two years later there followed *Il Mezzogiorno*. The Austrian plenipotentiary, Count Firmian, appointed him editor of the Milan *Gazette,* and in 1769 to a specially created chair of belles lettres in the Palatine School. Parini hoped for great things from the French Revolution, and on the French occupation of Milan he was appointed magistrate by Napoleon and Saliceti. Three years later he was dismissed. He then completed *Il Vespro* and *La Notte* (published after his death), which with the two other poems already mentioned compose *Il Giorno.* The score of *Odi,* composed between 1757 and 1795, are among the classics of Italian poetry. Parini's scorn for the aristocratic society of his day and his independent character induced de Sanctis to speak of him as "the first man of the new Italy" He died at Milan on Aug 15, 1799.

See editions of Parini's *Opere* by Reina (6 vols., Milan, 1801–04), and by Mazzoni (Florence, 1897). *See* also F de Sanctis, *Nuovi Saggi Critici* (1872); and Carducci, *Studi su G. Parini* in vol. xiii. & xiv. of his *Opere*.

PARIS (also called ALEXANDROS, *i.e.,* "champion"), the son of Priam and Hecuba, who dreamed that she was delivered of a firebrand. The dream was interpreted that her child would ruin his country, and when Paris was born he was exposed on Mt. Ida. His life was saved by the herdsmen, and he grew up among them, till he was recognized and received by his parents. When the strife arose between Hera, Athena, and Aphrodite (*see* ERIS) Paris was selected as the judge. Each tried to bribe him, Hera promising power, Athena wisdom, Aphrodite the most beautiful woman in the world. Paris decided in favour of Aphrodite, and thus made

Hera and Athena bitter enemies of his country. Paris now set sail for Lacedaemon, deserting his old love Oenone, daughter of the river-god Cebren. In Menelaus' absence he carried off Helen; thereupon followed the siege of Troy, during which Paris, although inferior to Hector, fought well enough, slaying Achilles (*q.v.*) by the help of Apollo. Before the capture of the city he was mortally wounded by Philoctetes with an arrow. He then bethought him of Oenone, who he knew could heal the wound. She refused to save him, but when he died she committed suicide. The judgment of Paris became a favourite subject in Greek art.

PARIS, ALEXIS PAULIN (1800–1881), French *savant,* was born at Avenay (Marne) on the 25th of March, 1800. He published in 1824 an *Apologie pour l'école romantique,* and took an active part in Parisian journalism. His appointment, in 1828, to the department of manuscripts in the Bibliothèque royale left him leisure to pursue his studies in mediaeval French literature. Paulin Paris lived before minute methods of research had been generally applied to modern literature, and his chief merit is that by his numerous editions of early French poems he continued the work begun by Dominique Méon in arousing general interest in the then little-known epics of chivalry. Admitted to the Académie des Inscriptions et Belles Lettres in 1837, he was shortly afterwards appointed on the commission entrusted with the continuation of the *Histoire littéraire de la France*. In 1853 a chair of mediaeval literature was founded at the Collège de France, and Paulin Paris became the first occupant. He retired in 1872 with the title of honorary professor, and was promoted officer of the Legion of Honour in the next year. He died on the 13th of February 1881 in Paris.

His works include: *Manuscrits français de la bibliothèque du roi* (7 vols., 1836–1848); *Li Romans di Garin le Loherain, précédé d'un examen des romans carlovingiens* (1883–1885); *Li Romans de Berte aux grans piés* (1832), *Le Romancero français, histoire de quelques anciens trouvères et choix de leurs chansons* (1833); an edition of the *Grandes chroniques de France* (1836–1840); *La Chanson d'Antioche* (1848); *Les Aventures de maître Renart et d'Ysengrin* (1861) and *Les Romans de la table ronde* (1868–1877), both put into modern French.

His son Gaston Paris contributed a biographical notice to vol. xxix. of the *Histoire littéraire.*

PARIS, FRANÇOIS DE (1690–1727), French theologian, was born in Paris on the 3rd of June, 1690. He zealously opposed the bull *Unigenitus* (1713), which condemned P. Quesnel's annotated translation of the Bible. He gave further support to the Jansenists, and when he died (May 1, 1727) his grave in the cemetery of St. Médard became a place of fanatical pilgrimage and wonder-working. The king ordered the churchyard to be closed in 1732, but earth which had been taken from the grave proved equally efficacious and helped to encourage the disorder which marked the close of the Jansenist struggle (*see* JANSENISM).

Lives by B. de la Bruyère and B. Doyen (1731). *See* also P. F. Matthieu, *Histoire des miracles et des convulsionnaires de St. Médard;* M. Tollemache, *French Jansenists* (London, 1893).

PARIS, GASTON [BRUNO PAULIN GASTON] (1839–1903), French scholar, son of Alexis Paulin Paris, was born at Avenay (Marne) on Aug. 9, 1839. An early impulse to the study of Romance literature was developed by courses of study at Bonn (1856–57) under Friedrich Diez, at Göttingen (1857–58) and finally at the École des Chartres (1858–61). His first important work, *Étude sur le rôle de l'accent latin dans la langue française* (1862), was developed later in his *Lettre à M. Léon Gautier sur la versification latine rhythmique* (1866). Gaston Paris maintained that French versification was a natural development of popular Latin methods which depended on accent rather than quantity, and were as widely different from classical rules as the Low Latin was from the classical idiom. He succeeded his father as professor of mediaeval French literature at the Collège de France in 1872, becoming director in 1895; in 1876 he was admitted to the Academy of Inscriptions and in 1896 to the French Academy. Gaston Paris won a European reputation as a Romance scholar, and was a literary critic of great acumen and breadth of view. His *Vie de Saint-Alexis* (1872) provided a model for future editors of mediaeval texts. It included the original text and the variations dating from the 12th, 13th and 14th centuries. Gaston Paris contributed largely to the *Histoire littéraire de la France,* and with Paul Meyer published *Romania,* a journal devoted to Romance literature. He trained at the École des Chartres and the Collège de France a band of disciples who continued his traditions of exact research. Gaston Paris died in Paris on March 6, 1903. He had endeared himself to a wide circle of scholars outside his own country by his unfailing urbanity and generosity.

His works include: *Les plus anciens monuments de la langue française* (1875); *Deux rédactions du roman des sept sages de Rome* (1876); *La poésie du moyen âge* (1885 and 1895); *Penseurs et Poètes* (1897); *François Villon* (1901, "Grands écrivains français" series); *Légendes du moyen âge* (1903); an edition (with G. Raynaud) of the *Mystère de la passion d'Arnaud Greban* (1878); and a translation (with Brachet and A. Morel-Fatio) of Friedrich Diez's *Grammaire des langues romanes* (1874–78).

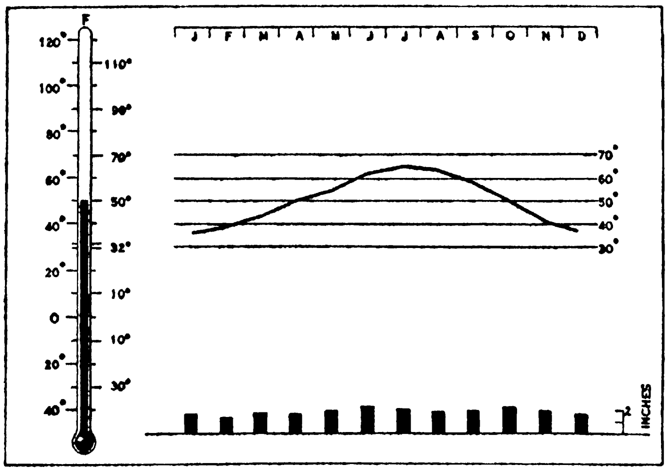
See "Hommage à Gaston Paris" (1903), the opening lecture of his successor, Joseph Bédier, in the chair of mediaeval literature at the Collège de France; A. Thomas, *Essais de philologie francaise* (1897); W. P. Ker, in the *Fortnightly Review* (July, 1904); M. Croiset, *Notice sur Gaston Paris* (1904); J. Bédier et M. Roques, *Bibliographie des travaux de Gaston Paris* (1904).

PARIS, LOUIS PHILIPPE ALBERT D'ORLÉANS, COMTE DE (1838–1894), son of the duc d'Orléans, the eldest son of King Louis Philippe, was born on Aug. 24, 1838. His mother was the princess Helen of Mecklenburg-Schwerin, a Protestant. By the death of his father in 1842, the count, then four years of age, became heir-apparent to the French throne. On the deposition of Louis Philippe in 1848, the duchess took her sons, the comte de Paris and the duc de Chartres, first to Eisenach in Saxony, and then to Claremont. In 1861 he and his brother were attached to the staff of General McClellan, commanding the "Army of the Potomac." The count fought in the siege of Yorktown (April 1862), at Williamsburg (May 5) and at Gaines Mill (June 27). When difficulties arose between France and the United States with regard to Mexico, the Orléans princes returned to Europe. On May 30, 1864, the count married his cousin, the princess Marie Isabelle, daughter of the duc de Montpensier; and his son and heir, the duc d'Orléans, was born in 1869. He returned to France after the fall of Napoleon III. and lived quietly on his estates. He had been refused permission to serve in the Franco-Prussian War.

In August 1873, at an important political conference at Frohsdorf, a fusion was effected, by which the comte de Paris agreed to waive his claims to the throne in favour of those of the comte de Chambord. By the death of the latter in 1883 the count became undisputed head of the house of Bourbon; but he did not push his claims. The popularity of the Orléans family, however, was shown on the occasion of the marriage of the comte de Paris's eldest daughter with the duke of Braganza, son of the king of Portugal, in May 1886. This led to a new law of expulsion, by which direct claimants to the French throne and their heirs were banished from France (June 11, 1886). The comte de Paris again retired to England, and devoted his leisure to study. In addition to his work *Les Associations ouvrières en Angleterre* (1869, and Eng. trs.), the count edited the letters of his father, and published at intervals *Histoire de la guerre civile en Amérique* (8 vols.). In his later years the count compromised the Royalist party by his relations with General Boulanger. He died on Sept. 8, 1894.

PARIS, capital of France and of the department of Seine, situated on the Île de la Cité, the Île St. Louis and the Île Louviers, in the Seine, as well as on both banks of the Seine, 233 m. from its mouth and 285 m. S.S.E. of London (by rail and steamer via Dover and Calais), in 48° 50′ 14″ N., 2° 20′ 14″ E. (observatory). It occupies the centre of the so-called Paris basin, which is traversed by the Seine from south-east to north-west, open towards the west, and surrounded by a line of Jurassic heights. The granitic substratum is covered by Jurassic, Cretaceous and Tertiary formations; and at several points building materials—freestone, limestone or gypsum—have been laid bare by erosion. It is partly, indeed, to the existence of such quarries in its neighbourhood, and to the vicinity of the grain-bearing regions of the Beauce and Brie, that the city owes its development. Still more important is its position at the crossing place of many continental lines of communication, that from Spain via western France, that from east Spain and the Mediterranean via the Rhône, those from

Switzerland via Geneva, Pontarlier or Basle and on via Belfort and Troyes or via Dijon and Sens, those from Germany via Lorraine, those from the Low Countries via Flanders, and lastly, those from the western sea. Paris is intermediately situated between the Mediterranean and the British regions, and also between the Mediterranean and Central Europe. The altitude of Paris varies between 80 ft. (at the Point du Jour, the exit of the Seine



WEATHER GRAPH OF PARIS. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE THE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE, AND THE COLUMNS, THE NORMAL MONTHLY PRECIPITATION

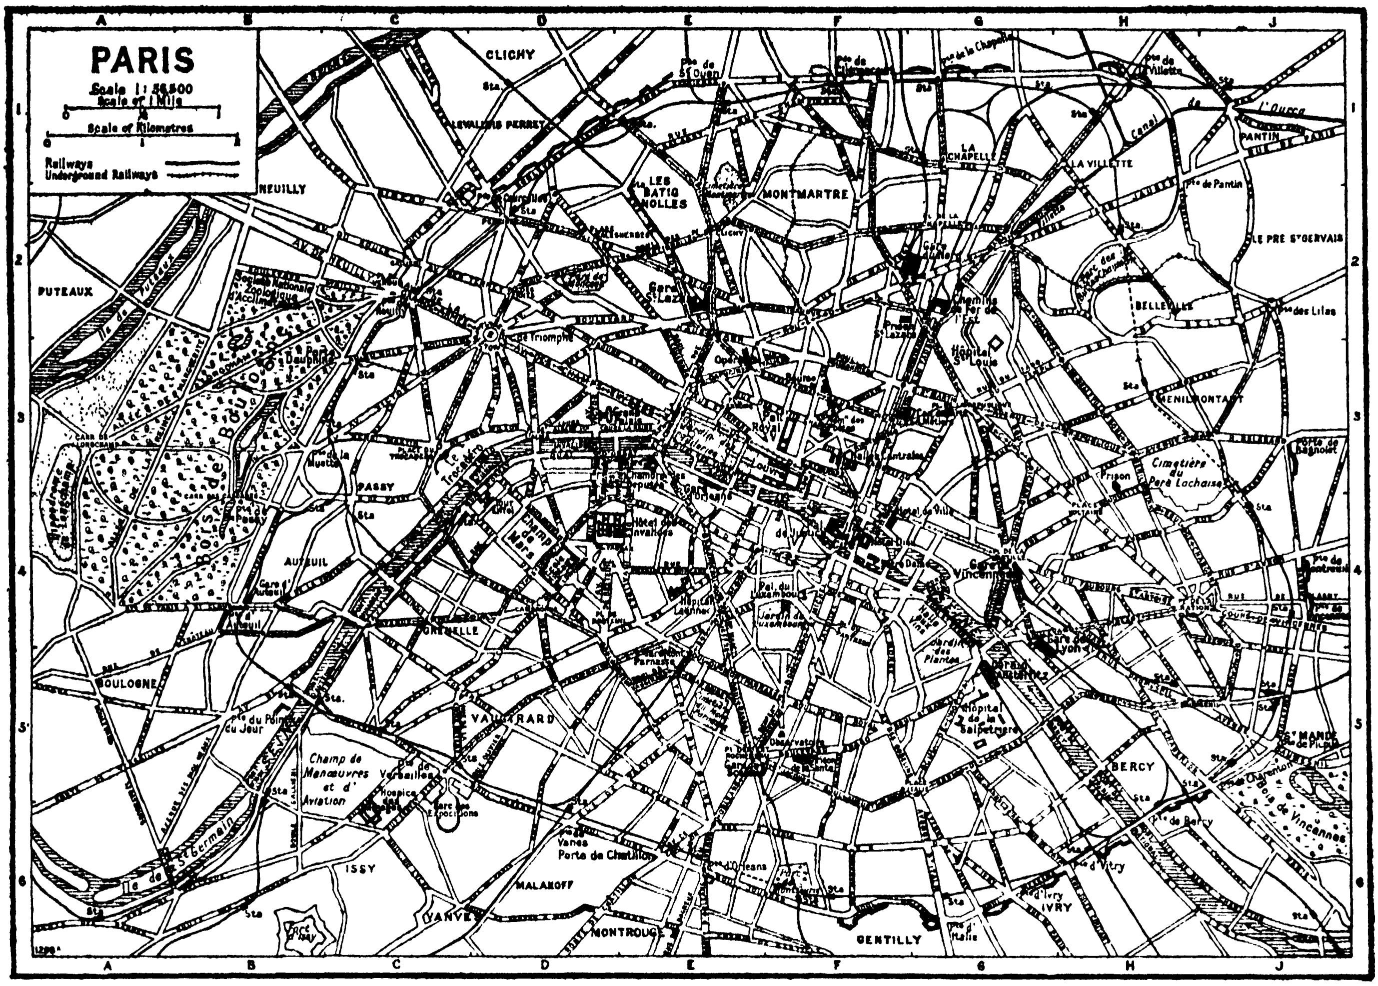
from the fortifications) and 420 ft. at the hill of Montmartre, in the north of the city; the other chief eminence is the hill of Ste. Geneviève, on the left bank The 1840 walls are, since 1860, the limit for the collection of municipal customs dues (*octroi*). The fortifications have been superseded since 1919 Within the wall the area of the city is 19,279 ac.; the river runs through it from east to west in a broad curve for a distance of nearly eight miles.

Climate.—The mean temperature is 50·5°, that for January being 36·5° and that for July 65·5°. The lowest temperature recorded is −14° and the highest 101° The Seine freezes when the temperature stays below 18° for a time. Frost is expected on about half the nights of the three winter months.

The rainfall is rather evenly distributed, with 20% in winter, 23% in spring, 28% in summer, and 29% in autumn The rainiest months are June and October and the driest is February. The average yearly fall is 20·8 inches The climate has been described as somewhat continental in winter and somewhat oceanic in summer. There are observatories on the Tour St Jacques, and at Montsouris, at Parc St. Maur, and at the three levels on the Tour Eiffel.

Topography.—The development of Paris can be traced outwards, in approximately concentric rings, from the Gallo-Roman town on the Île de la Cité to the fortifications which now form its boundary. A line of boulevards known as the Grands Boulevards, coinciding in great part with ramparts of the 14th, 16th and 17th centuries, encloses most of old Paris, a portion of which extends southwards beyond the Boulevard St Germain Outside the Grands Boulevards lie the *faubourgs* or old suburbs, round which runs another enceinte of boulevards—*boulevards extérieurs*—corresponding to ramparts of the 18th century Beyond them, other and more modern suburbs, incorporated with the city after 1860, stretch to the boulevards which line the fortifications of the period 1860–1919. In 1919 the fortified enceinte was abolished and its area was set apart for the building of flats at moderate rentals (Pelouse d'Avron on the east, and La Courneuve and Le Bourget on the north-east), and the provision of open spaces (park of the ancient Château des Sceaux, sites of former forts, etc.). A new "cité" for the university, with hostels, so far for British, Belgian and Argentine students, has been begun near Montsouris park, south of the city. The north, east and south are commercial or industrial in character, inhabited mainly by the working classes and *petite bourgeoisie,* on the west are wealthier residential centres (Auteuil and Passy). Of the *faubourgs* of Paris, those to the north and east are mainly commercial (Faubourgs St. Denis, St. Martin, Poissonnière) or industrial (Faubourgs du Temple and St. Antoine) in character, while to the west the Faubourg St. Honoré, the Champs Élysées and the Faubourg St. Germain have been occupied by mansions, but these areas, including the Champs Élysées as far west as the Arc de Triomphe, seem destined to be absorbed by business. The chief resorts of business and pleasure are concentrated within the Grands Boulevards, and more especially on the north bank of the Seine. No uniformity marks the street-plan of this or the other quarters of the city. One broad and almost straight thoroughfare bisects it, under various names, from Neuilly (west-north-west) to Vincennes (east-south-east). Within the limits of the Grands Boulevards it is known as the rue de Rivoli (over 2 m. in length) and the rue St. Antoine, and runs parallel with and close to the Seine from the place de la Concorde to the place de la Bastille. From the Eastern station to the observatory, Paris is traversed north-north-east and south-south-west for 2½ m. by another important thoroughfare—the boulevard de Strasbourg, continued as the boulevard de Sébastopol, as the boulevard du Palais on the Île de la Cité, and on the south bank as the boulevard St Michel. A further line of boulevards has been developed between the place de la Concorde and the place Denfert Rochereau on the southern prolongation of the boulevard St Michel, while the boulevard Jules Ferry has been made to give access from the boulevard Richard Lenoir to the quays beside the canal St. Martin, thus providing another way around the east of the city. The line of the Grands Boulevards from the Madeleine to the Bastille, by way of the place de l'Opéra, the porte St. Denis and the porte St Martin (two triumphal arches erected in the latter half of the 17th century in honour of Louis XIV.) and the place de la République, stretches for nearly 3 miles It contains most of the large cafés and several of the chief theatres, and though its gaiety and animation are concentrated at the western end—in the boulevards des Italiens, des Capucines and de la Madeleine—it is, as a whole, one of the most celebrated avenues in the world. On the right side of the river may also be mentioned the rue Royale, from the Madeleine to the place de la Concorde; the Malesherbes and Haussmann boulevards, the first stretching from the place Madeleine north-west to the former fortifications, the second from the Grands Boulevards near the place de l'Opéra now right to the place de l'Étoile; the avenue de l'Opéra, which unites the place du Palais Royal, approximately the central point of Paris, with the place de l'Opéra; the rue de la Paix, connecting the place Vendôme with the place de l'Opéra, and noted for its fashionable dress-making establishments, and the rue Auber and rue du Quatre Septembre, also terminating in the place de l'Opéra, in the vicinity of which are found some of the finest shops in Paris; the rue St. Honoré running parallel with the rue de Rivoli, from the rue Royale to the Central markets; the rue de Lafayette, one of the longest streets of Paris, traversing the town from the Opéra to the Bassin de la Villette; the boulevard Magenta, from Montmartre to the place de la République; and the rue de Turbigo, from this *place* to the Halles Centrales On the left side of the river the main thoroughfare is the boulevard St Germain, beginning at the Pont Sully, skirting the Quartier Latin, the educational quarter on the north, and terminating at the Pont de la Concorde after traversing a quarter mainly devoted to ministries, embassies and other official buildings.

Squares.—Some of the chief squares have already been mentioned The finest is the place de la Concorde, laid out under Louis XV. by J. A. Gabriel, the scene of the execution of Louis XVI., Marie Antoinette and many victims of the Revolution. The central decoration consists of an obelisk from the great temple at Luxor in Upper Egypt, presented to Louis Philippe in 1831 by Mohammed Ali. The place Vendôme, begun towards the end of the 17th century, has a column surmounted by a statue of Napoleon I, and decorated with plates of bronze, on which are depicted scenes from the campaign of 1805. The place de l'Étoile is the centre of 12 avenues radiating from it in all directions. The chief of these is the avenue des Champs Élysées, which connects it with the place de la Concorde; while on the other side the avenue de la Grande Armée leads to the former fortifications, the



two forming a section of the main artery of Paris; the well-wooded avenue du Bois de Boulogne leads to that celebrated park. In the centre of the place, the Arc de Triomphe de l'Étoile, the largest triumphal arch in the world (162 ft. high by 147 ft. wide), commemorates the military triumphs of the Revolutionary and Napoleonic troops. Under it has recently been placed the "Grave of the Unknown Soldier." In the place de la République stands a huge statue of the Republic. The place de la Bastille stands a little to the east of the site of the famous State prison. It contains the Colonne de Juillet, erected in memory of those who fell in the revolution of July 1830. The place du Carrousel, within the western wings of the Louvre, and so named from a revel given there by Louis XIV., was enlarged about the middle of the 19th century. The triumphal arch on its west side commemorates the victories of 1805 and formed the main entrance to the Tuileries palace (*see* below). Facing the arch there is a stone pyramid forming the background to a statue of Gambetta. Other squares are the place des Victoires, dating from 1685; the place des Vosges, formerly place Royale, formed by Henry IV. on the site of the old Tournelles palace; the place de l'Hôtel de Ville, once the place de Grève; the place du Châtelet, on the site of the prison of the Grand Châtelet, pulled down in 1802, with a fountain and a column commemorative of victories of Napoleon, and the place de la Nation, corresponding at the east of the city to the place de l'Étoile at the west.

South of the Seine are the place St. Michel, one of the great centres of traffic in Paris; the Carrefour de l'Observatoire, with the monument to Francis Jarnier, the explorer, and the statue of General Ney standing on the spot where he was shot; the place du Panthéon; the place Denfert Rochereau, adorned with a colossal lion symbolizing the defence of Belfort in 1871; the place St. Sulpice, with a modern fountain embellished with the statues of the preachers Bossuet, Fénelon, Massillon and Fléchier; the place Vauban, behind the Invalides; and the place du Palais Bourbon, in front of the Chamber of Deputies. On the Île de la Cité, in front of the cathedral, is the place du Parvis-Notre-Dame.

The Seine.—The Seine flows for nearly 8 m. through Paris. As it enters and as it leaves the city it is crossed by a viaduct used by the circular railway and for ordinary traffic; that of Point du Jour has two storeys of arches. Three bridges—the Passerelle de l'Estacade, between the Île St. Louis and the right bank, the Pont des Arts and the Passerelle Debilly (close to the Trocadéro)—are for foot passengers only; all the others are for carriages as well. The most famous, and in its actual state the oldest, is the Pont Neuf, begun in 1578, the two portions of which rest on the extremity of the island called La Cité, the point at which the river is at its widest (863 ft.). On the embankment below the Pont Neuf stands the equestrian statue of Henry IV. Between La Cité and the left bank the width of the lesser channel is reduced to 95 feet. The river has a width of 540 ft. as it enters Paris and of 446 ft. as it leaves it. After its entrance to the city it passes under the bridges of Tolbiac, Bercy and Austerlitz, that of Sully, those of Marie and Louis Philippe between the Île St. Louis and the right bank; that of La Tournelle between the Île St. Louis and the left bank; that of St. Louis between the Île St. Louis and La Cité. The Cité communicates with the right bank by the Pont d'Arcole, the Pont Notre-Dame, built on foundations of the 15th century, and the Pont au Change, owing its name to the shops of the money-changers and goldsmiths which bordered its mediaeval predecessor; with the left bank by that of the Archevêché, the so-called Pont au Double, the Petit Pont and the Pont St. Michel, the original of which was built towards the end of the 14th century. Below the Pont Neuf come the Pont des Arts, Pont du Carrousel, Pont Royal (a fine stone structure leading to the Tuileries), and those of Solférino, La Concorde, Alexandre III., Invalides, Alma, Iéna (opposite the Champ de Mars), Passy, Grenelle and Mirabeau. The Seine has at times caused disastrous floods in the city. A canal to unite the Marne (from

the Transition style, dates from the 11th to the 13th centuries. The Musée Carnavalet was built in the 16th century for François de Kernevenoy, whence its present name, and enlarged in 1660; Mme. de Sévigné afterwards resided there. The national archives are stored in the hôtel Soubise (early 18th and 19th century), on the site of a house built by Olivier de Clisson in 1370. It was afterwards added to by the family of Guise, and rebuilt by François de Rohan, duke of Soubise. The palace of Cardinal Mazarin, augmented in modern times, contains the Bibliothèque Nationale. The palais de l'Institut, formerly the Collège Mazarin, dates from the last half of the 17th century; it is the seat of the academies (except the Academy of Medicine, which occupies a modern building close to the École des Beaux-Arts) and of the Bureau des Longitudes, the great national astronomical council. The Military school (18th century) overlooks the Champ de Mars. The huge Sorbonne buildings date from the latter years of the 19th century, with the exception of the church, which belonged to the college as reconstructed by Richelieu. The astronomical observatory is a splendidly-equipped building erected under Louis XIV. The École des Beaux-Arts (facing the Louvre, on the left bank of the Seine), with its interesting collections, partly occupies the site of an Augustinian convent, and comprises the old hôtel Chimay. It was erected from 1820 to 1838 and added to later. The courtyard contains part of the façade of the Norman château of Gaillon (16th century), destroyed in the Revolution, and the portal of the château of Anet (erected by Philibert Delorme in 1548) has been adapted as one of the entrances. The Grand Palais des Beaux-Arts, where horse-shows, etc., as well as annual exhibitions of paintings and sculptures are held, and the Petit Palais des Beaux-Arts, which contains art collections belonging to the city, date from 1897–1900. The Bourse belongs to the first half and the Tribunal of Commerce and the Trocadero are of the second half of the 19th century.

The so-called Maison de François I. (on the Cours la Reine, overlooking the Seine), is a small but beautifully decorated building, erected at Moret in 1527 and re-erected in Paris in 1826. In the St. Gervais quarter are the hôtel de Beauvais, of the latter half of the 17th century, and the hôtel Lamoignon, built after 1580 for Diane de France, duchess of Angoulême, both of which have handsome courtyards; in the same quarter is the hôtel de Sens, of the 15th century, residence of the archbishops of Sens, whose province then included the diocese of Paris. The hôtel Lambert, on the Île St. Louis, built by L. Levau, in the 17th century, for Nicholas Lambert, and afterwards inhabited by Mme. du Châtelet and Voltaire and George Sand, has a magnificent staircase and many works of art. The hôtel de Sully, built for the duke of Sully, from 1624 to 1630, is in the rue St. Antoine and has an interesting courtyard. Of the fine mansion of the dukes of Burgundy the only relic is a tower of the early 15th century, built by Jean Sans Peur.

Theatres, etc.—The Opéra (entitled the National Academy of Music) was originally founded in 1671. After several changes of locale, it was eventually transferred from the rue Le Peletier to the present fine opera-house (1861–75).

The Théâtre Français or Comédie Française was formed in 1681, under the latter name, by the union of Molière's company with two other theatrical companies of the time. The name Théâtre Français dates from 1791, when part of the company headed by the tragedian, Talma, migrated to the south-west wing of the Palais Royal, which the company, reunified in 1799, has since occupied. Both the Théâtre Français and the less important Odéon, a building of 1782 twice rebuilt, close to the Luxembourg garden, present the works of the classical dramatists and modern dramas, both tragic and comic. The Opéra-Comique, founded in the early 18th century, occupies a building in the boulevard des Italiens, reconstructed after a fire in 1887. Serious, as well as light opera, is performed there. There are many other well known theatres. A journal, *Comoedia,* publishes (1929) details of the cast at the various theatres, and thus offers a useful theatre guide. There are many music halls with variety turns, and also numerous *cafés concerts,* usually without admission charge, at which one is supposed to order refreshments. *Cabarets artistiques* specialize in social and political satire.

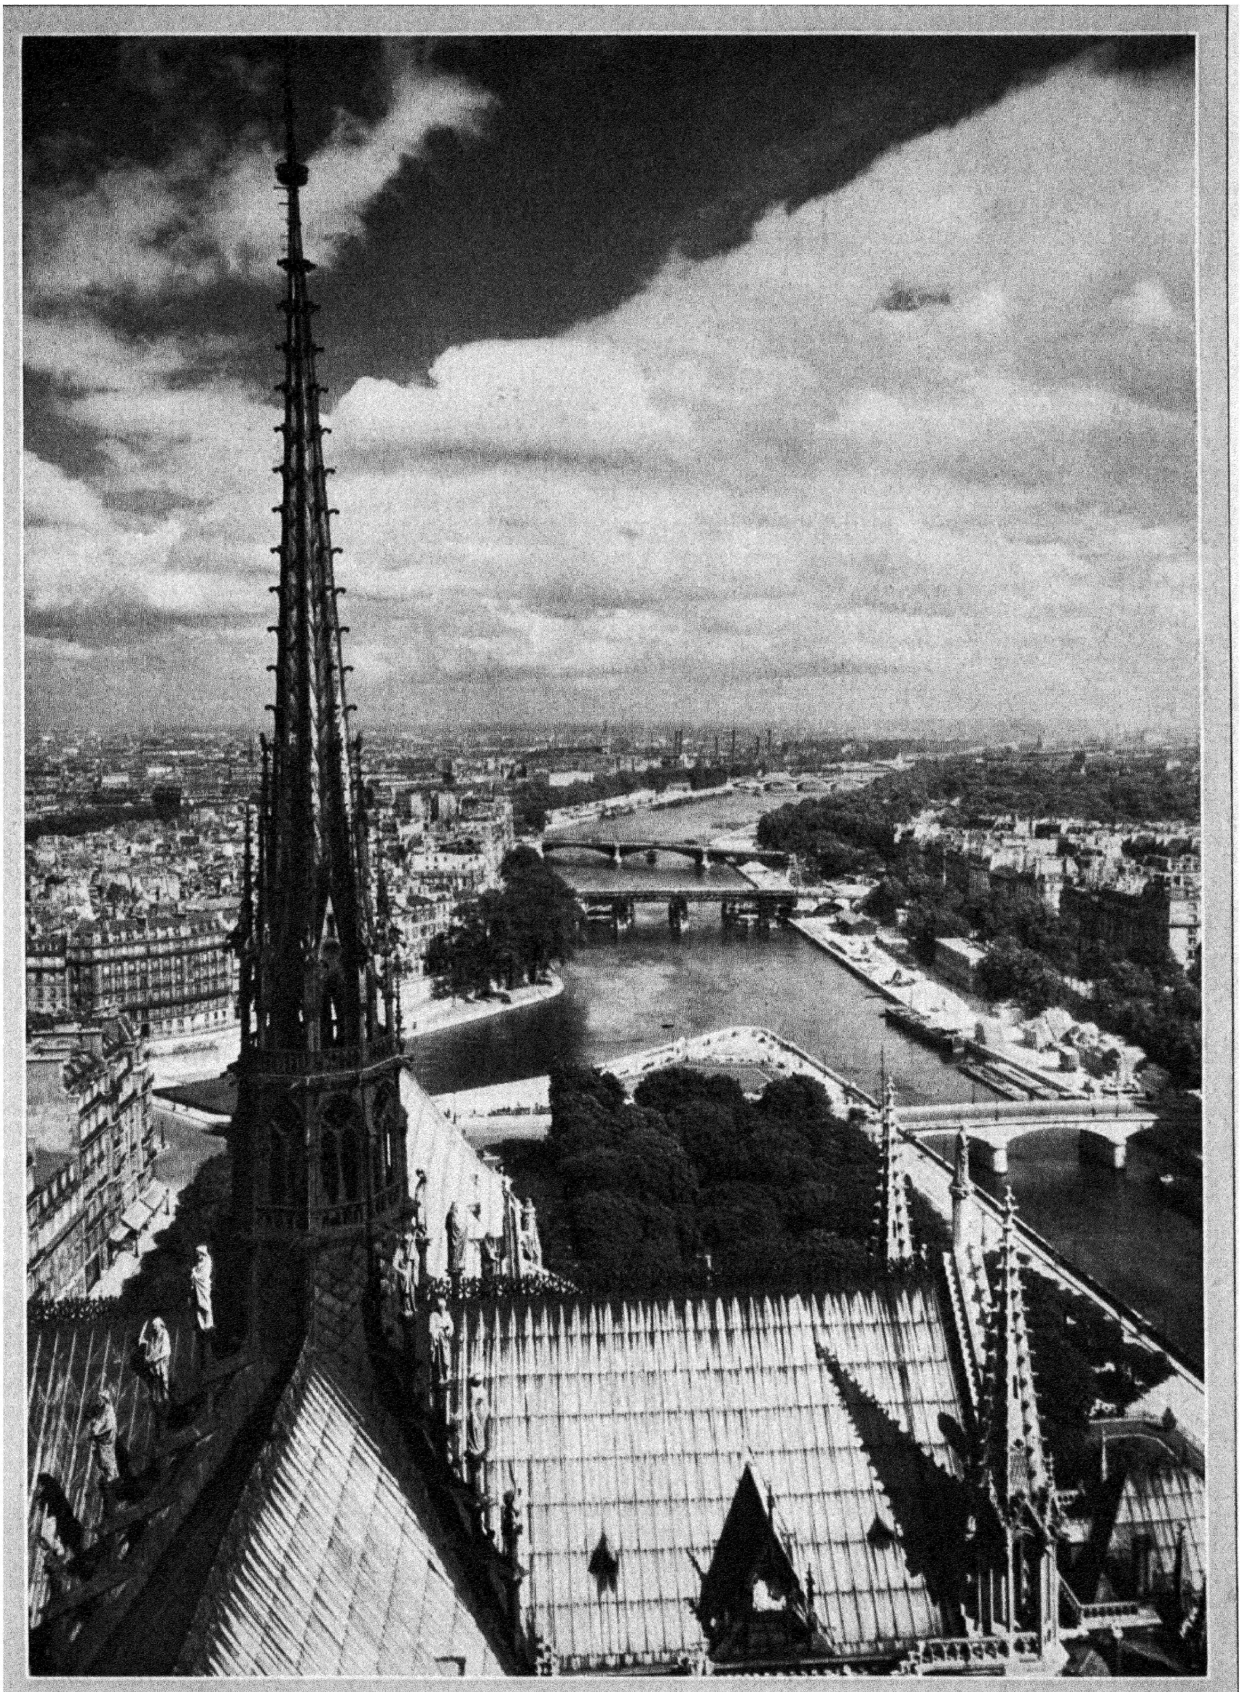
Music and Painting.—Music has its headquarters at the Conservatoire de Musique with concerts (1929) especially on Sunday afternoons; the concerts Colonne, Lamoureux, Pasdeloup, Touche, are widely known, while the Schola Cantorum and the concerts spirituels de la Sorbonne are of special interest, and music is also often given at the Trocadero. The Salles Gaveau, Pleyel, Erard, etc., also provide music; of the churches, La Madeleine, St. Eustache, St. Roch, St. Sulpice, and Notre Dame are most famed for music. Paris is famed for its exhibitions of pictures, the "Salon" at the Grand-Palais des Champs Elysées being best known; it is held in May and June. Several societies organize other exhibitions, and some firms also hold exhibitions of value.

Sport.—Paris is the chief centre of French sports, and many forms of sport are directed from the Fédération française d'athlétisme, the Stade français and the Racing Club de France. The chief horse-races are at Longchamps and Auteuil, with other important ones at Chantilly and elsewhere; the large Stade Pershing was given to France by the American army and the Y.M.C.A. It is situated at Vincennes. There are several aviation clubs. Special mention may be made of the important tennis clubs.

Museums.—The Louvre now houses one of the most celebrated museums in the world. On its ground floor are collections: (1) of antique sculpture, including the Venus de Milo, the Pallas of Velletri, the Hera of Samos, the "Tiber" group, and many other famous treasures. The well known Nike of Samothrace is apart from these, at the head of a staircase; (2) of mediaeval and Renaissance sculpture, including work by Michelangelo, Jean Goujon, Germain Pilon, the Della Robbia, Donatello, Benvenuto Cellini (bronze), etc.; (3) of Egyptian antiquities; (4) of south-west Asiatic and Carthaginian antiquities, including such famous objects as the stele of Hammurabi and the Moabite stone; and (5) of French sculpture of the 17th–20th centuries.

The first floor has been much rearranged in recent years, the splendid collection of paintings of non-French artists being now arranged in "schools" in the Grande Galérie. This collection contains many masterpieces by Leonardo da Vinci (the "Virgin of the Rocks," "Mona Lisa," etc.), Raphael ("Baldassare Castiglione," the "Man with the Glove," etc.), Correggio (the "Marriage of St. Catherine"), and almost all the chief painters of the Renaissance. Velasquez, El Greco, Murillo and Goya are represented. The Van Dyck collection is most remarkable, including the famed picture of Charles I. of England, the "Flight of Lot," and others. The work of Rembrandt is choicely and richly represented, and the salle Rubens preserves 18 of that master's 21 large allegorical paintings of the life of Marie de' Medici. Another section includes a "Virgin and Child" by Jan van Eyck, "Salvator Mundi" by Roger van der Weyden, and work by Memling and others. The salon Carré has some large Italian pictures (Raphael, Titian, Tintoretto, Correggio, Paolo Veronese). There is a *salle des primitifs italiens,* with such treasures as Fra Angelico's "Coronation of the Virgin." The collection of French pictures includes a historical section and the Chauchard collection of Corot, Meissonier, Millet ("The Angelus," etc.) and other artists. French art occupies the second floor (work of Manet, Monet, Dégas, Cézanne and others), and the pavillon de Marsan houses a museum of decorative art. The first floor also includes the collections of pottery, furniture, tapestry, metal work, enamels, jewellery, ivories, bronzes, etc., a collection of British pictures, a collection of drawings (Watteau is notably represented). On this floor are also collections of Egyptian, Asiatic and classical antiquities supplementing those on the ground floor, and still others are housed in the pavillon de la Trémoille. In addition to the pictures above mentioned, the second floor houses a Muslim museum and a naval museum. The entresol contains a collection of engravings and the Far Eastern collections.

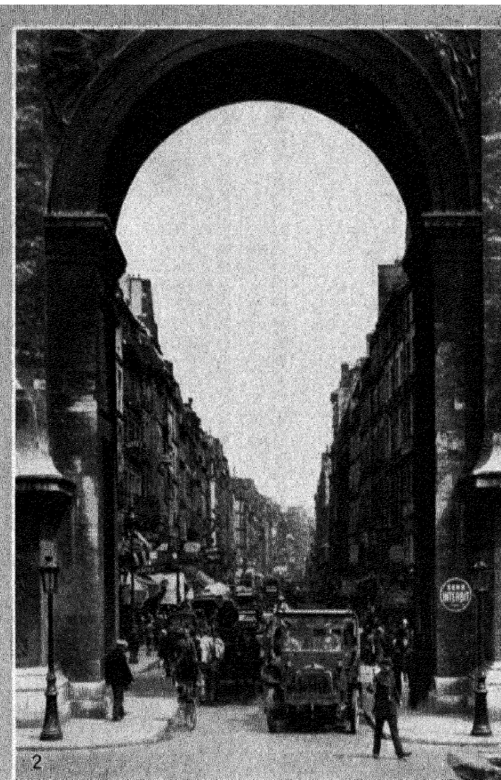
The museum of the Luxembourg, installed in a building near the palace occupied by the senate, is devoted to works of living painters and sculptors acquired by the State. They remain there for ten years after the death of the artist, that the finest may be selected for the Louvre. Some pictures by Dégas and Cézanne

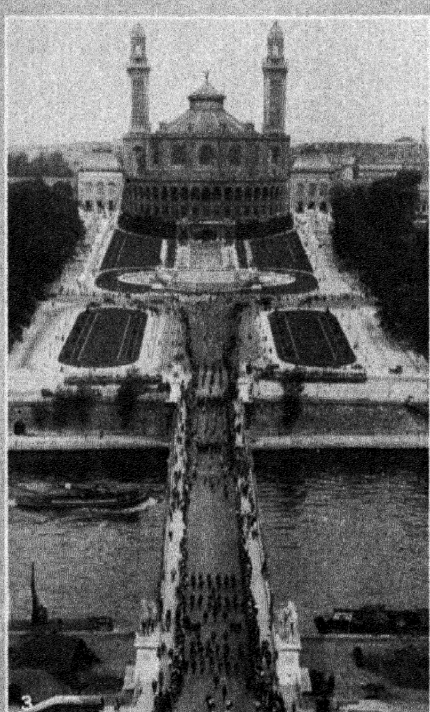


LOOKING EAST ALONG THE SEINE, FROM THE ROOF OF NOTRE DAME

The cathedral of Notre Dame (built 1163–1240) is situated at the east end of the Ile de la Cité, the oldest part of Paris, and the centre of the mediaeval city. The bridge at the lower right, the Pont de l'Archevêché, connects the island with the "Left Bank" where the university and student quarters are situated. At the left centre of the illustration is seen a part of the Ile Saint-Louis

PARIS





SITES OF HISTORICAL INTEREST IN OLD PARIS

1. Aerial view of the Ile de la Cité, the oldest section of Paris. In the foreground is the Palais de Justice a vast pile of buildings within the enclosures of which are the Sainte-Chapelle, erected in 1246–48 under St. Louis, and the Conciergerie, famous prison of the Revolution. At the upper end of the island, at the right, is the cathedral of Notre Dame (1163–1240). Beyond, is seen the Ile St.-Louis, connected with the Cité by the Pont St.-Louis
2. Porte St. Denis, looking toward the Rue du Faubourg-St.-Denis. This gate was built in 1672–73 by F. Blondel in honour of the victories of Louis XIV., and stands on the site of the old city gate
3. View of the park and palace of the Trocadéro, from the Eiffel tower on the left bank of the Seine. The palace, built for the Exhibition of 1878, contains a large hall, an ethnographical museum, a museum of Casts and a museum of Cambodian antiquities. The Pont d' Iena, in the foreground was built in 1806–13 to commemorate the victory of Napoleon over the Prussians at Jena in 1806
4. Place de la Bastille, near the site of the famous state prison demolished at the beginning of the French Revolution. The bronze Colonne de Juillet, 154 feet in height, which was erected in memory of those who fell in the July Revolution of 1830, occupies the centre of the square

Arrondissements	Quarters	Population 1906	Population 1926	Inhabitants per acre

were still at the Luxembourg in 1927, and here is also the famous "Bronze age" of Rodin. Foreign pictures belonging to the Luxembourg are now housed in the Musée du Jeu de Paume, in the Tuileries gardens. They include well known works of G. F. Watts, Constantin Meunier, J. S. Sargent and others.

The Cluny museum occupies the old mansion of the abbots of that order (*see* above). It contains about 11,000 examples of mediaeval and Renaissance art-sculptures in marble, wood and stone, ivories, enamels and mosaics, pottery and porcelain, tapestries, bronzes, specimens of goldsmith's work, both religious and civil, including nine gold crowns of the 7th century found near Toledo, Venetian glass, furniture, iron-work, State carriages, ancient boots and shoes, and pictures.

The Carnavalet museum comprises a collection illustrating the history of Paris, and includes pictures, portraits, furniture, etc. The Petit Palais des Beaux-Arts contains art collections belonging to the city (especially the Dutuit collection). The house of Gustave Moreau, rue Rochefoucauld, is now a museum of his paintings, and that of Victor Hugo, place des Vosges, contains a collection of objects relating to the poet. The Musée Jacquemart-André, opened in 1913, has choice paintings, sculpture, tapestry, etc. The Musée Rodin is of special value for the great sculptor's work.

The Trocadero palace contains a museum of casts illustrating the progress of sculpture, chiefly that of France, from the 11th to the 18th century; it also possesses a collection of Khmer antiquities from Cambodia and an ethnographical museum. In the same neighbourhood are the Guimet museum, containing the collections of oriental pottery, of objects relating to the oriental religions, and of antiquities presented to the State in 1885 by Émile Guimet of Lyons; and the Galliéra museum, erected by the duchess of Galliéra and containing a collection of tapestries and other works of art belonging to the city. The Cernuschi oriental museum is close to the Monceau park.

The collection of mss., engravings, medals and antiques in the rich Bibliothèque Nationale are important, as also are the industrial and machinery exhibits of the Conservatoire des Arts et Métiers. The Musée de l'Armée at the Invalides has much historical interest.

The Musée des Antiquités Nationales, one of the most important of all archaeological collections, is housed near Paris in the château de St. Germain-en-Laye. The musée des Monnaies is attached to the Mint, and exhibits coins, medals and plaquettes. The Jardin des Plantes has attached to it zoological, botanical, geological, mineralogical, palaeontological, anatomical and anthropological galleries, and there is also a separate collection illustrating plant physiology.

For libraries *see* LIBRARIES.

Population.—The growth of the population since 1801 is shown in the following table, which gives the population present on the census day, including the *population comptée à part, i.e.,* troops, inmates of hospitals, prisons, schools, etc.

Years	Population	Years	Population
1801	547,756	1881	2,239,928
1831	785,862	1891	2,424,705
1851	1,053,262	1901	2,660,559
1861	1,696,141	1906	2,722,731
1872	1,851,792	1926	2,871,429

Paris is divided into 20 arrondissements, of which the first 12 belonged to it before 1861 and the others were suburbs then annexed:—

In the first four, which constitute old Paris north of the Seine, with the islands, the population has long been decreasing, as this is the great business area. In arrondissements V.–VII., on the left or south bank, opposite nos. I.–IV., the population is relatively stable, with a slight tendency to increase in the west. In arrondissements VIII.–XI., which fringe old Paris on the north bank, the tendency to decrease is very clear. In the arrondissements of the outer zone (XII.–XX.) there is a general increase of population, most marked in the south-west (XV. and XVI.); Nos. XIII.–XV. belong to the left bank. The east side of old Paris (III. and IV.), and arrondissement XI., fringing it, to the east, are the most densely-populated areas, and some parts of them are very closely packed indeed. Montmartre and Batignolles stand out in the matter of density of population in the outer zone.

Administration.—Paris occupies a large part of the department of Seine, and the typical French departmental and municipal systems of administration are to some extent modified to meet the special circumstances. Paris has 20 divisions, called arrondissements, each containing four quarters, while the rest of the department includes two arrondissements with 22 cantons. The head of the administration of a department is a prefect, appointed by the minister of the Interior, and there is usually a sub-prefect for each arrondissement. In the case of the department of Seine and the City of Paris, the prefect is head of the administration of both, but there are no sub-prefects for the arrondissements within the city. There is a prefect of police, also appointed by the minister of the Interior, and his jurisdiction extends even beyond the department to a few communes that are practically parts of Paris.

There is a municipal council of 80 members, one from each of the four quarters of each of the 20 arrondissements of the city. The council elects its own chairman, votes the budget and discusses the prefect's administration. The prefect of the department and the prefect of police may attend its meetings and, under certain circumstances, may overrule its decisions if this be necessary in order to maintain the public services. In cases of illegality, the decisions of the municipal council may be overruled by the President of the Republic. The municipal council, together with one representative from each of the 22 cantons outside Paris, forms the council of the department of Seine.

The prefect of the department has charge of finance, elections, public works, public lands, primary education, charities, roads, lighting, markets, pawnbroking (the *mont de piété*), and judicial actions. He is helped by staffs of technical experts and by committees on housing, statistics, etc. A housing policy has been pursued since 1918, and a labour exchange was established for Paris and the department of Seine in 1915.

The prefect of police has a judicial staff for pursuit of crime, and a general staff for social duties. He maintains the peace, inspects weights and measures, licenses public spectacles, licenses public vehicles, overlooks markets, is in charge of prisons, and has much to do with health. In the last matter he is helped by a council of public health of the department. This discusses water supply and sewage problems, disinfection, etc., and it has attached to it a board of health in each arrondissement of Paris.

Each of the 20 arrondissements has a mayor, who is allowed three deputies; all of these are appointed by the President of the Republic. This mayor has charge of the affairs of the arrondissement, is a registrar of births, marriages and deaths, and has to call up the conscripts. Each arrondissement has its juge de paix and its police force under an officier de paix. In nearly every quarter there is a commissaire de police, who sanctions the committing of arrested persons to prison, and who acts as a magistrate in small disputes.

Law and Justice (*see* FRANCE: *Justice*, for an account of the judicial system of the country as a whole).—Paris is the seat of four courts having jurisdiction over all France: (1) The Tribunal des Conflits, for settling disputes between the judicial and administrative authorities on questions as to their respective jurisdiction; (2) the Council of State, which includes a section for cases of litigation between private persons and public departments; (3) the Cour des Comptes, and (4) the Cour de Cassation. The first three sit in the Palais Royal, the fourth in the Palais de Justice, which is also the seat of: (1) a *cour d'appel* for seven departments (seven civil chambers, one chamber of appeal for the correctional police, one chamber for preliminary proceedings); (2) a *cour d'assises;* (3) a tribunal of first instance for the department of Seine, comprising seven chambers for civil affairs, four chambers of correctional police; (4) a police court where each *juge de paix* presides in his turn, assisted by a *commissaire de police*. Litigations between the departmental or municipal administrations and private persons are decided by the *conseil de préfecture*. Besides these courts there are *conseils de prud'hommes* and a tribunal of commerce. The *conseils de prud'hommes* settle differences between workmen and workmen, or between workmen and masters; the whole initiative, however, rests with the parties. There are four of these bodies in Paris (for the metal trades, the chemical trades, the textile trades and building industries), composed of an equal number of masters and men. The tribunal of commerce, sitting in a building opposite the Palais de Justice, is composed of business men elected by the "notables" of their order, and deals with cases arising out of commercial transactions; declarations of bankruptcy are made before it; it also acts as registrar of trade-marks and of articles of association of companies, and as court of appeal to the *conseils de prud'hommes.*

Prisons.—There are three places of detention in Paris—the Dépôt of the prefecture of police (in the Palais de Justice), where persons arrested and not released by the commissaries of police are temporarily confined, the Conciergerie or *maison de justice*, for the reception of prisoners accused of crimes, who are there submitted to a preliminary examination before the president of the court of assizes, and the Santé (near the Place Denfert-Rochereau), for prisoners awaiting trial and for remanded prisoners. The old prisons of Mazas, Ste. Pélagie and La Grande-Roquette, the demolition of which was ordered in 1894, have been replaced by the prison of Fresneslès-Rungis for condemned prisoners. The prisoners, kept in solitary confinement, are divided into three groups: those undergoing short sentences, those sentenced to hard labour while awaiting transference to their final place of detention or to sentences over a year, and sick prisoners, occupying the central infirmary of the prison. The Petit Roquette (occupied by children) was replaced by the agricultural and horticultural colony of Montesson inaugurated in 1896.

Communications.—The great railways of France, with the exception of the Midi railway, have terminal stations in Paris. The principal stations of the Nord, Est and Ouest-État systems (that of the last is the Gare St. Lazare), lie near the outer boulevards in the north-centre of the city; the terminus of the Paris-Lyon-Méditerranée railway is in the south-east, close to the right bank of the Seine; opposite to it, on the left bank, is the Gare du Quai d'Austerlitz, and on the Quai d'Orsay the Gare du Quai d'Orsay, both belonging to the Orléans railway. The Gare Montparnasse, to the south-west of the Luxembourg, is used by the Ouest-État and the État railways. Other less important stations are the Gare de Vincennes (line of the eastern railway to Vincennes), the Gares du Luxembourg and de Paris-Denfert (line of the Orléans railway to Sceaux and Limours), and the Gare des Invalides (line of Ouest-État railway to Versailles).

Railway communication round Paris is afforded by the Chemin de Fer de Petite Ceinture, running around just within the line of the old fortifications. There is a Grande Ceinture line farther out, used chiefly for goods. The underground electric railways, with stations about ½ km. apart, include the Nord-Sud (from the three northern gates to the Porte de Versailles) and the Métropolitain. This latter system now includes lines west-east (Maillot-Vincennes) and north-east-south-west (porte de la Villette–vicinity of Montparnasse), loop lines more or less following the inner and the outer boulevards, the latter making a wide arc through south Paris as well, and other loops and branches. The above systems cross beneath the river in seven places. There is an extensive tramway system, and the omnibus system has developed on a large scale in recent years. The river steamers (*bateaux-omnibus*) run at frequent intervals right through Paris.

Water Supply.—The earliest water supply was that due to the Romans, who brought it from Rungis by aqueduct; in the middle ages numerous springs were used until Henri IV. built a hydraulic machine (La Samaritaine) on the Pont Neuf, to pump water from the river. The city acquired, in the 19th century, the sources of a number of streams of the district, Ourcq, Beuvronne, Vanne, Dhuys, Voulzie, Durtain and Avre, and built long aqueducts. There are modern pumping and filtering stations at Ivry, St. Maur and elsewhere, to get drinking water from the river when other sources of supply run low. These pumping stations also supply water for public and industrial purposes, and the Ourcq canal is also drawn upon for this purpose, as are artesian wells. There are reservoirs in the higher parts of the city and the supply is distributed by two systems of pipes, at high and low pressure respectively. Wherever possible, a main pipe receives its supply from two different directions, thus minimizing effects of accidental interruptions. The development of sewers began under Louis XIII., but the main growth of the system is modern. There is a main sewer on each side of the river, and that of the left side is conducted under the river to join that of the right. The sewage of some low-lying areas has to be pumped up into the system.

The debouchment of part of the system is beyond the porte de Clichy, on the riverine peninsula of Gennevilliers, which is thus fertilized. From this the water returns to the Seine. The collecting sewer of the north-eastern area is led out to St. Denis. The sewers serve as conduits for water pipes, gas pipes, telegraph and telephone wires, pneumatic tubes, etc.

Education (*see* also FRANCE).—The public system includes *écoles maternelles* or kindergartens, and infant schools, managed by women, primary schools, with some amount of charitable assistance and of school feeding, school camp and boarding schemes, higher primary schools, technical schools, domestic science schools for girls, the college Chaptal and the college Rollin, which send boys on to the School of Mines, the Polytechnic school, etc., a number of lycées or secondary schools, of which some are old and famous foundations, and a good many private institutions and *écoles confessionnelles* (denominational schools).

The five faculties of medicine, law, science, literature and Protestant theology, and the higher school of pharmacy, form the body of faculties, the association of which is known as the

University of Paris. The faculties of science and literature, together with their library, are established at the Sorbonne, which is also the seat of the *académie*, of which Paris is the centre, and of the *École des chartes*. The faculty of medicine, with its laboratories (*École pratique*), occupies separate buildings near the Sorbonne. The law school is also close to the Sorbonne. Of the 12,600 students at the university in 1905–06 some 1,260 were foreigners, Russians and Rumanians being most numerous among the latter. The faculty of law is the most largely attended, some 5,000 students being enrolled therein At the *Collège de France*, founded by Francis I., and situated opposite the Sorbonne, the various branches of learning are represented by very numerous chairs, to which are elected scholars of special distinction. They give courses of lectures open to the general public. The *Muséum d'histoire naturelle* gives instruction in the natural sciences; the *Écoles des hautes études* have for their main object the encouragement of scientific research. The *École pratique des hautes études*, attached to the Sorbonne, is the chief institution of the kind. In addition, there are several great national schools attached to various ministries. Dependent on the Ministry of Education are the *École normale supérieure*, for the training of teachers in lycées; the *École des chartes* (palaeography and the use of archives); the *École spéciale des langues orientales*, for the training of interpreters; the *École nationale et spéciale des beaux-arts* (painting, sculpture, architecture, etc), in the various departments of which are conferred the *prix de Rome*, entitling their winners to a four years' period of study in Italy, the *Conservatoire national de musique et de déclamation* (music and acting), which also confers a *grand prix* and possesses a fine library and collection of musical instruments; the *École nationale des arts décoratifs* (art applied to the artistic industries); the *École du Louvre*, for the instruction of directors of museums. Depending on the Ministry of War are the *École polytechnique*, which trains military, governmental and civil engineers; the *École supérieure de guerre* (successor of the officers' training school, founded in 1751) for advanced military studies Attached to the Ministry of Commerce and Industry are the *École centrale des arts et manufactures*, for the training of industrial engineers, works managers, etc ; the *Conservatoire des arts et métiers*, which has a rich museum of industrial inventions and provides courses in science as applied to the arts. The *Institut national agronomique*, a higher school of scientific agriculture, is dependent on the Ministry of Agriculture, and the *École coloniale* for the instruction both of natives of French colonies and of colonial functionaries, on the Ministry of the Colonies. The *École nationale des ponts et chaussées*, for the training of Government engineers, and the *École nationale supérieure des mines*. for mining engineers, are under the minister of public works. Of free institutions of higher education, the most prominent are the *Catholic institute*, with faculties of law and theology and schools of advanced literary and scientific studies, the *Pasteur institute*, founded by Pasteur in 1886 and famous for the treatment of hydrophobia and for its research laboratories, and the *École libre des sciences politiques*, which prepares candidates for political and governmental careers. The two latter receive State subvention. There are numerous private associations giving courses of instruction, the more important being the Philotechnic Association, the Polytechnic Association and the *Union française de la jeunesse*.

Among the numerous learned societies of Paris, the first in importance is the Institut de France. (*See* ACADEMIES) The French Association for the Advancement of the Sciences, founded in 1872, is based on the model of the older British society, and like it, meets every year in a different town. There are very numerous specialist societies promoting the various branches of learning. In art, also, Paris has long held a leading position; her artistic activities are described under various departments of art.

Charity.—The administration of public charity is now entrusted to a responsible director, under the authority of the Seine prefect, and assisted by a board of supervision, the members of which are nominated by the president. The funds at his disposal are derived: (1) from the revenue of certain estates, houses, farms, woods, stocks, shares; (2) from taxes on seats in the theatres (one-tenth of the price), balls, concerts, the mont de piété (the public pawnbroking establishment), and allotments in the cemeteries; (3) from the municipal subsidy; (4) from other sources (including voluntary donations). The charges on the administration consist of. (1) the treatment of the sick in the hospitals; (2) the lodging of old men and of incurables in the *hospices;* (3) the support of charity children, (4) the distribution of outdoor relief (*secours à domicile*) by the *bureau de bienfaisance* of each arrondissement; (5) the dispensation of medical assistance *à domicile;* (6) asylums for mental cases

The doctors, surgeons, chemists, both resident and non-resident, connected with the numerous hospitals, are all admitted by competitive examination. They are assisted by three grades of students, *internes* (who receive a salary), *externes* and *stagiaires* (probationers).

Of the *hospices* and similar institutions, the following are the chief: Bicêtre (men), less than a mile south of the fortifications, La Salpêtrière (women), Ivry (both sexes), *maisons de retraite* (for persons not without resources) Issy, La Rochefoucauld, Ste Périne; *fondations* (privately endowed institutions)—Brézins at Garches (for ironworkers), Devillas, Chardon-Lagache, Lenoir-Jousseran, Galignani (booksellers, printers, etc.), Alquier-Debrousse; and sections for the insane—Bicêtre (men), Salpêtrière (women), these being distinct from the ordinary departmental asylums controlled by the prefect.

Foundlings and orphans are sent to the *Hospice des enfants assistés*, which also receives children whose parents are patients in the hospitals or undergoing imprisonment This institution is not intended as a permanent home Infants are not kept in the institution, but are boarded out with nurses in the country; the older ones are boarded out with families or placed in technical schools. Up to 13 years of age the children are kept at the expense of the department of Seine, after which they are apprenticed

The following additional establishments in or near Paris belong to the nation, and are dependent on the Ministry of the Interior The Quinze-Vingts gives shelter to the 300 blind for whom it was founded by St. Louis, and gives outdoor assistance besides The blind asylum for the young (*Institution des jeunes aveugles*) has 250 pupils of both sexes The deaf mute institution (*Institution nationale des sourds-muets*) is for boys only, and they are generally paid for by the State, the departments and the communes. The Charenton asylum is for the insane Those of Vincennes (for male patients) and Le Vesinet (for female patients), take in convalescents from the hospitals The Vacassy asylum at Charenton is for workmen incapacitated by accident. The *Hôtel des invalides* is for old and infirm soldiers Private bodies also maintain a great number of institutions

Religion.—A large element of the population practises the Roman Catholic faith. The department of Seine forms the diocese of the archbishop of Paris, and the city is divided into 70 parishes It has the important higher ecclesiastical seminary of St. Sulpice, two lower seminaries and others for training the clergy for missionary and colonial work Paris is also the seat of the central council of the Reformed Church and of the executive committee of the General Synod of the Lutheran Church, and forms a consistory of both these Churches Paris is also the seat of the Grande Rabbinate of France and of the central consistory

HISTORY

Gallic and Roman Periods.—Paris grew up at the intersection of two great natural highways, one of them leading from the Rhine district to the south by way of what is now the rue Saint-Martin on the right bank of the Seine and the rue Saint-Jacques on the left bank, and the other being the river itself. The land route crossed the Seine at the point where it was most easily forded—the Ile de la Cité. Paris thus sprang up on the natural stronghold of the island. It was at first a fortified town of the Gallic tribe of the Parisii. It was called Lutetia, and was connected with the two banks of the river by two wooden bridges where the Pont Notre-Dame and the Petit-Pont now stand. Caesar describes in his *Commentaries* how it was burnt during the Gallic War of Independence (52 B.C.).

During the 1st century A.D. we hear of Lutetia as a Roman town. Its character has now changed. The original island was about half the size of the modern Ile de la Cité, and was liable to be flooded by the river; it was not a normal site for a town, and could only have been selected for defensive reasons. Under the *pax Romana* Lutetia spread beyond its island to the Montagne Sainte Geneviève which lay opposite it on the left bank; on the right bank there was only low-lying and uninviting ground, bounded by a semicircle of hills—those of Charonne, Ménilmontant and Belleville to the east, Montmartre in the north and Chaillot to the west. A new Roman city grew up on the northern slopes of the Montagne Sainte-Geneviève, with the straight roads and the public buildings characteristic of all Roman towns —the thermae or public baths, probably on the site of the Musée de Cluny, the theatre, about where the boulevard Saint-Michel crosses the rue Racine, and the arena on the site of the square which now bears that name. The town was supplied with water by the aqueduct of Arcueil. Lutetia was extended up the hillside, and was unfortified; its cemetery was by the side of the Roman road later to become the rue Saint-Jacques.

Lutetia was destroyed by the barbarian invasions of the 3rd century, but reappeared towards the end of the century on its original site, the Ile de la Cité, with its natural defences. A hastily erected rampart supplemented the protection afforded by the two branches of the river. The town was concentrated in this narrow space the better to resist attack. It had straight streets, and a few public buildings. There was probably a temple at the eastern end, and a palace, the headquarters of the Roman authorities, at the other end. There were two wooden bridges opposite what are now the rue Saint-Martin and the rue Saint-Jacques. The name of the town changed from Lutetia to Paris. This stronghold was built for protection against the dangers of the time, for it lay on the route followed by the barbarians on their way from the north to the south.

Christianity reached Paris from Lyons. The earliest Christian community or village was situated on the road from Lyons to Paris, near a ford over the Bièvre, at a place where there were stone quarries which had been worked since early Roman times. The spot was near what is now the carrefour des Gobelins, where a Christian cemetery has been discovered with tombs the earliest of which date from the end of the 3rd century. In the following century Christianity gained a footing in the city itself.

THE MIDDLE AGES

In the 5th century the Franks made themselves masters of Paris; they did not, however, destroy the Roman civilization, but were themselves influenced by its more advanced culture. Under Clovis they became converted to Christianity and thus came doubly under the influence of Rome. By his victory over the Visigoths in A.D. 508, the Frankish leader made himself the ruler of the south of France. He established his capital at Paris in order to bring the seat of his authority nearer to the newly conquered territories.

Paris was now a royal and episcopal city, and churches began to be built on both banks of the Seine. These were the first buildings on its banks; houses later sprang up around them. Clovis and his wife Clothilde built a church dedicated to the Apostles on the left bank, on the top of the hill overlooking the Ile de la Cité, on the Lyons road. In the 6th century the relics of Sainte Geneviève were deposited in this church, which became the abbey of Sainte-Geneviève, behind where the Pantheon now stands. On the same bank, further west Childebert, one of the sons of Clovis, built a basilica in which Saint Germain, bishop of Paris, was buried towards the end of the 6th century. This later became the abbey of Saint-Germain-des-Prés, the church of which still exists to-day. Another bishop of Paris, Saint Marcel, was buried during the 6th century on the banks of the Bièvre, in the village where the first Christian community was situated. This village later developed round the collegiate church of Saint-Marcel. During the same century two churches were built on the right bank of the river: that of Saint Gervais and Saint Protais on a little hill by the Seine, and that of Saint Laurent beyond the low-lying ground to the north of the river, near the modern Gare de l'Est. Many more churches were built in the following centuries; they were particularly numerous in the Ile de la Cité, and many more sprang up along the two great roads on either side of the river.

Although the Ile de la Cité, which at that date was practically the whole of Paris, had a comparatively large number of buildings, there were few dwellings on the banks of the Seine except some houses round the religious establishments or beside the roads. There were patches of cultivated land, vineyard and meadow amidst a setting of waste ground and forest. In the 9th century the bridge over the wider of the two arms of the river was not situated where the Pont-Notre-Dame now stands, but nearly on the site of the Pont-au-Change. Where it touched the right bank, a road came into existence leading towards the great abbey of Saint-Denis; this later became the rue Saint-Denis. This bridge and the Petit-Pont were protected at each end by a fortified tower, the most important of which was that on the right bank which guarded the entrance to Paris on that side. It was called the Porte de Paris.

During the Norman invasions of the 9th century, the fortified Grand-Pont was of great importance for defensive purposes when Paris was besieged in 885 and 886. The Norman invasions hastened the advent of the feudal system. Moreover, the Mediterranean, which in ancient times had been the means of communication between west and east, and where the Byzantine empire held the former place of Rome, was transformed during the 8th century into a Saracen lake from which Christendom was shut off. Communication between different parts of the world became much more restricted, and each feudal domain tended more and more to be its own narrow world. Paris at this time may be regarded as the juxtaposition of the centres of a number of great domains—principally ecclesiastical domains—in fact, a sort of feudal mosaic. But after the accession of the Capetian dynasty in 987, the feudal suzerain was at the same time the king of the country, and the more the monarchy increased in power and extended its influence over France, the more Paris grew in importance.

Growth.—In the 11th century the channels of human intercourse began to be opened up once more and to exercise their life-giving influence. The population of Paris increased. The close organization of feudalism began to relax. It was at this time that the earliest of the guilds were formed in Paris, among them that of the river traders who plied up and down the Seine. With the growth of commerce during the 11th century there came into being a mercantile quarter near the Porte de Paris, bounded by the latter on the west, Saint-Merri on the north and Saint-Gervais on the east. This mercantile quarter might be regarded as deriving its origin from the intersection of the course of the river and the land route represented by the two streets of the rue Saint-Martin and the rue Saint-Denis. In the 12th century it was surrounded by a rampart, and contained the market,

situated on the Grève, where the Hôtel de Ville now stands. Louis VI. (1108–37) transferred the market to the site near the rue Saint Denis now occupied by the Halles Centrales. The Grand-Pont, on which the money-changers had their shops, became the Pont-au-Change in 1142.

Paris now began to grow rapidly. A parish was formed near the priory of Saint-Martin-des-Champs; about 1080 the priory church was also the parish church, but early in the following century the functions of parish church were transferred to the neighbouring chapel of Saint-Nicolas-des-Champs. The road to Saint-Denis, of which the street of that name forms part, increased in importance; from early in the 12th century the Lendit fair was held along this road, between Saint-Denis and Paris. The Paris leper hospital, which bore the name of Saint-Lazare, was on this road; its existence is first mentioned in 1122. It occupied the site of the modern prison of the same name. Further to the south the church of the Innocents, which was built about 1150, and the abbey of Saint-Magloire, founded at about the same period, bear witness to the increasing population in the neighbourhood of Louis VI.'s new market. To the east, a new centre of activity was created towards the end of the 12th century by the foundation of the Temple, south of the site now occupied by the place de la République. The Couture du Temple is mentioned in 1184, and the Ville Neuve du Temple came into existence in the following century. The church of Saint-Paul, near the corner of the street of that name and the rue Saint-Antoine, is first mentioned in 1136, and the township (bourg) of Saint-Paul came into being in the next century. Rural settlements gathered round the churches and abbeys; for example the small village of La Villette-Saint-Ladre grew up in the second half of the 12th century on the land of the Paris leper hospital. This is the origin of the modern district of La Villette. About the middle of the century the land which lies beyond where the chief boulevards now are and almost as far as Chaillot, which had been used as public pasturage, was brought under cultivation and formed the beginning of the ring of vegetable gardens which surrounds Paris, but has been driven farther and farther out with the growth of the city. By about 1110 there was a township around the church of Saint-Germain-l'Auxerrois; like the church itself, it was dependent on the bishop of Paris. About 100 years later there was in addition to the old Bourg de Saint-Germain-l'Auxerrois or Bourg de l'Evêque, prolonged towards the west, a new Bourg de l'Evêque.

It was, however, to the mercantile quarter near to the island city that the right bank principally owed its development; it thus acquired the character of the central business quarter which it has retained to the present day. This was strictly speaking the Town, as opposed to the left bank, which came to be called the University, the latter having been founded there early in the 13th century and having at once taken possession of it. Thus there is an organic division, corresponding to the natural division of the site of Paris, which accounts for the old expression "the Town, City and University of Paris."

About 1175 there existed at the foot of the Châtelet of the Petit-Pont a township which was a fief of the abbey of Saint-Germain-des-Prés. Another township clustered round the abbey itself. The district to the west of the Petit-Pont came under the feudal overlordship of the same abbey, while the district to the east was subject to the abbey of Sainte-Geneviève, which also had a township gathering round it; on the bank of the Bièvre was the village of Saint-Médard, and still farther to the south the township centring round the collegiate church of Saint-Marcel. The abbey of Saint-Victor, founded during the reign of Louis VI., formed yet another nucleus of rural population in the neighbourhood of what is now the Halle aux Vins. The church of Notre-Dames-des-Champs, situated in the cultivated land on the plateau by the road which continued the rue Saint-Jacques, also formed the centre of a small cluster of rustic houses. This bank of the river was mainly devoted to the cultivation of the vine.

Later, however, the various groups of buildings were enclosed within a rampart; it was built by Philip Augustus, and dates from 1190 on the right bank and about 1209 on the left bank. To describe its course in terms of present-day Paris, the wall on the right bank started from the end of the Pont-des-Arts in front of the Louvre, reached the rue Saint-Honoré opposite the Oratoire, and thence ran parallel to the rue Jean-Jacques Rousseau as far as the rue Montmartre, whence, following the direction of the rue Etienne-Marcel, it reached the rue Saint-Martin. Thence it bent in the direction of the rue des Francs-Bourgeois, and thus, passing by the southern end of the rue de Sévigné, reached the rue Saint-Antoine and the Seine. The gates were situated at the position of the present-day rue Saint-Antoine, rue Vieille-du-Temple, rue Saint-Martin, rue Saint-Denis, rue Saint-Honoré and quai du Louvre. Outside the rampart, in the south-western part of what is now the courtyard of the Louvre, was a tower of defence which Philip Augustus called "our tower of the Louvre." This is the origin of the palace of that name. The wall on the left bank ran in the direction of the rue des Fossés-Saint-Bernard, touched the place du Panthéon on the south, cut through the rue Soufflot and ran parallel to the rue Monsieur-le-Prince, rue de l'Ancienne Comédie and rue Mazarine, to the east of those streets.

New churches were erected about this time at the points where the town was growing. On the right bank of the river, Saint-Honoré was built early in the 13th century in the street of the same name, opposite where the Magasins du Louvre now stand; Saint-Eustache was built in 1223 at the point where the rue Montmartre met the rue Montorgueil, by which sea fish arrived in Paris. On the left bank there were Saint-Sulpice, first mentioned in 1211, and Saint-André-des-Arts, built about 1215. Saint-Etienne-du-Mont was built in 1222 to serve the growing parish around the abbey of Sainte-Geneviève. Finally, Saint-Nicolas-du-Chardonnet (1243) was erected farther east as the parish church for a population which, here as elsewhere, had increased as a result of the building of Philip Augustus' fortifications The left bank was more particularly the domain of the Church, on which the University was dependent. It was here that the four mendicant orders established themselves—the Preaching Friars or Jacobins in 1219 near the corner of the rue Saint-Jacques and the modern rue Soufflot; the Cordeliers in 1230 in what is now the rue de l'Ecole-de-Médecine; the Austin Friars in 1293 on the quai des Augustins, named after them; the Carmelites in 1319 in the place Maubert. The Carthusians settled in 1259 on the site of the modern avenue de l'Observatoire. A large number of colleges were established on the left bank of the river in the second half of the 13th century and the 14th century, among them the college founded in 1257 by Robert de Sorbon and named after him the Sorbonne.

The opposite bank was the centre of activity of the trades. Towards the middle of the 13th century there grew up the first municipal authority: the *Prévôté des marchands*. Its headquarters, the *Parloir-aux-Bourgeois*, was near the Châtelet. The latter was the seat of the administration of the provost of Paris, who represented the royal authority. The centre of commercial activity on the Seine later shifted to the Grève, and in consequence the *Parloir-aux-Bourgeois* was transferred there in 1357, to the site which has ever since been occupied by the *Hôtel de Ville*. The kings of France also contributed to the making of the right bank, adding the royal to the commercial element. Charles V. (1364–80) built the Hôtel Saint-Paul, which was his favourite residence, south of the rue Saint-Antoine. No trace of it remains. From that time onwards the kings no longer made the palace in the city (now the *Palais de Justice*) which had been rebuilt by Philip the Fair, their habitual residence. Charles VI. lived in the Hôtel Saint-Paul, and his successors in the Hôtel des Tournelles, near the modern place des Vosges. After the death of Henry II. (1559) the kings took up their residence in the Louvre, thus transferring their favour from the east of Paris to the west—a fact to which the development of the west of Paris is entirely due. The fortunes of Paris were as a matter of fact closely bound up with those of the French monarchy. It was the fact that Paris was the royal capital which, from the 12th century onwards, conferred on it a peculiar lustre. Manners became more refined, and the city came to be an intellectual and artistic centre in which crafts of all kinds flourished.

Political Struggles.—The Black Death and the Hundred

Years' War interrupted the prosperity of Paris in the 13th and early 14th centuries. The political life of the city began in the 14th century; in the time of Étienne Marcel it was for a time a revolutionary commune, and it subsequently felt the effects of the reconstruction policy of Charles V. This king rebuilt the Louvre, which he made into a magnificent palace, though he still preferred to live in the Hôtel Saint-Paul. He also built a new line of fortifications to contain the part of the town on the right bank which had outgrown that on the left. The number of gates in the old rampart had already been increased because the town on the right bank had spread beyond it. The new fortification, described in terms of modern Paris, started from the Pont du Carrousel, crossed the square of that name, and cut through the south-east of the Palais-Royal to reach the place des Victoires. Thence it ran almost in a straight line to the Porte Saint-Denis, and thence to the place de la Bastille, following the direction of the main boulevards, but a little farther to the west. It had six gates: Saint-Honoré, Montmartre, Saint-Denis, Saint-Martin, Temple and Saint-Antoine, where there was a large *bastide* or fortress to protect the gate. This was the Bastille, built in 1370 on the western part of what is now the place de la Bastille, captured by the populace on July 14, 1789, and then destroyed. In the east the rampart enclosed the marshes of the Temple, and consequently this part of Paris was formerly known as the *Marais* (marsh). Other bridges were built in addition to the Pont au Change and the Petit-Pont: the Pont Saint-Michel about 1380, and in 1413 the Pont Notre-Dame, so called by Charles VI.

Paris was again troubled by revolutionary agitation in 1382 as a result of the imposition of taxes; the revolt of the Maillotins was repressed with great severity in Jan. 1383. As a result, Paris lost its municipal régime, which was not restored until 1412. Further disturbances were caused by the struggle between the Burgundians and the Armagnacs, which followed on the madness of Charles VI. Paris fell into the hands of each party in turn, was subjected to the violent rule of the butchers and skinners under Caboche, became involved in revolution, called in Capeluche and his bands, and fell into a state of starvation. The English invasion and the Anglo-Burgundian alliance made matters worse. The English entered Paris, and the duke of Bedford, at the Hôtel des Tournelles, acted as regent for the young Henry VI., king of England and France (1422). Joan of Arc attempted in vain to recapture Paris in 1429. It was not until 1436 that the capital once more came into the possession of the king of France, Charles VII. These successive disturbances resulted in greatly reducing the population of Paris and in introducing foreign elements. Its prosperity suffered greatly.

FRANCIS I. TO LOUIS XVI.

Francis I. made extensive alterations in the Louvre so as to make it suitable for the royal palace (1528). In his reign the town increased in size; and it began to be adorned with buildings in the Renaissance style. A new Hôtel de Ville was begun, and at the same time Saint-Eustache and Saint-Etienne-du-Mont were rebuilt, as well as Saint-Merri and Saint-Gervais; but in the two latter churches the Gothic style survived. The population of the suburbs increased. The Faubourg Saint-Germain, under the influence of the neighbourhood of the Louvre, became an aristocratic quarter. The need of a new enclosing wall made itself felt; the lines of this were laid down in the 16th century, but it was not built until the reign of Louis XIII., and then only on the right bank of the river. It was in the reign of Francis I. that Protestantism was introduced into Paris and the royal authority made its first efforts to stamp it out.

Renaissance and Reformation.—Henry II.'s solemn entry into his capital in 1549 marks the triumph of the Renaissance in Paris. Jean Goujon's *Fontaine des Innocents* dates from the same year. Modern Paris now came into existence. Work on the Louvre was continued, and Catherine de Médici began the construction of the Tuileries in 1564. It was as though temples were being built to the new divinity, the monarch. Towards the end of the 16th century the gardens of the Tuileries began to be the meeting-place of the polite world; this was a custom of Renaissance origin. The influence of the court spread over Paris, and with it the Renaissance spirit. Increased refinement of manners was the result. The Pont-Neuf, which was begun in 1577 and completed under Henry IV., was the first classical bridge to be built in Paris. Quays were constructed in the 16th century, and an effort began to be made to set out the streets in line. It was the king's wish that new houses should have their façades made of stone and not of wooden beams and plaster. Paris began to wear the external characteristics of the capital of the absolute monarchy. The first theatre was built in 1548; it was known as the Théâtre de l'Hôtel de Bourgogne, in the rue Française.

The wars of religion did not spare the capital; on the Day of Barricades (May 12, 1588) it parted company with king Henry III., and was besieged by Henry IV. Poverty and hunger prevailed, and Paris was given over to the terrorism of the Sixteen —adherents of the *Ligue* representing the 16 districts. On March 22, 1594, the city once more came under the authority of its sovereign; and the monarchical era, which coincides with the classical age, entered upon its course. Henry IV. built the place Royale (place des Vosges) and the place Dauphine, as well as the quai de l'Horloge and the quai des Orfèvres. The building of the place Royale resulted, under Louis XIII., in the building over of the marshes which formerly lay to the north of it; the whole became the aristocratic quarter of Paris during the 17th century. The Pont-Neuf, on which a statue of Henry IV., the first statue to be erected in a public place in Paris, was set up in 1614, became one of the centres of the life of the city. It was also in the reign of Henry IV. that the work of joining the Louvre to the Tuileries, begun in 1566, was completed, the hospital of Saint-Louis was built for plague patients, and a supply of spring water, which had been brought to the right bank at the end of the 12th century, was carried over to the Île de la Cité. The left bank was not supplied with spring water until the reign of Louis XIII.

Under the latter king, Paris increased still further in size. Straight streets were laid out towards the edge of the town. Two uninhabited islands in the river were built over and became the Île Saint-Louis. It was connected with the two banks of the Seine by the Pont de la Tournelle and the Pont-Marie. The Pont-au-Double was built in 1634 between Notre-Dame and the left bank. In 1632 a wooden bridge was erected opposite the rue de Beaune to carry the traffic of the growing Faubourg Saint-Germain. The rue Neuve-Saint-Louis was built out over the river along the southern side of the Palace in 1622, and the rue and quai de Gesvres in 1642. In 1631 the western suburbs on the right bank were attached to the town, and a new line of fortifications with bastions was constructed. It followed the line of the old rampart until the Porte Saint-Denis; thence it was carried westward to what is now the corner of the rue Royale and the rue Saint-Honoré, and then ran along the western side of the Tuileries garden. To the west of the Tuileries garden the regent, Marie de Médicis, laid out the Cours-la-Reine, where the carriages of the fashionable world used to drive. The same queen built the Luxembourg palace (1615), and Cardinal Richelieu the Palais-Royal (1636); both of these palaces had gardens which were frequented by fashionable society. The Jardin des Plantes also dates from the reign of Louis XIII. During his reign a number of monasteries and convents were also established at Paris. Of the religious institutions built at this time, there still remain les Carmes (1613), the Oratoire (1621–30), Saint-Louis-des-Jésuites (1627–41), la Visitation (1634), le Val-de-Grâce (1645), Port-Royal (now the Maternité), Sainte-Elisabeth, les Petits-Pères (Notre-Dame-des-Victoires), the Assomption, etc.

Louis XIV.—The Fronde was a leading event of the minority of Louis XIV. Paris was in such a disturbed state that the court was obliged to leave the town in Jan. 1649. The king returned in Oct. 1652. In the period following Mazarin's death in 1661, Paris became the triumphant capital of a victorious and all-powerful monarch. The Louvre, work on which had been resumed in 1624, was completed by the magnificent colonnade (1667–74). The Tuileries palace was altered, completed and sumptuously decorated; its gardens, transformed by Le Nôtre, were prolonged beyond the Paris boundaries by the tree-planted avenues

f the Champs Elysées (1667). The line of fortifications, with s bastions, was replaced by a rampart along which were planted :ees so as to form a walk; this was the origin of the Grands oulevards (1670). The rampart was pierced by the Porte Saint)enis (1672) and the Porte Saint-Martin (1674) in the form of :oman triumphal arches. Both arches still exist. Other trimphal monuments were the place des Victoires (1686) and the lace de Vendôme (1699), each containing a statue of Louis XIV.)n the left bank, the Collège des Quatre-Nations (1662–74; the ıodern Institute), endowed by Mazarin's will, and open to young ıen from four recently conquered countries, and the Hôtel des nvalides (1670) formed a counterpart to the Louvre and the 'uileries opposite and were yet another testimony to the glory of ıe king of France. The Faubourg Saint-Germain was adorned ith a stately line of *quais*, and in 1685 the Pont-Royal was built ɔ take the place of the wooden bridge opposite the rue de ieaune. On the left bank the Cours was laid out, corresponding ɔ the line of the great boulevards on the other side; thus the outh part of Paris, which had remained within the limits of 'hilip Augustus' fortifications, was enlarged. The quai Peletier 'as built along the Seine between the Pont Notre-Dame and the irève (1673). Many of the streets were widened. The first arracks were constructed. The Observatory was built in 1667–72. n 1667 the Gobelins manufactory was organized. Various academies were added to the Académie Française owing to the inreasing centralization which was taking place round the monrchy. Everything tended to gravitate towards the *Roi Soleil.* 'he number of districts into which the town was divided was aised from 16 to 20 in 1702. But Louis XIV. transferred the seat f the monarchy to the palace which he built at Versailles.

The 18th Century.—In the nonage of Louis XV. the Tuileries, ow the royal residence in Paris, was occupied for a few ears. This encouraged urban development in the neighbourhood f the Tuileries. The Faubourg Saint-Honoré increased in size uring the 18th century, and became, like the Faubourg Saint-iermain, an aristocratic quarter. The rue Royale was made in 732, and the place Louis XV. was laid out around the statue f that king which was set up in 1763. This later became the lace de la Concorde. The construction of the parish church of he Madeleine was begun in 1764 at the end of the rue Royale, nd the Pont Louis XVI , now the Pont de la Concorde, was built ı 1787. The great boulevards now began to be bordered with ıouses, including some fine mansions, and the eastern part of hem became a fashionable promenade. Small theatres and cafés dded to the animation of this part of the boulevards. Paris now pread even beyond this limit; the rues de Provence and d'Artois or Laffitte) were laid out in 1770, the rue Taitbout in 1773, the ue Chauchat in 1779, the rue Richer in 1782 and the rue Le 'eletier in 1786. Villas built by nobles and financiers were cattered about this outlying part of Paris. Elegance and easy njoyment of life were the outstanding characteristics of the age. ıbout 1780 the Comédie-Italienne was built on the site which had ıeen occupied by the Hôtel de Choiseul, where the Opéra Comique ıow stands. New streets were constructed in its neighbourhood.)n the former site of the Hôtel de Condé, now occupied by the)déon, was built the Théâtre-Français, which was opened in 1782. n front of it was a semicircular open space from which streets adiated. On the left bank the work of laying out the Cours and ılanting it with trees was continued, and houses were soon built .long it. This was the beginning of the line of boulevards vhich was only completed under the Second Empire. The Ecole Ailitaire, with the Champ-de-Mars, dates from 1751. The Ecoles le Chirurgie (now the Ecole-de-Médecine) were built about this ime, and also the Monnaie (1771) on the quai Conti and the 'alais-Bourbon, now the Chambre des Députés, on the quai l'Orsay. Soufflot built a new church (now the Panthéon) for the bbey of Sainte-Geneviéve, and Saint-Sulpice, which had been ıegun about 1640, was completed. The Petit-Châtelet was lemolished and replaced by a quay (1782) on the left bank; the irand-Châtelet on the opposite bank did not disappear until early n the 19th century. The houses on the bridges were demolished n 1786–88: some however. remained until 1808. Water was supplied to both banks by the two fire pumps of the brothers Périer (1779 and 1787) which were the precursors of steam-driven machinery. The garden of the Palais-Royal, round which the duke of Orleans built arcades in the reign of Louis XVI., became a centre of Parisian life. The *octroi* wall of the *fermiers généraux*, built about the same time, bore witness to the growth of Paris.

PARIS SINCE THE REVOLUTION

The Revolution brought about the unification of Paris, in which traces of the old feudal domains had survived until that time. It set the seal on the age-long tendency towards centralization in France, and thus increased the importance of the capital. The days of Oct. 5 and 6, 1789, brought the king back to the Tuileries and thus put an end to the duality between Versailles and Paris. The Assembly followed the king, and set up in the riding school close by, near the present rue de Rivoli. The Jacobin club had its headquarters not far off in an old convent of the order of that name, while the Cordeliers' club occupied another convent in what is now the rue de l'École-de-Médecine. After the storming of the Tuileries by the populace on Aug. 10, 1792, the royal family was imprisoned in the Temple. Louis XVI. was guillotined on the place de la Révolution (place de la Concorde) on Jan. 21, 1793. The Terror prevailed until it was ended by the 9th Thermidor (July 27, 1794). The love of amusement then began to revive; the boulevard des Italiens began to be a haunt of the fashionable world, and continued to be so until the reign of Napoleon III. The boulevard du Temple on the other hand, where most of the small theatres were situated, was the resort of the populace.

The consulate was now established, and Bonaparte, as first consul, took up his residence in the Tuileries. This was the reason for the construction of the rue de Rivoli with its arcades (1801). In 1806 Napoleon ordered the triumphal arches of the Carrousel and of the Étoile to be set up; the latter was not completed until 1836. The fountain of the Châtelet, surmounted by a triumphal column, dates from 1806, and the Vendôme column was inaugurated on Aug. 15, 1810. The Madeleine was completed to serve as a temple to Glory. The neo-classical style began to give Paris an antique aspect; the city became, so to speak, the imperial Rome of a new Caesar. The Bourse was constructed in the style of a temple (1808–26). At the same time, however, the first iron bridges were constructed—the Ponts des Arts and d'Austerlitz. The Pont d'Iéna was also built in the time of Napoleon I., who likewise brought the water of the Ourcq to Paris and constructed the canal of the same name. The first public slaughter houses were established. Large cemeteries were laid out beyond the boundaries of the town. The Halle aux Vins, which dates from the time of Louis XIV., received approximately its present form. The first French industrial exhibitions were organized at Paris in 1801.

Machinery and other new processes and products now began to come into use. Large-scale industries began to grow up under the Restoration; the earliest social effects of this development made themselves felt in the reign of Louis-Philippe, and may explain the Revolution of 1848. Economic centralization began to take place. Paris received its first railway in 1837; it ran to le Pecq, near Saint-Germain. The use of gas for lighting purposes began under the Restoration. At this period and under Louis-Philippe there was a great deal of building on the outskirts of Paris—the districts of François I[er] (1823) and Beaujon (1825–42), that of l'Europe (1826–47) and that of Notre-Dame-de-Lorette came into existence. This was the time when covered passages, the first of which was that of the Panoramas (1800), were in fashion. Many bridges were built: the Ponts des Invalides, du Carrousel, d'Arcole, de l'Archevêché, Louis-Philippe and de Bercy. Omnibuses began to run in 1828. In 1840 fortifications were constructed beyond the *octroi* wall of the *fermiers généraux,* though the latter continued to form the limit of the town. A column commemorating the Revolution of 1830 was set up in the place de la Bastille, and in 1836 the Luxor obelisk was erected in the place de la Concorde.

Paris had in many respects retained the characteristics of a mediaeval city. It was Napoleon III. who, with the help of

Haussmann, the prefect of the Seine, really made it into a modern town. He was the creator of Paris as it exists to-day. The railway stations, which were now the real gates of the city, were provided with the main streets necessary to give access to them. These included the boulevard de Strasbourg and the rues de Rennes, Auber and de Lyon. A new intersection of routes was created between the boulevards de Strasbourg, Sébastopol, du Palais and Saint-Michel and the rue de Rivoli. The Halles Centrales were constructed and provided with the necessary means of access. The great cross-roads of the place de la République were created. The Opéra became another great meeting-place of roads. The Etoile, with its great system of radiating main roads, was laid out, and a corresponding system of radiating roads, starting from the place de la Nation, was planned at the other end of Paris. The Louvre was completed. The houses of the Cité gave place to public buildings. Wide streets were cut through the town on the left bank of the river. The population was provided with open spaces in the form of the Bois de Boulogne and the Bois de Vincennes and the Parcs des Buttes-Chaumont, de Montsouris and Monceau. Many squares were laid out on the English model. An immense system of sewers was created. The water of the Dhuys and the Vanne was brought to Paris. The Ponts National, de Solférino and de l'Alma and the viaduct of Auteuil were constructed. New parish churches were built, including those of la Trinité, Saint-Augustin and Sainte-Clotilde. Paris entered on a period of great brilliance. Universal exhibitions were held in 1855 and 1867. The town spread up to the fortifications (1860) and the old *octroi* wall was replaced by the outer boulevards.

The Tuileries palace was burned in the Commune which followed on the war of 1870–1871. The third republic carried on the work of Napoleon III., directing its attention mainly to the quarters added to the town in 1860. Further universal exhibitions were held in 1878, 1889 and 1900, and these were the occasion for the building of the Trocadéro, the Eiffel tower and the Grand and Petit Palais des Champs-Elysées. The church of the Sacré-Coeur was erected in Montmartre. The Métropolitain railway was constructed. Conditions of life have been radically altered by various modern inventions. Paris has no rival in France as a centre of material and intellectual interests. Commercial establishments have now taken the place of dwelling houses in the centre of the city, and the population has moved farther out, thus greatly increasing the extent of the suburbs. The upper part of the Champs-Elysées is now, like the great boulevards, given over to commerce. The World War transformed Paris into a great industrial centre. The town itself cannot now be distinguished from its suburbs, which have spread disproportionately. The fortifications of 1840 have been demolished. The aerodrome of Le Bourget will be the great terminus of the future. The port of Paris continually grows larger. In the town itself, the great development of motor transport is giving rise to difficult traffic problems. Although only half a century has passed since Haussmann's time, a fresh transformation of Paris is already becoming necessary. (For particulars of the Paris Grand Opéra *see* ACADÉMIE NATIONALE DE MUSIQUE.)

PARIS, a city of eastern Illinois, U.S.A., 10 m. N.W. of Terre Haute (Indiana); the county seat of Edgar county. It is served by the Big Four and the Pennsylvania railways. Pop. 7,985 in 1920 (95% native white) and was estimated locally at over 10,000 in 1928. It is a junction and transfer point on the Big Four, which has repair shops here; ships large quantities of corn and other agricultural products. The city was incorporated in 1853.

PARIS, a city of Kentucky, U.S.A., the county seat of Bourbon county; 18 m. N.E. of Lexington, on Federal highways 27, 227 and 68, and served by the Frankfort and Cincinnati and the Louisville and Nashville railways. Pop. 6,310 in 1920 (25% negroes). It is the trade centre of a section of the blue-grass region.

PARIS, a city of north-western Tennessee, U.S.A., the county seat of Henry county; served by the Louisville and Nashville and the Nashville, Chattanooga and St. Louis railways. Pop. 4,730 in 1920 (26% negroes); estimated locally (after annexations of territory) at 9,000 in 1928, with an additional 3,000 in the suburbs. It is an important shipping point for clay, tobacco, cotton, grain and vegetables, and has large timber interests. The city was founded in 1820 and incorporated in 1823.

PARIS, a city of northern Texas, U.S.A., the county seat of Lamar county; 100 m. N.E. of Dallas and 15 m. from a free highway bridge over the Red river. It is served by the Frisco, the Gulf, Colorado and Santa Fe, the Paris and Mount Pleasant, the Southern Pacific, and the Texas and Pacific railways. Pop. (1920) 15,040 (24% negroes); estimated locally at 20,000 in 1928. It is an important cotton market, sales from wagons aggregating 35,000–50,000 bales in a season; a shipping point for the farm and orchard produce of a wide area; has a large wholesale distributing business, and more than 50 manufacturing plants, with an output in 1925 valued at $5,552,878. The city has an aldermanic form of government in which the mayor functions as city-manager. Paris was settled in 1841, incorporated as a town in 1874, and chartered as a city in 1905.

PARIS, CONFERENCE OF. The conference for framing the treaties which ended the World War was held in Paris in 1919–20.

I. PRELIMINARIES

The Pre-Armistice Agreement.—Germany faced complete defeat and unconditional surrender when, one after the other, her allies Bulgaria, Turkey and Austria-Hungary broke under the strain of war in Sept. and Oct. 1918, and sought terms with the enemy. Germany saw her best chance in overtures to the President of the United States, whose speeches during months past had underlined the principles necessary to the restoration and preservation of world peace (*see* FOURTEEN POINTS). Accordingly, on Oct. 4 the German Government despatched a note to Wilson through the Swiss Government requesting an armistice.

In reply, President Wilson laid down the stipulations that before negotiations for peace could be opened: (1) Germany must accept without qualification the principles of the Fourteen Points, leaving for discussion only the practical details of their application; (2) the German armies must be withdrawn from all territories of the Allies under the direction of the Allied military authorities; (3) Germany must cease all illegal and inhuman practices and abandon unlimited submarine warfare; and (4) the German nation must free itself of the arbitrary Government which had conducted the war. Gen. Ludendorff resigned rather than accede to those conditions, but the civil Government, although it protested against the charges of illegal and inhuman practices, despatched a note on Oct. 20 accepting the stipulations of President Wilson as preliminary to an armistice. Wilson then presented the matter to the Allies. The President had already sent Col. Edward M. House to Paris as American representative on the Supreme War Council. He met with the Allied leaders, Lloyd George, Clemenceau and Orlando, to discuss, first, whether an armistice should be granted, and second, whether Germany's request that the Fourteen Points be used as the basis of peace should be accepted.

President Wilson has been much criticized on the ground that he was responsible for too early a peace, and that had it not been for him terms would have been dictated to Berlin. This is far from the truth. The Allied Council agreed to grant the

ırmistice on the recommendation of the military leaders; the ımericans were in fact less eager than the French and the British or the cessation of hostilities. To be certain of Allied sentiment egarding the Armistice, House asked Marshal Foch directly 'hether or not from a purely military point of view he would refer to have hostilities cease on the terms proposed. Foch eplied that, since the terms demanded of Germany were pracically the same as those that would be demanded at Berlin, he 'as opposed to the useless sacrifice of even one more life. *On ne fait la guerre que pour ses résultats.*"

The Allied leaders were more doubtful whether President Wilon's Fourteen Points should be taken as the basis of the peace, s Germany asked. Clemenceau, Lloyd George, Hymans and)rlando each raised objections. They finally agreed, however, pon the strong insistence of Col. House, to accept the Fourteen 'oints with two reservations regarding the freedom of the seas nd restoration of invaded territory. Acknowledging these reserations, Wilson on Nov. 5 communicated the reply of the Allies o the German Government. This note is of vital importance. It constitutes the formal and written offer of the Allied and ıssociated States to conclude with Germany (*a*) an armistice onvention and (*b*) a treaty of peace. This offer, it is conceived, 'as accepted by Germany by the act of sending representatives, hrough military channels, to meet Marshal Foch for the purpose f arranging an armistice. By the acceptance of the offer a olemn Agreement was reached which served, both morally and egally, as the basis of the armistice convention and the treaty f peace[1]."

The note of Nov. 5, in which Wilson stated that Marshal Foch 'ould communicate the conditions of an armistice, contained the ext of the memorandum of observations by the Allied Governıents on the correspondence between President Wilson and iermany. In this memorandum those Governments "declare heir willingness to make peace with the Government of Germany n the terms of peace laid down in the President's address of an. 8, 1918 (the Fourteen Points), and the principles of settleıent enunciated in his subsequent Addresses," subject to two ualifications. These reserved complete liberty, as regards the freedom of the seas," and interpreted "restoration of invaded erritory" as meaning that "compensation will be made by Gerıany for all damage done to the civilian population of the Allies nd their property by the aggression of Germany by land, by ea and from the air."

Both the Allied and Associated Powers and the Germans ccepted this Pre-Armistice Agreement as the basis of the peace. The protests of the German delegation against the Versailles Treaty in May 1919 were based upon their allegation that the reaty was not in accord with the principles of the agreement. The Allied and Associated powers, although they denied the validty of the allegation, explicitly acknowledged the validity of the ıasis: "The Allied and Associated Powers are in complete accord 'ith the German delegation in their insistence that the basis for he negotiation of the treaty of peace is to be found in the corespondence which immediately preceded the signing of the Armistice of Nov. 11, 1918[2]."

Organization of Peace Conference.—Representatives of he chief Allied and Associated Powers—France, Great Britain, taly, Japan and the United States—held consultations in Dec., ınd the first plenary session of the Peace Conference did not ake place until Jan. 18 1919. President Wilson did not reach Europe until Dec. 13 1918. The British Prime Minister, Lloyd George, was detained at home by the political uncertainties of a general election until after New Year. So important to any negoiations was the participation of these two heads of governments hat nothing definite could be attempted until their arrival. In he meantime, the smaller Powers which had been overrun by the ırmies of Germany had time to reorganize their governments ınd to send plenipotentiaries to the Conference.

The Peace Conference was called by the five principal powers to assemble at Paris. Geneva had been suggested as a neutral meeting-place for victors and vanquished, but the opinion prevailed that the enemy should be excluded from the conference until summoned to hear the terms which must be accepted. Brussels also was suggested in appreciation of Belgium's heroic rôle in the war, but the honour was finally given to France. The war against the Central Powers had been directed from France; there sat the Supreme War Council of the Allies, and upon this the structure of the Peace Conference could best be erected.

II. ORGANIZATION OF THE CONFERENCE

The Council of Ten.—Upon the arrival of Lloyd George in Paris, a meeting of the Supreme War Council was held, Jan. 12, at the Quai d'Orsay. France was represented by Clemenceau and Pichon, Great Britain by Lloyd George and Balfour, Italy by Orlando and Sonnino, the United States by Wilson and Lansing. Though ostensibly an informal conversation among plenipotentiaries of the four leading Powers, the meeting was the occasion of the significant decision to add only the representatives of Japan to the Supreme Council and to exclude all others from the major decisions of the Peace Conference. Thus the Council of Ten sprang from the Supreme War Council. There also came to Paris the representatives of Belgium, Serbia, Rumania, Greece and the other States—32 in all—which had fought against the Central Powers or had broken off diplomatic relations with them. Obviously it was impossible for all to have equal part in determining the conditions of peace. To each, seats and a vote were allotted in the plenary sessions of the conference. Representatives of those states which had remained neutral during the war, and yet had interests to safeguard or to advance at the Peace Conference, were permitted to attend only those sessions which were arranged for discussion of their claims, whenever they were specially summoned by the five chief Powers. It had been the intention of the latter, at first to put on the same footing the new states which were rising from the ruins of the Central Powers. Before the first plenary session, Poland and Czechoslovakia were conceded representation in the conference; but Yugoslavia—including Serbia, Montenegro and the south Slav provinces of Austria-Hungary—was not officially recognized until the end of May, chiefly because of the opposition of Italy.

The Delegates.—Outstanding among the delegates from the smaller Powers were Hymans, Foreign Minister of Belgium; Paderewski, Premier of Poland, and his Foreign Minister Dmowski; and Bratianu, Premier of Rumania. For Serbia and the south Slavs came Pasić, Vesnić and Trumbić. Venizelos came to speak for Greece. For Czechoslovakia came its Premier, Kramarsz, and the brilliant young Foreign Minister, Beneš. The new Kingdom of the Hejâz was represented by the Emir Feisul.

But there was considerable dispute before the five principal Powers finally assigned places in the conference to each state in accordance with its military strength and its share in the war. Five seats were given to each of the five chief Powers; three apiece were assigned to Belgium, Serbia and Brazil; two each to Canada, Australia, South Africa, India, China, Czechoslovakia, Poland, Greece, the Hejâz, Portugal, Rumania and Siam; one each to New Zealand, Bolivia, Cuba, Ecuador, Guatemala, Haiti, Honduras, Liberia, Nicaragua, Panama, Peru and Uruguay. Many delegates were thus left out, but the panel system was adopted so that all Powers could use their plenipotentiaries in rotation if they desired. Representatives of the British Dominions, for example, more than once shared in important decisions of the Supreme Council by reason of their membership in the panel of the British Empire. Other work was found for excess members of several delegations on commissions and sub-committees.

When the plenary assembly of the conference met for the first time on Jan. 18 it proved to be only a body of approval merely passing upon actions that had already been determined in the Supreme Council. Clemenceau was elected president of the conference. A secretariat-general previously selected by the Supreme Council was appointed. A drafting committee was approved, on which had been placed only representatives of the five chief powers. The smaller Powers endeavoured to protest against such

[1]Temperley, *A History of the Peace Conference of Paris*, i., 382.
[2]Reply of the Allied and Associated Powers to the Observations of he German Delegation on the Conditions of Peace.

rigid control by the Five. But at the second plenary session on Jan. 25 Clemenceau bluntly dismissed their objections with allusion to the 12,000,000 soldiers behind the Five Powers.

Administrative Work.—With this matter of authority arbitrarily arranged, the Peace Conference settled to the work of constructing a peace. Peace-making, however, was not to be its sole task. It was obliged also to assume executive duties of tremendous consequence. It must direct the Allied Armistice Commission at Spa. It must set up and control the Supreme Economic Council at Paris. It had to maintain its own authority over Poland, Germany, Hungary, Czechoslovakia and Rumania. The Supreme Council of the Conference administered the Armistice by instructions to Marshal Foch, who in turn forwarded them to the International Commission at Spa. The Allied members of the commission consequently had no authority to make any decision beyond their instructions. They did have full power to explain and to stress important points in the Allied interpretation of the Armistice and, by personal intercourse, to prevail upon the German representatives to accept the decisions of the Supreme Council at Paris. The matters that chiefly concerned the Armistice Commission were: the withdrawal of German forces from the territory of the Allies and their demobilization, the repatriation of prisoners interned in Germany, surrender by Germany of the required amounts of arms, aeroplanes, mercantile and agricultural machinery, railroad equipment, and the delivery of other commodities stipulated in the Armistice.

Supreme Economic Council.—At the instance of President Wilson, on Feb. 8 the Supreme Council resolved to create a Supreme Economic Council of five members each from interested Powers to advise the conference on the temporary economic measures necessary pending the completion of peace negotiations.

At its first meeting on Feb. 17 the Supreme Economic Council decided to co-ordinate the work of all the former war boards and to direct them as sections of its own organization. As a result, matters of food and relief were placed under Herbert Hoover of the United States as director-general; matters of finance, under Norman Davis of the United States; the problems of communications were ultimately assigned to Brig.-Gen. H. O. Mance of Great Britain; raw materials, to Loucheur of France; problems of blockade, to Vance McCormick of the United States; and shipping to Kimball Cooke of Great Britain.

The Supreme Economic Council endeavoured to supply devastated areas with materials necessary for reconstruction and to revive the economic activity of those countries which were victims of the war. It was especially concerned with the problem of relieving the famine-stricken areas of Eastern Europe—a situation recognized as dangerous to political stability and likely to encourage the spread of Bolshevism. It arranged the Brussels Agreement by which Germany was provided with foodstuffs, to carry out that provision in the Armistice which pledged the Allies to revictual Germany in return for cash payments. It delegated to a sub-committee the special task of economic administration in the territories of Germany occupied by Allied armies. It carried on direct negotiations with the German Finance Commission, studied the economic effects of the Allied blockades of a Bolshevist Russia and Hungary, and urged the Supreme Council of the conference to relax those blockades for the benefit of the peoples of other states near by. It relaxed the blockade against Germany and reorganized the transportation systems of Austria, Hungary and Poland.

In short, the Supreme Economic Council under the efficient chairmanship of Lord Robert (Viscount) Cecil, established only as a temporary commission to administer economic affairs until the advent of peace, became one of the most important international bodies directing the reorganization of Europe. After the Treaty of Versailles had been signed, it continued to act as agent for the Allies. The last meeting was held in Feb. 1920.

Hostilities on Eastern Fronts.—The authority of the Peace Conference was menaced seriously not only by the hostility of the enemy, Germany, but by the resistance of the ally, Rumania, and the new governments of Poland and Czechoslovakia. Early in Nov. 1918 hostilities had broken out between the Poles and the Ruthenians in East Galicia, where Polish proprietors constituted a landed minority, and Ruthenian peasants, closely related to the Ukrainians in Russia, were a majority. During Feb. 1919 an Allied Mission intervened, but the Ukrainian commander refused to accept the proposed truce. In March the Supreme Council of the Peace Conference arranged another truce with the Ukrainian commander, and on April 2 set up an Inter-Allied Commission at Paris to arrange the terms of an armistice concerning Eastern Galicia. The Polish delegation rejected this armistice on the ground that Poland's safety required military occupation of East Galicia. The Supreme Council sanctioned the Polish occupation. The status of Eastern Galicia was left for later decision.

To safeguard Poland on its western border, the Peace Conference imposed an obligation upon Germany that had not been stipulated in the Armistice. In Posen, where Germans constituted in large part the class of landed proprietors and Poles were the peasants, local conflicts developed during Dec. 1918 between garrisons and Polish volunteer forces. The Peace Conference finally in Jan. 1919 despatched an Inter-Allied Commission to stop these hostilities and served notice of that intention upon Germany through Marshal Foch. Germany protested, but practically accepted the provisional line of demarcation as laid down by the Allied Commission until the boundaries of Germany and Poland were determined by treaty (*see* below VERSAILLES, TREATY OF). Germany also objected strongly to the transport of Gen. Haller's Polish army from France to Poland via Danzig, on the ground that its presence would prejudice the ultimate disposition of Danzig. The conference forced Germany to admit the technical right of the Allies to use Danzig as such a port of entry to Poland, but allowed Germany to route Haller's army via railroad without touching Danzig.

Still more vexatious to the Peace Conference, perhaps, was the situation that developed in Hungary after the establishment of a Bolshevist régime under Béla Kun and the conflict between Hungary and Rumania. (*See* HUNGARY, *History*.) Other matters to distract the Supreme Council of the Peace Conference from its major task of peace-making were the sharp controversies between Czechoslovakia and Poland over Teschen and between Austria and Yugoslavia over Klagenfurt. The situation in Russia caused much discussion during the first days. Decision was reached on Jan. 22 that all the Russian factions should be summoned into consultation on the island of Prinkipo, in order to determine who was to be responsible for Russian interests at the Peace Conference. But nothing came of the effort. Neither the old Tsarist order, the revolutionary Government of Kerensky, nor the Bolshevist régime of Lenin were represented at the Peace Conference. Nor were the new Baltic States—Finland, Estonia, Latvia, Lithuania—which were breaking away from the old Russian Empire.

Official Language.—Two preliminary questions of procedure for a time disturbed the plenipotentiaries at Paris. What was to be the official language of the conference? Should its proceedings be made public? It was decided that French and English texts, of equal authority, should be presented in the treaty with Germany, which included the Covenant. Italian texts, along with English and French, were presented in the Austrian, Hungarian and Bulgarian treaties; and in all these the French version was declared to prevail in case of divergence. The languages of the enemy states were denied admission to the texts of the treaties. With regard to publicity for the actions of the conference, the decision was reached to withhold details of discussions as much as possible until definite understandings had been secured.

Special Commissions.—Among the special agents established to assist in making a peace were commissions on:—(1) Responsibility for War and Guarantees, with Lansing of the United States as president, and sub-committees on criminal acts, responsibility for war, responsibility for violation of laws and customs of war; (2) Reparation for Damage, with Klotz of France presiding and sub-committees on estimation of damages, financial capacity of the enemy, and means of payment and reparation; (3) International Labour Legislation, with S. Gompers (U.S.A.) presiding (*see* INTERNATIONAL LABOUR ORGANIZATION); (4) Inter-

national Control of Ports, Waterways and Railways, with Crespi of Italy as president and sub-committees on transit and control of routes of communication; (5) Financial Questions, with Montagu of Great Britain presiding, and sub-committees on financial problems preliminary to peace, on monetary questions, enemy debts and so on; (6) Economic Questions, with Clémentel of France as president and sub-committees on permanent commercial relations, tariffs and customs, navigation, industrial property and others; (7) Aeronautics, with Colonel Dhé of France as president; (8) Inter-Allied Naval and Military Affairs, under the presidency of Marshal Foch, which with other associated committees constructed the military and naval and air terms for presentation to the enemy; and (9) The Central Commission on Territorial Questions, over which Tardieu of France presided, to co-ordinate the work of the committees and commissions examining the complex problems of Czechoslovakia, Poland, Rumania, Yugoslavia, Greece, Albania, Belgium, Denmark, the Saar valley and Alsace-Lorraine.

In all of these agencies of the Peace Conference the five Allied and Associated Powers kept for themselves either the entire membership or at least a majority over the smaller Powers.

III. COVENANT OF THE LEAGUE

First and most important of all was the commission on the League of Nations, chosen on Jan. 25 at the second plenary session of the conference upon the recommendation of the Supreme Council. The membership of this commission was drawn from the political leaders of 14 nations. Among them were Lord Robert Cecil and Gen. Smuts of the British Empire, Bourgeois of France, Orlando of Italy, Hymans of Belgium, Venizelos of Greece, Vesnich of Serbia, Wilson and House of the United States. The commission met on Feb. 3, and after daily sessions in the Hotel Crillon (held at hours that did not conflict with the meetings of the Council of Ten) presented to the plenary session of the conference on Feb. 14 the first draft of the Covenant. The usual procedure at the conference, of translating into French when English was used and into English when French was spoken, lengthened the sittings twofold and, while necessary, consumed much time. On the other hand, at the meetings of the commission to form the Covenant for the League of Nations, interpreters, sitting by those who did not speak both languages, kept them informed in an undertone of the progress of the discussion. It was agreed by the commission to use as a basis for discussion the American plan for the Covenant prepared by Wilson and House, which had, by consent, been put into legal phraseology by Sir Cecil Hurst and David Hunter Miller, legal advisers respectively of the British and American delegations. There were difficult problems to solve. The question of political equality and that of having a league with an army at its command to enforce its decisions, advocated by the Japanese and French respectively, caused acrimonious debates.

The debate in the plenary session—the one important discussion in that body throughout the period of the conference—resulted in approval of the principle of the Covenant and brought forward various suggestions for amendment. President Wilson left on the following day for the United States.

The Covenant was revised by the commission and finally approved by the fifth plenary session of the conference on April 28, without change of a single word. It is to be doubted whether there were many sitting at that historic table who realized that with the acceptance of the Covenant a new phase of civilization had begun and that the League of Nations was its keystone. The Covenant specifically provided for safeguarding the Monroe Doctrine against actions by the League; it contained a clause to permit any state to withdraw upon giving notice of its intention two years in advance. The chief objection to the Covenant raised in America was passed over. With the full support of President Wilson, Article X. was retained in the Covenant. *See* also LEAGUE OF NATIONS.

IV. PROGRESS OF PEACE MAKING

Council of Four.—Four days after President Wilson left for the United States, Clemenceau was shot by a fanatic. Although not dangerously wounded, he was confined to his home. Col. House, who had been delegated to take Wilson's place, came to meet him there and, with the return of Lloyd George from England, the same group was reformed which had worked with celerity and success during the Armistice proceedings. Thus the Council of Four took form. The Japanese plenipotentiary, Saionji, held to the policy of standing off when Japanese interests were not concerned, especially when the matters under discussion pertained purely to a European problem.

Upon Wilson's return to Paris (March 14) he replaced House in these informal conferences. The four heads of states abandoned the Council of Ten. It was reduced to the five foreign ministers. Whenever they desired, the Four assumed the authority of the Ten as the Supreme Council of the Peace Conference and drew apart to confer in private. The ministers of foreign affairs continued to sit as a Council of Five, although they were concerned chiefly with minor executive duties and other matters of routine. But, while the Four were still engrossed in negotiation with the recalcitrant German delegation, the Five went ahead with discussion of the terms to be given to Austria. The power of the Peace Conference had been drawn into the hands of four men, and the Italian, Orlando, found that final decision belonged really to the Three—Clemenceau, Lloyd George and Wilson.

No one listened to the arguments of the Four except their interpreter, Capt. Paul Mantoux, and later their secretary, Sir Maurice Hankey, who rendered invaluable service by keeping the minutes of their discussions and by drafting the resolutions upon which they agreed. On occasion, experts were summoned to give data and technical advice. Inter-Allied commissions were formed directly by the Four and ordered to report to them.

National Claims.—When Wilson returned to Paris (March 14) the problem of meeting the claims of France, Italy, Belgium and Japan immediately became acute. The French asked for continued occupation by the Allies of the Rhineland and the bridgeheads of Cologne, Coblenz and Mainz. Unauthorized demands were made for the permanent separation from the Reich of German territory on the left bank of the Rhine. France asked further for complete sovereignty over the Saar Valley, as compensation for its own mines which had been deliberately ruined by the German forces. The French representatives pressed vehemently for "integral reparation," assessment of actual damages done by the enemy and exaction of the total amount in reparation. France supported Poland's claim to complete sovereignty over Danzig and the approaches to that city.

Although at one time (April 7) President Wilson threatened to break off negotiations over these questions and return to the United States without finishing the task of peace-making, compromises that he could accept were found one after another. The scheme for a republic on the Rhine was repudiated, but agreement was reached that the left bank of the Rhine, and a wide strip on the right bank, should be demilitarized and all fortifications razed, and that the Allies should maintain their joint military occupation for 15 years. It was to be continued if France, in the opinion of the Allies, was not then sufficiently secured against an unprovoked attack. The decision to prohibit union of Germany with Austria, described by Tardieu as one of Clemenceau's fundamentals, was inserted in the first draft of the German Treaty in May and remained there in the definite text of June 28.

As for the French claim to the Saar valley, the compromise was reached that France should have full ownership of the coal mines but that, on account of the 650,000 German inhabitants, government of the region should not be given to France but should be put under the control of the League for 15 years. At the end of that time, the inhabitants resident prior to this arrangement should vote for one of three settlements: the *status quo* under the League, union with France or return to Germany. In case they voted for return to Germany, France was to give back the mines and to receive compensation from Germany.

Reparations.—The problem of reparation was not effectively solved by the Council of Four. Many English and American advisers, thinking of Germany's exhaustion, the danger of making

the German people desperate and the mistaken policy of asking that a blank cheque be signed and handed over for the Allies to fill in, urged that Germany be cleared of charges for reparation by payment at once of whatever amount it could produce. The debate ramified into the uncertainties of Germany's capacity to pay and the largest sum for which Germany might be held liable. The French view prevailed. It was agreed that Germany should be held liable to pay to the last cent. The demands of the British and French that pensions should be included in the reparations bill were first opposed by Wilson, but he finally yielded (*see* REPARATIONS). The deadlock over Danzig was broken by Lloyd George, who sought and found a way between Wilson's Thirteenth Point that Poland should have free and secure access to the sea, and British fears that a *Germania irredenta* with 2,000,000 inhabitants might be created. Danzig was to be a free city under the protection of the League of Nations, but Poland was to have access through Polish territory to the Baltic Sea and virtual control over Danzig's interests abroad. Within a week after President Wilson had threatened to leave the conference, these differences had been ironed out so well that the representatives of Germany were invited to appear at Versailles on April 25.

Crises over National Claims.—But another crisis suddenly appeared. The Italians threatened to withdraw from the conference unless their claims to Austro-Hungarian territories were met before the Germans signed the treaty. These claims were grounded upon promises given by France and Great Britain in the secret Treaty of London (April 26, 1915). Orlando went further, however, to claim the city and port of Fiume (*q.v.*) which had not been allotted to Italy by the secret treaty. In this case he argued for the principle of self-determination, although he had opposed the application of that principle to the German population in the Tyrol south of the Brenner Pass. Wilson gave way to Orlando's contention to the extent of agreeing that Italy's northern frontier should be extended to the Brenner. But he resisted the Italian pretensions on the eastern shore of the Adriatic; for they were advanced at the expense of Yugoslavia and Albania. Fiume had a large Slav population and a purely Slav hinterland. It was the natural seaport of the Slav and Magyar regions to the east. Wilson rejected the suggestion that Fiume should be given to Italy in exchange for the Italian renunciation of claims upon Dalmatia under the Treaty of London. On April 23 Wilson publicly declared his reasons for opposing Italian claims. Orlando and his foreign minister, Sonnino, left Paris for Rome, but returned after the conference determined to proceed with the German treaty. They reached Paris on May 7, a day too late for the sixth plenary session, which approved the draft of the treaty, and only a few hours before it was handed to the Germans at Versailles. The Italians were back in the conference, but the question of the Adriatic was not settled.

Meanwhile the claims of Belgium, Yugoslavia and Japan further complicated the situation for the Council of Four. Hymans appeared on April 29 to demand that, as Belgium had been first to suffer in the war, she should be first to receive compensation for war costs. She had been promised as much in the Armistice. He asked that Belgium be given a prior lien upon $500,000,000 of the first cash receipts from Germany and complete settlement of the Belgian account within ten years. Eventually the American view prevailed, that Belgium's case was different from all others. Belgium was practically assured payment of her war costs by receiving a special issue of German bonds and priority on the cash receipts. Serbia immediately asked for $400,000,000, but the Council of Four dismissed that claim summarily.

The Japanese issue, however, could not be settled so easily as the Belgian or the Serbian claims. The Japanese representatives took exception to the suggestion that the German area in Shantung should be handed back directly to the Chinese. Japan claimed Shantung on several grounds, and a secret agreement in 1917 with the Allies had assured Japan that they would offer no objection to Japanese claims in Shantung, although the United States had never been a party to the agreement. Wilson resisted the Japanese claims, but finally accepted a compromise on April 30.

The Italian crisis was threatening to disrupt the conference, and an understanding with Japan was more than ever necessary. It was to the effect that the Japanese were to keep Kiaochow and its adjacent district, with rights also to exploit the mines and railways in the peninsula; but that Chinese sovereignty would be restored over the peninsula of Shantung "as soon as possible." The American President expressed faith in the oral promise of the Japanese that Japan would eventually evacuate Shantung in favour of China and retain there only commercial concessions. The Chinese representatives at the Peace Conference did not have such faith. They refused to sign the treaty with Germany. But they gained a place for China in the League of Nations by signing the subsequent treaty with Austria.

V. TREATY OF VERSAILLES

With these crises over national claims passed, the draft of the treaty with Germany was handed to its chief representative, Count Brockdorff-Rantzau, on May 7, 1919, at the Trianon. Without rising from his chair the German hurled sharp words at the representatives of the Allies for their dilatory methods. In the past six months, he declared, the blockade had caused the deaths of hundreds of thousands in Germany. "Think of that," he said, "when you speak of guilt and punishment." He and his countrymen would accept the liabilities to which they were committed by the Armistice, would share in restoring Belgium and the devastated areas of France. But they and their nation did not hope for a just peace. "We know," he said, "the power of the hatred that we encounter here."

German Objections.—The Germans were given 15 days, and then an extension of time, in which to represent their objections to the terms of the treaty. They complained that the Allied plan for reparations was too severe and claimed the right of appeal from the assessment of the Reparations Commission to some neutral arbitrator. They demanded a plebiscite in Alsace-Lorraine. In place of the Allied arrangement for the Saar valley, they offered fixed annual supplies of coal to France until the French mines should be restored. Instead of giving up Danzig, Memel and West Poland, they offered to make Danzig, Memel and Königsberg free ports under German sovereignty. They demanded that Germany's claim to its colonies should be referred to arbitration. They asked for reciprocity with regard to commerce and goods in transit. They offered to negotiate concerning the League of Nations, provided Germany were admitted immediately, the members of the League were pledged against waging economic war and the Allied Powers also should abolish compulsory military service within two years and disarm themselves. They desired that the armies of occupation should leave German territory within six months after the signing of the treaty. They summed up their criticisms with the charge that the treaty as a whole was inconsistent with the terms of the Pre-Armistice Agreement. Such an imputation was angrily rejected by the Allies, but suggestions were made in the Supreme Council of the conference that the terms of the treaty should be softened.

Movement for Revision.—Lloyd George, backed by members of the British Ministry and representatives of the British Dominions, led the movement for revision. But the dangers of further delay were apparent. The movement for revision came to an end on June 13 with the only consequence that some concessions were made to Germany on minor points.

The Allies maintained their position with regard to reparations and the armies of occupation. They conceded some changes in the Polish frontier, to make it more consistent with ethnographic divisions. They agreed to a plebiscite in Upper Silesia. They withdrew the provision for making the Kiel Canal an international waterway. They intimated that they would open negotiations at once looking toward reduction of their own armaments. They promised to admit Germany into the League, if Germany complied with the terms of the treaty. They invited from Germany an offer (hedged round with many conditions), within four months of the signing of the treaty, of a lump sum to settle reparations. This suggestion was not accepted by Germany.

There was suspense as Count Brockdorff-Rantzau presented the final terms of the Allies to the German Government at Wei-

mar. The Allied Armies of Occupation prepared for a general advance into Germany if the Germans should refuse to sign the treaty. The Scheidemann Ministry resigned on June 20, and the new Premier, Bauer, offered on the next day to sign the treaty without its articles requiring the surrender of war criminals and declaring Germany solely responsible for causing the war. The Allies refused. In this tense situation, the crews of the German battle-fleet scuttled their ships in Scapa Flow. But on June 22 Bauer obtained the permission of the Weimar National Assembly to sign without conditions, and the new German Minister of Foreign Affairs, Muller, with his colleague, Dr. Bell, at last on June 28 signed the treaty in the Salle des Glaces at Versailles.

Subsidiary Agreements.—Dependent upon the Treaty of Versailles, although apparently the result of separate negotiations among the interested Powers, were several other treaties and international agreements: (1) two defensive treaties, each signed by France, first with Great Britain, and next, with the United States. The two latter Powers bound themselves to come to the aid of France in case of an unprovoked aggression by Germany any time within the next ten years. Great Britain made her ratification dependent on that of the United States. The latter refused to ratify, and so both treaties became nugatory; (2) a protocol defining certain ambiguities in the Treaty of Versailles; (3) an agreement among the United States, Belgium, the British Empire, France and Germany to define the nature of the military occupation of the Rhineland; (4) a treaty between Poland and the Allies to assure protection of life and liberty to all inhabitants of Poland without distinction as to birth, nationality, language, race or religion. Similar protection was later secured by the Allied Powers for minorities in Czechoslovakia, Rumania and Yugoslavia, provisions which were not applied to Italy (*see* MINORITIES; ST. GERMAIN, TREATY OF).

Ratification.—The Treaty of Versailles was ratified on July 9 by Germany, and by Oct. Great Britain, France, Italy and Japan also had ratified The exchange of ratifications was delayed for two reasons. First, it was hoped that the Senate of the United States would ratify at least with reservations. Second, Germany must make amends for the destruction of its fleet in violation of the Armistice. On Nov. 19, 1919, the American Senate failed to ratify; but on Jan. 10, 1920, Germany finally signed a protocol to give compensation for scuttling the fleet. Then the exchange of ratifications was made at Paris between the European Allies and Germany, and on Jan. 16, 1920, the League of Nations was formally inaugurated.

VI. OTHER TREATIES

After the Germans had signed the Treaty of Versailles on June 28, 1919, the Peace Conference turned to the problems of Austria, Hungary, Bulgaria and Turkey, over which many of its commissions had been labouring for months. Chiefs of state began to resume their political tasks. Foreign ministers one by one left for home. Power to act in behalf of the respective states, however, was delegated to lesser dignitaries. The organization of the conference remained intact to complete negotiations with the former allies of Germany. Austria was presented with terms drawn on lines similar to those granted to Germany. Her representatives signed at Saint Germain-en-Laye on Sept. 10, 1919 (*see* SAINT GERMAIN, TREATY OF). And in Jan. 1920, Hungary, freed from its Communist régime and from Rumanian control, was accorded terms varying from the Austrian in minor details. The Hungarians signed on June 4, 1920 (*see* TRIANON, TREATY OF THE).

For Bulgaria, a delegation headed by Teodoroff, the Prime Minister, arrived in Paris on July 26, 1919, but did not receive the draft of the treaty until Sept. 19. The Bulgarians delayed their reply more than a month to frame objections; but other than the promise for speedy admission into the League, they got no concessions from the Peace Conference. Further remonstrance from the Bulgarians led Clemenceau to give them ten days to accept or to reject. By this time Teodoroff had lost power in Bulgaria, and Stambuliisky, head of the Agrarian party, had taken control of the Bulgarian Government. On Nov. 27, 1919, at Neuilly-sur-Seine, Stambuliisky signed the treaty as the sole representative of Bulgaria (*see* NEUILLY, TREATY OF).

Following the establishment of the League of Nations on Jan. 16, 1920, the Peace Conference came to an end. Several issues of first importance remained for disposal, among them the problem of the Adriatic and the settlement with Turkey. The plenipotentiaries left these matters, however, to the Conference of Ambassadors or to negotiation among the interested states. (*See* AMBASSADORS, CONFERENCE OF.) Italy continued to press her claims to Fiume and strategic points on the eastern shore of the Adriatic. Great Britain and France, though recognizing their obligations under the secret Treaty of London, endeavoured to satisfy Italy with a compromise short of those obligations so as to gain the approval of the American Government. But Wilson persisted in opposition for the sake of the interests of Yugoslavia and Albania. The upshot of the controversy was that Italy secured the island of Sasseno outside the port of Valona, the port remaining in Albanian hands, and at a later date reached an agreement with Yugoslavia. Albania maintained her independence and on Dec. 17, 1920, gained admission to the League of Nations.

The Turkish Settlement.—The Turkish question had been discussed at Paris in May and June 1919 and a Turkish deputation had visited the Conference, but the drafting of the treaty was not taken seriously in hand until the London Conference of Feb. 1920. The delay was due in part to the hope that the United States would join in signing the treaty, but there were also great difficulties involved in the assignment of mandates over the national minorities in the Turkish Empire. Wilson's Twelfth Point had stipulated that these territories should receive "unmolested opportunity of autonomous development." An article in the Treaty of Versailles indicated that some of them at least would be recognized as independent states, under such mandatories as they chose to accept.

But there had been understandings among the Allies that ran counter to the principle of self-determination. In May 1916 France and Great Britain had made the Sykes-Picot agreement with regard to their respective spheres of influence in Turkey. The French sphere was to include Cilicia, southern Armenia and Syria. The British area was to include Haifa and Mesopotamia. Palestine was to be international territory. Greece claimed the whole of Turkish Thrace, the Aegean islands and Smyrna, which Greek forces occupied in May 1919, with the approval of the Supreme Council of the Peace Conference. Italy claimed the Dodecanese, which it had held since the war with Turkey in 1912, and a sphere of influence on the adjacent mainland. Both France and the Hejāz desired the Arab districts of Syria. The disposition of Constantinople also was uncertain.

On Feb. 16, 1920, the London Conference of the Allies announced that Constantinople would remain the capital of Turkey; but a month later the Allies informed Turkey that this concession depended upon its good behaviour. Constantinople had been occupied by Allied troops under the command of Sir G. F. Milne before the end of 1918. On April 25, at the Conference of San Remo, mandates were given to France for Syria, Cilicia and the Lebanon; to Great Britain for Palestine and Mesopotamia, but the mandate over Armenia was declined both by the League of Nations and by the United States. Finally, on May 11, 1920, the draft of a treaty similar in many respects to the Treaty of Versailles was handed to the Turkish representatives at Sèvres. It was signed on Aug. 10, 1920 (*see* SÈVRES, TREATY OF). Thus the task of constructing terms of peace was brought to an end. Real peace, however, had not yet come to the world.

VII. SUMMARY CRITIQUE OF THE CONFERENCE

The Peace Conference should have sat immediately after the conclusion of the Armistice, and should have made a preliminary peace to be followed later by a permanent peace. The belligerent nations had been so shattered by the war that the need for bringing about a resumption of normal conditions as soon as possible was imperative. Much of the distress which has overtaken Europe since 1918 might have been avoided by an early preliminary peace. When the conference first got down to work there was much confusion as to method and also as to the precedence to be given

the subjects to be discussed. There should have been a well-defined programme laid out in advance so as to form a basis for discussion, as was done when the Covenant was formed. The lack of this caused the conference to waste time, and it resulted in the setting up of the ineffective Council of Ten which was, indeed, a council of 30 or 40 when the secretaries, experts and representatives of states interested were included in the meetings. After wasting many weeks in a futile endeavour to get at the facts, the Council of Four was substituted for the Council of Ten. Decisions then came rapidly.

Reparations and Security.—The question of reparations was the most potent cause of delay in negotiations. There was common agreement that Germany should pay to the full extent of her capacity, but there was a wide difference of opinion as to what her capacity was. The heads of the British and French delegations demanded of Germany the entire cost of the war on land and sea. The American Commission deemed this impossible, and sought to have a sum named which Germany might reasonably be expected to pay. After weeks and months of fruitless discussion, President Wilson finally agreed to a compromise which amounted to Germany's signing a blank cheque to be filled in later. He consented to this because it was thought that the Reparations Commission which the treaty provided, would, of necessity, name a sum which could be met. No one then considered the possibility of the United States Senate refusing to ratify the treaty.

The question of French security ran through the discussions at Paris and finally was met by compromise. President Wilson and Lloyd George agreed on behalf of the United States and Great Britain respectively to come to the assistance of France in the event of an unwarranted invasion by Germany. The terms of the treaty were somewhat indefinite, but they were the best that Clemenceau, after long negotiation, was able to secure. Wilson and Lloyd George were adamant in refusing all proposals regarding the left bank of the Rhine as a permanent line.

If the Versailles Treaty had been accepted by the United States, the Franco-American Security Treaty would, in all probability, have gone through; and the Versailles Treaty would have been ratified by the Senate provided President Wilson had been willing to accept the Lodge reservations. The Versailles Treaty failed by six votes of getting the necessary two-thirds; twenty-odd Democrats who were ardently for the treaty voted against it, because of the reservations. As with the League of Nations, the importance of the French Security Treaty was not realized at Paris in the making of the peace. It has been the crux of nearly all the troubles which have beset Europe since the Armistice was signed on Nov. 11, 1918. If the French had been assured of protection, their attitude toward Germany, toward reparations and toward disarmament undoubtedly would have been more in keeping with the public opinion of the world. (*See* SECURITY.)

It is only in retrospect that historic events are seen at their just value. Those who are making history oftentimes exaggerate the importance of some things and underestimate the importance of others. At Paris undue stress was laid on questions of enemy disarmament and reparations—both matters of temporary interest and susceptible of quick solution. Within a few decades they pass from view; but questions like the League of Nations and the security of France reach to the heart of peace and war, and are vital if Western civilization is to live. If it had been seen at Paris, untold hardships might have been averted.

The so-called Secret Treaties were mischievous elements in making decisions, particularly regarding the Italian frontier. Great Britain and France entered the conference with their hands tied by promises made to Italy in order to induce her to enter the war on the side of the Allies. The United States was free to act as seemed best. The fight between Wilson on the one hand and Orlando and Sonnino on the other produced the most acute crisis of the conference. The breaking-point came when Wilson gave out his statement of April 23, 1919. This infuriated the Italians and they left Paris with the threat never to return. Wilson bore the brunt of the criticism which this rift in the conference caused, but he was by no means solely responsible.

Shantung.—At this moment feeling regarding Shantung ran high. No direct threat was made by the Japanese delegates, but it was in the air that if the conference refused their request they too would withdraw. They did not ask to keep Shantung, but merely that it should be returned to China through them. Here again Wilson bore the brunt of the fight, and the taunts of the liberals throughout the world were levelled at him. Even his associate commissioners from the United States, with one exception, protested against his acceding to the Japanese request. However, he and House had personal assurance from Baron Makino and Viscount Chinda that the province would be returned. They were men of the highest character and integrity, and their word, which has since been fully kept, was accepted without question.

The Belgians also were dissatisfied at this period of the conference. Suggestions of withdrawal were made and, with Italy gone, for the moment at least, it would have been fatal to the conference if Japan had left because her pledged word to restore Shantung to China was not accepted. It was a critical period of the conference, and the subsequent action of Japan has shown the wisdom of meeting her request.

Self-Determination.—During the war, when President Wilson announced his theory of self-determination, it stirred the dormant hopes of many peoples and did much to break the discipline in the Central Powers behind the lines. This declaration of war aims brought to Paris many and diverse delegations from Europe, Asia and Africa. They were the most picturesque as well as the most ill-informed and unreasoning of all those who gathered around the historic centre where the peace was made. This noble sentiment, carried to its logical conclusion, would have wrecked the governmental machinery of the world. The conference has received unjustified blame for dividing up the Austrian Empire, but it must be remembered that the empire had already fallen apart before the Peace Conference met. The questions which came before the conference involved the boundaries of states in process of formation, and not the creation of such states. Had the conference undertaken to curb the demand for national independence, its authority to do so would have been denied and another war would have begun.

Mandates.—The acceptance of the principle of mandates was one of the most far-reaching decisions of the conference. It was a new venture in the government of backward peoples, and one destined to play a large part in the affairs of many nations. It gave an excuse and a method for taking over the German colonies by the several countries interested. The German colonial empire vanished overnight. It was one of the hardest blows which her pride received, and one which she resents with passionate fervour.

Until the Paris Conference there had been no attempt to reach a general understanding or fixed policy between the more powerful civilized nations regarding the control or betterment of such states or territories. However, the system hitherto practised was admittedly so bad that when the conference came to the disposition of the late German colonies, there was general agreement that a more enlightened policy should be inaugurated. In furtherance of this desire Article 22 was incorporated in the Covenant of the League of Nations, and subsequently a commission was appointed to sit in London during the summer of 1919 for the purpose of preparing the terms of the mandates. Upon this commission were Lord Milner, who had as his adviser Lord Robert Cecil; M. Simon, French Minister for the Colonies; Viscount Chinda of Japan; Signor Marconi for Italy; and Col. House for the United States, with Mr. George Louis Beer as adviser (*see* MANDATES).

BIBLIOGRAPHY.—The standard history of the Peace Conference is *A History of the Peace Conference in Paris*, 6 vol., ed. H. W. V Temperley (1920–24). It is written chiefly by British experts, many of whom took part in the conference, but its point of view is objective. The texts of the treaties are to be found in the *Treaty Series* of the British Foreign Office, published by H.M. Stationery Office (1920). There is a special volume, *The Treaty of Peace between the Allied and Associated Powers and Germany (with amendments) and other Treaty Engagements Signed at Versailles June 28, 1919, together with the Reply of the Allied and Associated Powers to the Observations of the German Delegation on the Conditions of Peace* (1925). *Comments by the German Delegation on the Conditions of Peace* and the *Reply of the Allied and Associated Powers* are published by the American Association for International Conciliation (1919) and the

covering letter in the *American Journal of International Law* (July 1919). *See* also Deutscher Geschichtskalender, *Vom Waffenstillstand zum Frieden von Versailles*, pp. 565 *seq.* (Leipzig, 1918).

Important confidential documents are contained in R. S. Baker, *Woodrow Wilson and World Settlement* (1922). Important memoirs have been written by participants in the Peace Conference, especially André Tardieu, *The Truth about the Treaty* (1921); B. M. Baruch, *The Making of the Reparation and Economic Sections of the Treaty* (1920); Robert Lansing, *The Peace Negotiations* (1921); *see* also J. M. Keynes, *The Economic Consequences of the Peace* (1920); E M House and C. Seymour, *What Really Happened at Paris* (1921).

VIII. LATER CONFERENCES IN PARIS

After the conclusion of the important conference already described, three meetings of Allied statesmen were held in Paris to consider matters arising out of the execution of the Treaty of Versailles

Jan 24–30, 1921.—A meeting to consider proposals put forward by Allied experts as a result of a meeting between them and German experts at Brussels from Dec 16–22, 1920, in continuation of the Conference of Spa (*see* SPA, CONFERENCE OF). The Allied statesmen adopted the experts' proposal for two German annuities, one fixed and the other on a sliding scale, but they proposed to saddle Germany with a far heavier burden than the experts had considered reasonable The Allied Governments' proposals were rejected by Germany

Aug 8–13, 1921—A meeting of the Supreme Council of the Allied Powers to take action upon the results of the plebiscite in Upper Silesia (*see* SILESIA, UPPER) After failing to agree upon a line of partition between Germany and Poland, the representatives of the principal Allied Powers decided unanimously to refer the question to the Council of the League of Nations, under Article 13 of the Covenant

Jan 2–4, 1923—A meeting between Allied statesmen to consider the terms on which Germany might be granted a reparations moratorium The British Government proposed that Germany should be given an absolute moratorium for four years (except for certain deliveries in kind which were to be credited against future payments), on condition that Germany should stabilize the mark on lines suggested in the majority report of a commission of international experts which the German Government had called in during the preceding autumn; and secondly, that Germany should accept financial control by a foreign finance council, of which the German Minister of Finance was to be chairman, *ex officio*, and which was virtually to supersede the reparations commission. In regard to inter-Allied debts, the British Government made specific proposals which would have given substantial relief to France in exchange for a remission of German indebtedness, which would have been equally substantial

The gulf between these two sets of proposals was so great that there was no chance of an accommodation The conference broke up after the French and British Governments had "agreed to disagree" A week later, on Jan. 11, 1923, the French and Belgian armies invaded the Ruhr (q v ; *see* also REPARATIONS)

PARIS, TREATIES OF. Many treaties and conventions have been signed at Paris, among the more important being the treaty of Feb. 10, 1763, between Great Britain and France at the end of the Seven Years' War; the Treaty of Alliance of Feb. 6, 1778, between France and the United States; the definitive treaty of Sept. 3, 1783, which ended the War of American Independence; and the Treaty of March 30, 1856, between Great Britain, Austria, France, Prussia, Russia, Sardinia and Turkey, which followed the Crimean War When "the treaties of Paris" are referred to without qualification, however, what is commonly meant are the two sets of treaties signed in Paris on May 30, 1814, and Nov 20, 1815. The first embodied the abortive attempt made by the Allies and Louis XVIII. of France to re-establish lasting peace in Europe after the first abdication of Napoleon at Fontainebleau on April 11, 1814. The second contained the penal and cautionary measures which the Allies found it necessary to impose when the practically unopposed return of Napoleon from Elba, and his resumption of power, had proved the weakness of the Bourbon monarchy. It is with these treaties, which are of great importance in the history of Europe and the formation of its public law, that this article is alone concerned.

The treaty of May 30, 1814, and the secret treaty which accompanied it, were signed by Talleyrand for France; by Lords Castlereagh, Aberdeen and Cathcart for Great Britain; by Counts Rasumovski and Nesselrode for Russia, by Prince Metternich and Count Stadion for Austria; and by Baron Hardenberg and W. von Humboldt for Prussia Sweden and Portugal adhered later, and Spain adhered on July 20, to the public treaty, to which there were in all eight signatories. It is this public treaty which is known as the First Treaty of Paris. The Allies declared that their aim was to establish a lasting peace based on a just distribution of forces among the powers, and that as France had returned to "the paternal government of her kings" they no longer thought it necessary to exact those guarantees which they had been regretfully compelled to insist on from her late government. The preamble was more than a flourish of diplomatic humanity, for the treaty was extraordinarily favourable to France It secured her in the possession of all the territory she held in Europe on Jan 1, 1792 (Art II), it restored her colonies, except Tobago, Santa Lucia, Île de France (Mauritius), Rodriguez, and the Seychelles, surrendered to England and the part of San Domingo formerly Spanish, which was to return to Spain (Art. VIII.). Sweden resigned her claim on Guadaloupe (Art IX); Portugal resigned French Guiana (Art X). The rectifications of the European frontier of France are detailed in the eight subsections of Art III They were valuable. France obtained (1) a piece of territory south of Mons, (2 and 3) a larger piece of territory around Philippeville, on the Sambre and Meuse, (4) a rectification including Sarrelouis, (5) a piece of land to connect the formerly isolated fortress of Landau with her own dominions; (6) a better frontier east at Doubes, (7) a better frontier as against Geneva, (8) the sub-prefectures of Annecy and Chambéry (Savoy) By the same article she secured all the German *enclaves* in Alsace, also Avignon, the Venaissin and Montbéliard Art VI. secured Holland to the house of Nassau, with an addition of territory, not defined in this instrument, asserted the independence, and right to federate of the German states, and the full sovereignty of all the states of Italy outside of the Italian dominions of Austria Art. VII gave Malta to Great Britain By Art XV. France was to retain two-thirds of all warships and naval stores existing in ports which had belonged to the empire of Napoleon, but were outside the borders of France, with exception of the Dutch ships By Art XXXII the powers bound themselves to meet at Vienna within two months to arrange a final settlement of Europe Among the additional articles was an agreement with Great Britain by which France undertook to suppress the slave trade

The separate and secret articles of the treaty (or "Secret Treaty" as they are commonly called), were meant to bind France to agree in principle to the readjustments and allotments of territory and population to be made at the Congress of Vienna (*q v*)

The treaties of Nov 20, 1815, and their dependent instruments, were signed in very different circumstances. The representative of France was the duc de Richelieu; Great Britain was represented by Castlereagh and Wellington; Austria by Metternich and Count Wessenberg, Prussia by Hardenberg and W von Humboldt; Russia by Rasumovski and Capo D'Istria The preamble stated the altered spirit and purpose of the Allies It insisted that, as the powers had saved France and Europe from Napoleon's last adventure, they were entitled to compensation and security for the future They had decided to exact indemnities, partly pecuniary and partly territorial, such as could be exacted without injuring the essential interest of France. The territorial penalty imposed was moderate France retained the *enclaves* she had secured by the previous treaty She had to resign her gains on the north and eastern frontier, to surrender Philippeville, Marienbourg, Bouillon, Sarrelouis and Landau, to cede certain territories to Geneva, and she lost Annecy and Chambéry. The standard taken was the frontier of 1790 (Art I). By Art. III. she agreed to dismantle the fortress of Hüningen near Basle. The most grievous articles of the treaty are those which imposed the payment of an indemnity, and the occupation of a part of French terri-

tory as security for payment. Art. IV. fixed the indemnity at 700,000,000 frs. Art. V. fixed the strength of the army of occupation at 150,000 under a commander-in-chief to be later named by the powers, and specified the fortresses it was to hold in the north and north-east of France. The period of occupation was limited to five years, but might be reduced to three. All provisions of the treaty of May 30, 1814, and of the Final Act of the Congress of Vienna not expressly revoked were to remain in force. By an additional article the powers agreed to join Great Britain in suppressing the slave trade. On the day of the signing of the Second Treaty of Paris, a treaty of alliance, commonly spoken of as the treaty of Nov. 20, 1815, was signed in Paris by Great Britain, Austria, Russia and Prussia. It contained six articles. The first declared the determination of the Allies to enforce the treaty signed with France; the second, third and fourth reaffirmed their determination to exclude the Bonaparte family from the throne, and specified the measures they were prepared to take to support one another. The fifth declared that the alliance for the purposes stated would continue when the five years' occupation of France was ended. The sixth article stated that in order to facilitate and assure the execution of the present treaty, the High Contracting Parties had decided to hold periodical meetings of the sovereigns or their ministers, for the examination of such measures as appeared to be salutary for the repose and prosperity of their peoples and the maintenance of the peace of Europe. It was in accordance with this last article that the congresses of Aix-la-Chapelle (1818), Troppau (1820), Laibach (1821), and Verona (1822) were held (*see* EUROPE: *History*).

See texts in Hertslet, *The Map of Europe by Treaty*, I. (1875), and Martens, *Nouveau recueil de traités, etc.*, ii. (Göttingen, 1818); W. Alison Phillips, *The Confederation of Europe* (2nd ed. 1919) and C. K. Webster, *The Foreign Policy of Castlereagh* (1925). (W. A. P.)

PARIS COMMUNE: *see* COMMUNE.

PARISH. In the early Christian Church each district was administered by a bishop and his attendant presbyters and deacons, and the word *parochia* was frequently applied to such a district. Scattered congregations or churches within the *parochia* were served by itinerant presbyters. Towards the close of the 4th century it had become usual for the bishop to appoint resident presbyters to defined districts or territories, to which the term "parish" came gradually to be applied. (*See* also DIOCESE.) Parish, in English ecclesiastical law, may be defined as the township or cluster of townships assigned to the ministration of a single priest, to whom its tithes and other ecclesiastical dues were paid; but the word has now acquired several distinct meanings.

The parish as an institution is later in date than the township, for the latter has been in fact the unit of local administration ever since England was settled in its several States and kingdoms. The beginnings of the parochial system in England are attributed to Theodore of Tarsus, archbishop of Canterbury towards the close of the 7th century. The system was extended in the reign of Edgar, but was not complete until the reign of Edward III.

After the abolition of compulsory church rates in 1868 the old ecclesiastical parish ceased to be of importance as an instrument of local government. Its officers, however, have still important duties to perform. The rector, vicar or incumbent is a corporation-sole, in whom is vested the freehold of the church and churchyard, subject to the parishioners' rights of user; their rights of burial have been enlarged by various Acts. (*See* CHURCHWARDEN.) The other officials are the parish clerk and sexton. They have freeholds in their offices and are paid by customary fees, but can now be dismissed by a joint act of the incumbent and the parochial church council. The office of the clerk is regulated by an Act of 1844, enabling a curate to undertake its duties. The only civil function of the parish clerk remaining in 1894 was the custody of maps and documents, required to be deposited with him under standing orders of parliament before certain public works were begun. By the Local Government Act 1894 they are now deposited with the chairman or clerk of a parish council. Church parochial councils have been created by the Parochial Church Councils (Power) Measure 1921. The primary duty of the new church parochial council is to co-operate with the incumbent. It is a body corporate with perpetual succession. The powers of the vestry and church trustees have been mostly transferred to it, and it has power to levy a voluntary church rate.

Under the powers given by the Church Building Acts, and Acts for making new parishes, many populous parishes have been subdivided into smaller ecclesiastical parishes. This division has not affected the parish in its civil aspect. For purposes of civil government the term "parish" means a district for which a separate poor-rate is or can be made, or for which a separate overseer is or can be appointed; and by the Interpretation Act 1889 this definition is to be used in interpreting all statutes subsequent to 1866, except where the context is inconsistent therewith. The civil importance of the poor-law parishes may be dated from the introduction of the poor law by the statute of 43 Elizabeth, which directed overseers of the poor to be appointed in every parish, and made the churchwardens into *ex officio* overseers. The chief part of the parochial organization was the vestry-meeting. The vestry represented the old assembly of the township, and retained so much of its business as had not been insensibly transferred to the court-baron and court-leet. The freemen, now appearing as the ratepayers, elected the "parish officers," as the churchwardens and way-wardens, the assessors, the overseers, and (if required) paid assistant-overseers, a secretary or vestry-clerk, and a collector of rates if the guardians applied for his appointment. The Local Government Act 1894 restored the parish to its position as the unit of local government by establishing parish councils. (*See* UNITED KINGDOM.)

The Parish in Scotland.—There can be little doubt that about the beginning of the 13th century the whole, or almost the whole, of the kingdom of Scotland was divided into parishes. It seems probable that the bishops presided at the first formation of the parishes—the parish being a subdivision of the diocese—and down to the Reformation they exercised the power of creating new parishes. After the Reformation the power of altering parishes was assumed by the legislature. The existing parochial districts being found unsuited to the ecclesiastical requirements of the time, a general Act was passed in 1581, which made provision for the parochial clergy, and, *inter alia*, directed that "a sufficient and competent" district should be appropriated to each church as a parish (1581, cap. 100). Thereafter, by a series of special Acts in the first place, and, subsequent to the year 1617, by the decrees of parliamentary commissions, the creation of suitable parochial districts was proceeded with. In the year 1707 the powers exercised by the commissioners were permanently transferred to the Court of Session, whose judges were appointed to act in future as "commissioners for the Plantation of Kirks and Valuation of Teinds." Under this statute the areas of parishes continued to be altered and defined down to 1844, when the Act commonly known as Graham's Act was passed. This Act, which applied to the disjunction and erection of parishes, introduced a simpler procedure.

The main division of parishes in Scotland was into civil and ecclesiastical, or, to speak more accurately, into parishes proper (*i.e.*, for all purposes, civil and ecclesiastical) and ecclesiastical parishes. This division is expressed in legal language by the terms, parishes *quoad omnia* (i.e., *quoad civilia et sacra*) and parishes *quoad sacra*—*civilia* being such matters as church rates, education, poor law and sanitary purposes, and *sacra* being such as concern the administration of church ordinances, and fall under the cognizance of the church courts. There are other minor divisions. The Local Government (Scotland) Act 1894 reformed parish government. It established a local government board for Scotland, with a council in every parish, and abolished parochial boards.

The Parish in the United States.—The term "parish" is not in use as a territorial designation except in Louisiana, the 60 parishes of which correspond to the counties of the other States of the Union. In the American Episcopal Church the word is frequently used to denote an ecclesiastical district.

BIBLIOGRAPHY.—The principal records from which information may be gained as to the oldest parochial system in England are the records called *Nomina villarum*, the *Taxatio papae Nicholai* made in 1291, the *Nonarum inquisitiones* relating to assessments made upon the clergy, the *Valor ecclesiasticus* of Henry VIII., the lay subsidies from the reign of Edward III. to that of Charles II., the hearth-tax

assessments and the land-tax accounts. On the subject of the parish generally *see* J. Toulmin Smith, *The Parish* (1854), W. Stubbs, *Constitutional History* (1880); W. C. Glen, *Parish Law* (1881); J. Steer, *Parish Law* (1899), O. Reichel, *Rise of the Parochial System in England* (1905); S and B Webb, *English Local Government*, vol. i. (1906). For fuller information regarding the Scottish parish *see* J. Connell, *Tithes* (1815), *Parishes* (1818, 1820), J M Duncan, *Parochial Ecclesiastical Law* (1864), H Goudy and W. C. Smith, *Local Government in Scotland* (1880), Cobden club essays on *Local Government and Taxation in the United Kingdom* (1882), M. Atkinson, *Local Government in Scotland* (1904).

PARISH CLERK: *see* CLERK and PARISH.

PARISITE, a rare mineral, consisting of cerium, lanthanum, didymium and calcium fluo-carbonate $(CeF)_2Ca(CO_3)_3$ It is found only as crystals, which belong to the hexagonal system and usually have the form of acute double pyramids terminated by the basal planes; parallel to the basal plane there is a perfect cleavage The crystals are hair-brown in colour and are translucent. Light which has traversed a crystal of parisite exhibits a characteristic absorption spectrum. Until recently the only known occurrence of this mineral was in the famous emerald mine at Muzo in Colombia, South America, found by J. J. Paris, who rediscovered the mine. (L. J S.)

PARIS MÉTROPOLITAIN. The main line of the Métropolitain underground railway, crossing Paris practically from the east to the west (Porte de Vincennes to the Porte Maillot) was opened during the Exhibition, on July 19, 1900

Since then, work has not ceased and, at the present time, the system comprises ten lines affording 95 km 654 m. of working double track Further, 18 km are in course of construction and will be ready for use before 1931; finally, the extension to the suburbs of the existing lines and the opening up of new lines in the interior of Paris will comfortably complete the urban system of the Métropolitain railway

Since the Metropolitain has been working, the number of passengers who travel by it has augmented unceasingly The 1900 figure was 17,660,286 which increased to 702,471,969 in 1928, and the progress is continuing

As new lines were operated and rolling stock was renewed, the original trains of 4 carriages affording accommodation for about 200 seats, were replaced on the main lines of the system by 5-carriage trains with over 500 seats and following each other at intervals of between 1 min 35 sec to 3 min at the peak hours

Thus, 1,770 carriages enable the service to give 122,000 places (sitting room) at the peak hours.

The trains composed of three carriages with engines of two motors of 175 h p and two coaches of which one is first class, can reach the speed of 45 km per hr which may be said to correspond with an average commercial speed of 21–23 km per hr., according to the variance of the lines

The average inter-station distance is 493 m, the highest gradients are 40 mm per metre and the lowest are 50 m

The working of the signal system is almost perfect although each particular signal functions from 400 to 500 times a day The system adopted ensures every train being safeguarded by at least two stop signals

Ticket prices in 1900 were ofr 15 (2nd class) ofr 25 (1st class) and ofr 20 for a return. These prices are now increased to · 2nd class, ofr 60; 1st class, 1fr and the return ofr 70; this increase, a coefficient of 3 8, allows profits being realized however, which proves that in spite of the great increase in cost of material, the Métropolitain has been able to direct its system with very efficient managership (P MA)

PARIS UNIVERSITY. This university is also known as the Sorbonne, the name originally given to the college founded by Robert de Sorbon in Paris; hence applied afterwards popularly to the theological faculty, and so to the institution which is now the seat of the *académie* of that city For the early beginnings of the university, *see* UNIVERSITIES The Sorbonne itself was founded in Feb. 1256 (O S) and was originally one of the various colleges which formed part of the university, but it soon became a meeting-place for all the students of the University of Paris, who resorted thither to hear the lectures of the most learned theologians of the period—Guillaume de Saint Amour, Eudes de Douai, Laurent l'Anglais, Pierre d'Ailly. At the close of the century it was organized into a full faculty of theology, and under this definite form it conferred bachelors', licentiates' and doctors' degrees, and the severity of its examinations gave an exceptional value to its diplomas. The so-called "thèse sorbonique," instituted towards the beginning of the 14th century, became the type of its order by the length and difficulty of its tests. Ultimately the professors of the Sorbonne came to be resorted to for dogmatic decisions and judgments in canon law, the clergy of France and of the whole Catholic world had recourse to them in difficult cases, and the Curia Romana more than once laid its doubts before them To the Sorbonne belongs the glory of having introduced printing into France in 1470, within its precincts it assigned quarters for Ulric Gering and two companions in which to set up their presses The Sorbonne took a leading part in the religious discussions which agitated France during the 16th and 17th centuries, and its influence thus inevitably extended to political questions During the insanity of Charles VI it helped to bring about the absolution of Jean Sans-Peur for the assassination of the duke of Orleans Shortly afterwards it demanded and supported the condemnation of Joan of Arc, during the Reformation it was the animating spirit of all the persecutions directed against Protestants and unbelievers The declaration of the clergy in 1682, which it subscribed, ended its authority with the Curia Romana; it revived for a short time under Louis XV during the struggle against Jansenism, but this was its last exploit, it was suppressed like the old universities, in 1792

When the University of France was organized in 1808 (*see* UNIVERSITIES), the Sorbonne became the seat of the *académie* of Paris as well as of the university itself Between 1816 and 1821 the faculties of theology (since disappeared), science and literature were installed there The university library was transferred to the Sorbonne in 1823. In 1868 was organized the Ecole des Hautes Etudes, and in 1897 the Ecole des Chartes also found its home alongside of the Sorbonne, both being independent institutions, as are also the Collège de France, the Ecole Normale Supérieure, and the schools of oriental languages, fine-arts, decorative arts, scientific agriculture and the specialised schools for the training of Colonial administrators, civil engineers, army officers, etc.

In 1852 the Sorbonne was made the property of the city of Paris; a reconstruction of the buildings, projected by Napoleon III, was begun in 1885, under the direction of Nénot This new Sorbonne is one of the finest university edifices in the world In 1896 the higher education of France was decentralized, regional universities were created out of the existing isolated faculties, and the new University of Paris received its present constitution Since then, except for the World War period, it has gone forward under a series of able administrators, Louis Liard, Lucien Poincaré, Appel, Lepic and its present head, Charléty

Benefactions.—The system of benefactions inaugurated by Liard has resulted in the foundation of numerous chairs and institutes. Among the benefactors may be cited the prince of Monaco, the Marquise Arconati Visconti, Albert Kahn, David Weill, the city of Paris, Czechoslovakia Two of the most recent are the Sauberan benefaction of three successive millions of francs, and the gift of Leo Kahn of nearly 700 000 francs for a chair of American civilization

The influx of foreign students has been fostered by the creation of a university quarter A site was provided by mutual concessions of the State and the city of Paris on ground originally occupied by the fortifications, on which accommodation has been created for French students through the princely gift of E Deutsch de la Meurthe of 10 million francs This was followed by a gift by M. and Mme. Lapôtre of five millions for a Belgian hostel Other hostels in being or in course of construction are the Canadian, Argentine, Japanese, United States, British, Swedish Armenian, Indo-china, etc The total number of rooms, when completed, will be nearly 2,000, of which about 600 will be for French, 300 for British and 275 for United States students Ten other countries are contemplating the erection of national hostels A general assembly building with restaurants, library, etc, is being provided mainly by the generosity of J D. Rockefeller,

Jr. The British Institute comprises also a building next the Sorbonne which provides special coaching for English and French students and possesses a fine library of English books.

In 1900 the University of Paris contained 11,000 students, of whom 1,100 were foreigners. In 1928 the number was nearly 27,000 of whom about 6,500 were foreigners; male students numbered nearly 20,000. Of the above nearly 14,000 were enrolled, nearly 8,000 had matriculated, and over 4,500 had taken examinations in the year under review.

See Denifle, *Documents relatifs à la fondation de l'université de Paris* (1883); J. A. Randolph, *History of the Sorbonne; La Cité Universitaire de Paris* (Imprimerie Choix). (C. Br.)

PARK, MUNGO (1771–1806?), Scottish explorer of the Niger, was born in Selkirkshire, Scotland, on Sept. 20, 1771, at Foulshiels on the Yarrow. He was apprenticed to a surgeon, Thomas Anderson, and took his surgeon's diploma at Edinburgh. By his brother-in-law, James Dickson, he was introduced to Sir Joseph Banks, then president of the Royal Society, and through his good offices obtained the post of assistant-surgeon on board the "Worcester" East Indiaman. He made the voyage in 1792 to Benkulen, in Sumatra, and on his return in 1793 he contributed a description of eight new Sumatran fishes to the *Transactions* of the Linnean Society.

Park in 1794 offered his services to the African Association, then looking out for a successor to Major Daniel Houghton, who had been sent out in 1790 to explore the Niger. On June 21, 1795, he reached the Gambia and ascended that river 200m. to a British trading station named Pisania. On Dec. 2, he started for the unknown interior, crossing the upper Senegal basin and the semi-desert region of Kaarta. The journey was full of difficulties, and at Ludamar he was imprisoned by a Moorish chief for four months. He escaped, alone and with nothing save his horse and a pocket compass, on July 1, 1796, and on the 21st of the same month reached the long-sought Niger at Segu. He followed the river down stream 80m. to Silla, where he was obliged to turn back, being without means and utterly exhausted. On his return journey he took a route more to the south keeping close to the Niger as far as Bamako, tracing the course of that stream in all for some 300 miles. He reached Pisania again on June 10, 1797. An account of his journey was drawn up for the African Association by Bryan Edwards, and a detailed narrative from his own pen appeared in 1799 (*Travels in the Interior of Africa*). Abundance of incident and an unaffected style rendered the work extremely popular, and it still holds its place as an acknowledged classic in this department of literature.

Settling at Foulshiels, Park in August 1799 married a daughter of his old master, Thomas Anderson. In Oct. 1801 Park removed to Peebles, where he practised as a doctor. In the autumn of 1803 he was invited by the government to lead another expedition to the Niger. Park accepted the offer, but the starting of the expedition being delayed, part of the waiting time was occupied in the perfecting of his Arabic. In May 1804 Park went back to Foulshiels where he made the acquaintance of Sir Walter Scott, then living near by at Ashestiel. In September he was summoned to London to leave on the new expedition. Park had adopted the theory that the Niger and the Congo were one. He sailed from Portsmouth for the Gambia on January 31, 1805, having been given a captain's commission as head of the government expedition. Alexander Anderson, his brother-in-law, was second in command, and on him was bestowed a lieutenancy. George Scott, a fellow Borderer, was draughtsman, and the party included four or five artificers. At Goree (then in British occupation) Park was joined by Lieut. Martyn, R.A., thirty-five privates and two seamen. The expedition did not reach the Niger until the middle of August, when only eleven Europeans were left alive; the rest had succumbed to fever or dysentery. From Bamako the journey to Segu was made by canoe. Having received permission from the ruler of that town to proceed, at Sansandig, a little below Segu, Park prepared for his journey down the still unknown part of the river. He converted two canoes into one tolerably good boat, 40ft. long and 6ft. broad. This he christened H.M. schooner "Joliba" (the native name for the Niger), and in it, with the surviving members of his party, he set sail down stream on Nov. 19. At Sansandig on Oct. 28, Anderson had died, and in him Park lost the only member of the party—except Scott, already dead—who had been of real use. Those who embarked in the "Joliba" were Park, Martyn, three European soldiers (one mad), a guide and three slaves.

To his wife he wrote stating his intention not to stop nor land anywhere till he reached the coast, where he expected to arrive about the end of Jan. 1806. No more was heard of the party until reports of disaster reached the settlements on the Gambia. At length the British government engaged Isaaco to go to the Niger to ascertain the fate of the explorer. At Sansandig Isaaco found the guide who had gone down stream with Park, and the substantial accuracy of the story he told was later confirmed by the investigations of Hugh Clapperton and Richard Lander. This guide (Amadi) stated that Park's canoe descended the river to Yauri, where he (the guide) landed. In this long journey of about 1,000m. Park, who had plenty of provisions, stuck to his resolution of keeping aloof from the natives. At the Bussa rapids, not far below Yauri, the boat struck on a rock and remained fast. On the bank were gathered hostile natives, who attacked the party with bow and arrow and throwing spears. Their position being untenable, Park, Martyn and the two soldiers who still survived, sprang into the river and were drowned. The sole survivor was one of the slaves, from whom was obtained the story of the final scene. Isaaco, and later Lander, obtained some of Park's effects, but his journal was never recovered. In 1827 his second son, Thomas, landed on the Guinea coast, intending to make his way to Bussa, where he thought his father might be detained a prisoner, but after penetrating some little distance inland he died of fever. Park's widow died in 1840.

J. Thomson's *Mungo Park and the Niger* (London, 1890) contains the best critical estimate of the explorer and his work. *See* also the Life (by Wishaw) prefixed to *Journal of a Mission into the Interior of Africa in 1805* (London, 1815) and H. B., *Life of Mungo Park* (Edinburgh, 1835).

PARKER, ALTON BROOKS (1852–1926), American lawyer, was born at Cortland, N.Y., May 14, 1852. He graduated from the Albany Law School in 1873. Admitted to the bar, he began to practise at Kingston, N.Y., and in 1877 was elected surrogate of Ulster county. In 1885 he was appointed by the governor justice of the N.Y. supreme court to fill a vacancy, and the following year was regularly elected. He was appointed a member of the second division of the N.Y. court of appeals in 1889 and a member of the general term in 1893. In 1898 he was elected chief justice of the N.Y. court of appeals. In 1904 he resigned on being nominated by the Democrats for President, but he was defeated by Theodore Roosevelt. He then resumed the practice of law in New York city. In 1913 he was counsel for the managers of the impeachment of Governor Sulzer of New York. He died in New York city, May 10, 1926.

PARKER, SIR GILBERT (1862–), British novelist and politician, was born at Camden East, Addington, Ontario, on Nov. 23, 1862, the son of Captain J. Parker, R.A. He was educated at Ottawa and at Trinity university, Toronto. In 1886 he went to Australia, and became for a while associate-editor of the *Sydney Morning Herald*. He also travelled extensively in the Pacific and in northern Canada; and in the early '90s he made his name in London as a writer of romantic fiction. The best of his novels are those in which he first took for his subject the history and life of the French Canadians; and his permanent literary reputation rests on the fine quality, descriptive and dramatic, of his Canadian stories. *Pierre and his People* (1892) was followed by *Mrs. Falchion* (1893), *The Trail of the Sword* (1894), *When Valmond came to Pontiac* (1895), *An Adventurer of the North* (1895), and *The Seats of the Mighty* (1896, dramatized in 1897). *The Lane that had no Turning* (1900) contains some of his best work. In *The Battle of the Strong* (1898) he broke new ground, laying his scene in the Channel islands. Among his many later books is *Carnac's Folly* (1922). M.P. for Gravesend 1900 to 1918, he was a notable champion of imperialism. In 1902 he was made a knight, in 1915 a baronet, and in 1916 a privy councillor.

PARKER, HENRY TAYLOR (1867–), American music and dramatic critic, was born at Boston (Mass.) on April 29, 1867. Educated at Harvard, 1886–89, and in Europe, 1889–91, he was the New York correspondent of the Boston *Transcript* 1892–98 and again 1901–03, with the intermediate years as its London correspondent, when he made a special study of European theatres and opera houses. He was dramatic critic of the New York *Globe* to 1905, adding music criticism later, then rejoined the Boston *Transcript*. He published *Eighth Notes*, 1921.

PARKER, HORATIO WILLIAM (1863–1919), American composer and musician, was born at Auburndale, Mass., Sept. 15, 1863. He studied music first in Boston, later at the Royal Conservatoire, Munich. In 1894 he was appointed professor of the theory of music at Yale. His oratorio *Hora Novissima* was widely performed in America. It was also given in England in 1899 at Chester and at the "Three Choirs" festival at Worcester, the latter an honour never before paid an American composer. His opera *Mona* won the Metropolitan Opera Company's $10,000 prize in 1911, and in 1914 his opera *Fairyland* gained the National Federation of Women's Clubs' $10,000 prize. For the centenary celebration of the Handel and Haydn Society of Boston in 1915 he wrote the cantata *Morven and the Grail*.

His other works include the cantatas, *King Trojan* and *The Kobolds*, and the oratorios, *St. Christopher* and *A Wanderer's Psalm*. He died at Cedarhurst, Long Island, Dec. 18, 1919.

PARKER, SIR HYDE, Bart. (1739–1807), British admiral, second son of Sir Hyde Parker (1714–82), entered the navy at an early age, and became lieutenant in 1758. Five years later he became a post-captain, and from 1766 served in the West Indies and in North American waters, particularly distinguishing himself in breaking the defences of the North river (New York) in 1776. His services on this occasion earned him a knighthood in 1779. In 1778 he was engaged in the Savannah expedition, and in the following year his ship was wrecked on the hostile Cuban coast. His men, however, entrenched themselves, and were in the end brought off safely. Parker was with his father at the Dogger Bank, and with Howe in the two actions in the Straits of Gibraltar. In 1793, having just become rear-admiral, he served under Lord Hood at Toulon and in Corsica, and two years later, now a vice-admiral, he took part, under Hotham, in the indecisive fleet actions of March 13, and July 13, 1795. From 1796 to 1800 he was in command at Jamaica. In 1801 he was appointed to command the fleet destined to break up the northern armed neutrality, with Nelson as his second-in-command. Copenhagen fell on April 2 to the fierce attack of Nelson's squadron, Parker with the heavier ships taking little part. Subsequently Parker hesitated to advance up the Baltic after his victory, a decision which was severely criticised. Soon afterwards he was recalled and Nelson succeeded him. He died in 1807.

PARKER, JOSEPH (1830–1902), English Nonconformist divine, was born at Hexham-on-Tyne on April 9, 1830, his father being a stonemason. He managed to pick up a fair education, which in after-life he constantly supplemented. In the revolutionary years from 1845 to 1850 young Parker as a local preacher and temperance orator gained a reputation for vigorous utterance. He was influenced by Thomas Cooper, the Chartist, and Edward Miall, the Liberationist, and was much associated with Joseph Cowen, afterwards M.P. for Newcastle. In the spring of 1852 he wrote to Dr. John Campbell, minister of Whitefield Tabernacle, Moorfields, London, for advice as to entering the Congregational ministry, and after a short probation he became Campbell's assistant. He also attended lectures in logic and philosophy at University College, London. From 1853 to 1858 he was pastor at Banbury. His next charge was at Cavendish Street, Manchester, where he rapidly made himself felt as a power in English Nonconformity. While here he published a volume of lectures entitled *Church Questions*, and, anonymously, *Ecce Deus* (1868), a work provoked by Seeley's *Ecce Homo*. In 1869 he returned to London as minister of the Poultry church, founded by Thomas Goodwin. He then began the scheme which resulted in the erection of the great City Temple in Holborn Viaduct. It cost £70,000, and was opened on May 19, 1874. His original sermons, with their notable leaning towards the use of a racy vernacular, made him one of the best known personalities of his time. Dr. Parker was twice chairman of the London Congregational Board and twice of the Congregational Union of England and Wales. The death of his second wife in 1899 was a blow from which he never fully recovered, and he died on Nov. 29, 1902.

Parker's published works are mainly sermons and expositions, chief among them being *City Temple Sermons* (1869–70) and *The People's Bible*, in 25 vols. (1885–95). Other volumes include the autobiographical *Springdale Abbey* (1869), *The Inner Life of Christ* (1881), *Apostolic Life* (1884), *Tyne Chylde: My Life and Teaching* (1883; new ed., 1889), *A Preacher's Life* (1899).

See E. C. Pike, *Dr. Parker and his Friends* (1905); *Congregational Year-Book* (1904).

PARKER, MARTIN (*c.* 1600–*c.* 1656), English ballad writer, was probably a London tavern-keeper. About 1625 he seems to have begun publishing ballads, a large number of which bearing his signature or his initials, "M.P.," are preserved in the British Museum. Dryden considered him the best ballad writer of his time. Sympathy with the fortunes of Charles I. inspired the best known of his ballads, "When the King enjoys his own again" (1643), a favourite Jacobite song in the 18th century.

See *The Roxburghe Ballads*, vol. iii. (Ballad Soc., 9 vols., 1871–1899); Joseph Ritson, *Bibliographia Poetica* (1802); *Ancient Songs and Ballads from Henry II. to the Revolution*, ed. by W. C. Hazlitt (1877); Sir S. E. Brydges and J. Haslewood, *The British Bibliographer*, vol. ii. (1810); Thomas Corser, *Collectanea Anglo-poetica* (1860–83).

PARKER, MATTHEW (1504–1575), archbishop of Canterbury, was born at Norwich, on Aug. 6, 1504. Matthew was sent in 1522 to Corpus Christi college, Cambridge. He graduated B.A. in 1525, was ordained deacon in April and priest in June 1527, and was elected fellow of Corpus in the following September. He commenced M.A. in 1528, and was one of the Cambridge scholars whom Wolsey wished to transplant to his newly founded Cardinal College at Oxford. Parker, like Cranmer, declined the invitation. He had come under the influence of the Cambridge reformers, and after Anne Boleyn's recognition as queen he was made her chaplain. Through her he was appointed dean of the college of secular canons at Stoke-by-Clare in 1535. In 1537 he was appointed chaplain to Henry VIII., and in 1538 he was threatened with prosecution by the reactionary party. But in 1541 he was appointed to the second prebend in the reconstituted cathedral church of Ely. In 1544 on Henry VIII.'s recommendation he was elected master of Corpus Christi College, and in 1545 vice-chancellor of the university. He got into some trouble with the chancellor, Gardiner, over a ribald play, "Pammachius," performed by the students, deriding the old ecclesiastical system, though Bonner wrote to Parker of the assured affection he bore him. On the passing of the act of parliament in 1545, enabling the king to dissolve chantries and colleges, Parker was appointed one of the commissioners for Cambridge, and their report saved its colleges, if there had ever been any intention to destroy them. Stoke, however, was dissolved in the following reign, and Parker received a pension equivalent to £400 a year in modern currency. He took advantage of the new reign to marry in June, 1547, before clerical marriages had been legalized by parliament and convocation, Margaret, daughter of Robert Harlestone, a Norfolk squire. During Kett's rebellion he was allowed to preach in the rebels' camp on Mousehold Hill, but without much effect; and later he encouraged his chaplain, Alexander Neville, to write his history of the rising. His Protestantism advanced with the times, and he received higher promotion under Northumberland than under the moderate Somerset. Bucer was his friend at Cambridge, and he preached Bucer's funeral sermon in 1551. In 1552 he was promoted to the rich deanery of Lincoln, and in July 1553 he supped with Northumberland at Cambridge, when the duke marched north on his campaign against Mary.

As a supporter of Northumberland and a married man, Parker was naturally deprived of his preferments. But he was not cast in a heroic mould, and he had no desire to figure at the stake; he lived quietly in retirement throughout Mary's reign. He was elected archbishop of Canterbury on Aug. 1, 1559; but it was not until Dec. 17 that four bishops were found willing and qualified to

consecrate him. Parker's consecration was, however, only made legally valid by the royal supremacy; for the Edwardine Ordinal, which was used, had been repealed by Mary and not re-enacted by the parliament of 1559. Parker was a modest and moderate man of genuine piety and irreproachable morals. His historical research was exemplified in his *De antiquitate ecclesiae,* and his editions of Asser, Matthew Paris, Walsingham and the compiler known as Matthew of Westminster; his liturgical skill was shown in his version of the psalter and in the occasional prayers and thanksgivings which he was called upon to compose; and he left a priceless collection of manuscripts to his college at Cambridge.

He was happier in these pursuits than in the exercise of his jurisdiction. He was left to stem the rising tide of Puritan feeling with little support from parliament, convocation or the crown. The bishops' *Interpretations* and *Further Considerations,* issued in 1560, tolerated a lower vestiarian standard than was prescribed by the rubric of 1559; the *Advertisements,* which Parker published in 1566, to check the Puritan descent, had to appear without specific royal sanction; and the *Reformatio legum ecclesiasticarum,* which Foxe published with Parker's approval, received neither royal, parliamentary nor synodical authorization. Parker died on May 17, 1575, lamenting that Puritan ideas of "governance" would "undo the queen and all others that depended upon her."

John Strype's *Life of Parker,* originally published in 1711, and re-edited for the Clarendon Press in 1821 (3 vols.), is the principal source for Parker's life. *See* also J. Bass Mullinger's scholarly life in *Dict. Nat. Biog.;* W. H. Frere's volume in Stephens and Hunt's *Church History;* Strype's *Works* (General Index); Gough's Index to *Parker Soc. Publ.* Fuller, Burnet, Collier and R. W. Dixon's Histories of the Church; Birt's *Elizabethan Settlement;* H. Gee, *Elizabethan Clergy* (1898); W. M. Kennedy, *Archbishop Parker* (1908).

PARKER, THEODORE (1810–1860), American preacher and social reformer, was born at Lexington, Mass., on Aug. 24, 1810, the grandson of Capt. John Parker, leader of the minutemen in the skirmish at Lexington. From his mother he learned the religion of love and good works; from his father the use of good books; and his formal training he secured in the district school and one term at Lexington academy. At 17 he became a schoolmaster, and in his 20th year he entered himself at Harvard, working on his father's farm as usual while he followed his studies, and going over to Cambridge for the examinations only. For the theological course he resided at the college, graduating in 1836. At the close of his college career he began his translation (published in 1843) of Wilhelm M. L. De Wette's *Beiträge zur Einleitung in das Alte Testament.* He found himself extremely antagonistic to the popular theology of the period. He was ordained in West Roxbury, however, in 1837, and preached there until 1846. His rationalistic views were slow in assuming form; but on May 19, 1841, he preached at Boston a sermon on "the transient and permanent in Christianity," which presented in embryo the main principles and ideas of his final theological position. The Boston Unitarian clergy denounced him, and declared that the "young man must be silenced." Nevertheless, he delivered in the Masonic hall, in the winter of 1841–42, the lectures published as the *Discourse of Matters pertaining to Religion* (1842). Beginning in 1845 he preached to the Twenty-Eighth Congregational society of Boston. He took up the question of the emancipation of the slaves, and fearlessly advocated in Boston and elsewhere, from the platform and through correspondence and the press, the cause of the negroes. He assisted actively in the escape of fugitive slaves, and aided John Brown (*q.v.*). But his days were numbered. In Jan. 1859 he suffered a violent haemorrhage of the lungs, and vainly sought relief by retreating first to the West Indies and then to Europe. He died in Florence on May 10, 1860. A preacher rather than a thinker, a reformer rather than a philosopher, he spoke straight to men's intelligence and conscience and the goodness of their hearts.

Among his principal works are: *Ten Sermons of Religion* (1852) and *Theism, Atheism and the Popular Theology* (1853). A collected edition of his works was published in England by Frances P. Cobbe (1863–70), and another—the Centenary edition—in Boston, Mass., by the American Unitarian Association (1907–11); a volume of *Theodore Parker's Prayers,* edited by Rufus Leighton and Matilda Goddard, was published in 1861, and a volume of Parker's *West Roxbury Sermons,* with a biographical sketch by F. B. Sanborn, in 1892. A German translation of part of his works was made by Ziethen (Leipzig, 1854–57).

BIBLIOGRAPHY.—The best biographies are John Weiss's *Life and Correspondence of Theodore Parker* (1864); O. B. Frothingham's *Theodore Parker: A Biography* (Boston, 1874); and J. W. Chadwick's *Theodore Parker, Preacher and Reformer* (Boston, 1900), the last containing a good bibliography. *See* also G. W. Cooke, ed., *Theodore Parker, The American Scholar* (Boston, 1907); E. D. Meade, *Emerson and Theodore Parker* (Boston, 1910); and "The Parker Library," Boston Pub. Library *Bull.,* ser. 4, vol. v., p. 361–67 (Boston, 1923).

PARKER OF WADDINGTON, ROBERT JOHN PARKER, BARON (1857–1918), English judge, was born at Claxby, Lincs., on Feb. 25, 1857, and educated at Westminster, Eton and King's College, Cambridge. In 1883 he was called to the bar, and built up an important connection, largely dealing with Government work. He was raised to the Bench in 1906. In 1913 he was made a lord of appeal with a life peerage. From 1916 until shortly before his death Lord Parker presided over the Prize Court branch of the Privy Council Judicial Committee. He died at Haslemere on July 12, 1918.

PARKERSBURG, a city of West Virginia, U.S.A., the county seat of Wood county; on the Ohio river, at the mouth of the Little Kanawha, about midway between Wheeling and Huntington. It is on Federal highways 21 and 50, and is served by the Baltimore and Ohio and the Little Kanawha railways and river steamers. Pop. 20,050 in 1920 (94% native white); estimated locally at 28,000 in 1928. It is pleasantly situated among low hills, at an altitude of about 600 feet. Oil, coal, natural gas and fireclay abound in the vicinity. Parkersburg has a large trade in petroleum and ship timber, and its manufactures (valued in 1925 at $19,565,391) include petroleum products, lumber, glass, steel, shovels and electrical porcelain. The city was founded in 1789 and incorporated in 1820.

PARKES, SIR HARRY SMITH (1828–1885), English diplomatist, son of Harry Parkes, founder of the firm of Parkes, Otway and Company, ironmasters, was born at Birchills Hall, near Walsall in Staffordshire, in 1828, and was educated at King Edward's school, Birmingham. In 1842 he received an appointment in the consular service, and accompanied Sir Henry Pottinger to Peking, and witnessed the signing of the treaty on board the "Cornwallis" in August 1842. By this treaty the five ports of Canton, Amoy, Fuchow, Ningpo and Shanghai were opened to trade. After short residences at Canton and the newly opened Amoy, Parkes was appointed to the consulate at Fuchow. Here he served under Rutherford Alcock. In 1849 he returned to England, returning to China in 1851. After a short stay at Amoy as interpreter he was transferred in the same capacity to Canton. In May 1854 he was promoted to be consul at Amoy, and in 1855 was chosen as secretary to the mission to Bangkok, being employed in negotiating the first European treaty with Siam.

In June 1856 he returned to Canton as acting consul, a position which brought him into contact with the obstinate Commissioner Yeh. When, in Oct. 1856, as a climax to many outrages, Yeh seized the British lorcha "Arrow" and made prisoners of her crew, Parkes at once closed with his enemy. In response to a strongly worded despatch from Parkes, Bowring, governor of Hong-Kong, placed matters in the hands of Admiral Sir M. Seymour, who took Canton at the close of the same month but had not a sufficient force to hold it. In December 1857 Canton was again bombarded by Seymour. Parkes, who was attached to the admiral's staff, was the first man to enter the city, and Parkes virtually governed this city of a million inhabitants for three years.

Meanwhile the treacherous attack at Taku upon Sir Frederick Bruce led to a renewal of hostilities in the north, and Parkes was ordered up to serve as interpreter and adviser to Lord Elgin (July, 1860). While arranging for a meeting between Lord Loch and the Chinese peace commissioners he, Mr. (afterwards Lord) Loch, Mr. de Norman, Lord Elgin's secretary of legation, Mr. Bowlby, the *Times* correspondent, and others, were

treacherously taken prisoners (Sept. 18, 1860) and incarcerated for some days. In revenge Lord Elgin burned down the Summer Palace of the emperor. Towards the end of 1860 Parkes returned to his post at Canton. On the restoration (Oct. 1861) of the city to the Chinese he returned to England on leave, and received the K.C.B.

On his return to China he served for a short time as consul at Shanghai, and was then appointed minister in Japan (1865). For eighteen years he held this post, using his influence in support of the Liberal party of Japan. So earnestly did he throw in his lot with these reformers that he became a marked man, and incurred the bitter hostility of the reactionaries, who on three separate occasions attempted to assassinate him. In 1882 he was transferred to Peking. He died on March 21, 1885.

The standard *Life* is by Stanley Lane-Poole (1894). (R. K. D.)

PARKES, SIR HENRY (1815–1896), Australian statesman, was born at Stoneleigh, in Warwickshire, on May 27, 1815. The son of parents in very humble circumstances, he received only a rudimentary education, and at an early age was obliged to earn his living as a common labourer. Failing to make his way in England, he emigrated to Australia in 1839, and after a time settled in Sydney as an ivory-turner. He took a prominent part in the movement against the transportation of convicts, and in 1849 started the *Empire* newspaper to inculcate his policy of attacking abuses while remaining loyal to the Crown. The paper appeared until 1858. One of the reforms for which Parkes fought most strenuously was the full introduction of responsible government. He was returned to the legislative council under the old constitution as member for Sydney, and on the establishment of a legislative assembly in 1856 was elected for East Sydney. He was elected for East Sydney again in 1859 at the first general election under the new electoral act, and sat till 1861, when he was sent to England to promote emigration.

He made a prolonged stay in England, and described his impressions in a series of letters to the *Sydney Morning Herald*, some of which were reprinted in 1869 under the title of *Australian Views of England*. He returned to Australia in 1863, and became colonial secretary from 1866 to 1868. He passed the Public Schools Act of 1866, which for the first time instituted an efficient system of primary education in the colony. His great chance came in 1872, when the Martin ministry resigned on the question of the sum payable by Victoria in lieu of border duties. Parkes had for several years persistently advocated free imports as a remedy for the financial distress of the colony. He now became prime minister and colonial secretary; and he threw the colony open to trade. He held office till 1875, and on the fall of the Robertson ministry again became premier and colonial secretary from March till Aug. 1877. At the end of this year he was made K.C.M.G. He formed a coalition with Sir John Robertson, and became premier and colonial secretary for the third time from Dec. 1878 to Jan. 1883. In 1887 he again took office as prime minister. His free trade policy was once more successful. Other important measures of his administration were the reform of the civil service, the prohibition of Chinese immigration, and the railways and public works acts. He fell from office in Jan. 1889, but in the following March became for the fifth time premier and colonial secretary. The remainder of his life was chiefly devoted to the question of Australian federation. The Federal Convention at Melbourne in 1890 was mainly his work; and he presided over the convention at Sydney in 1891, and was chiefly responsible for the draft constitution there carried. Defeated in Oct. 1891 on his refusal to accept an eight hours' day for coal-miners, he remained in opposition for the rest of his career. He died at Sydney on April 27, 1896. Parkes may justly be called the Father of the Australian Commonwealth.

He published, in addition to the works already named and numerous volumes of verse, a collection of speeches on the *Federal Government of Australia* (1890), and an autobiography, *Fifty Years in the making of Australian History* (1892). *See* also *Life of Sir H. Parkes*, C. E. Lyne (1897).

PARKMAN, FRANCIS (1823–1893), American historian, was born in Boston on Sept. 16, 1823. He was the son of Francis Parkman, a graduate of Harvard in 1807.

Francis Parkman was the eldest of six children. As a boy his health was delicate, so that it was thought best for him to spend much of his time at his grandfather Hall's home in Medford on the border of the Middlesex Fells, a rough and rocky woodland, which was as wild in many places as the primaeval forest. This breezy life saved him from the artificial stupidity which is too often superinduced in boys by their school training. At the age of 14 Parkman began to show a strong taste for literary composition. In 1841, while a student at Harvard, he made a rough journey of exploration in the woods of northern New Hampshire, and at this time he determined to write a history of the last French war in America, which ended in the conquest of Canada, and some time afterwards he enlarged the plan so as to include the whole course of the American conflict between France and Great Britain; or, to use his own words, "The history of the American forest; for this was the light in which I regarded it. My theme fascinated me, and I was haunted with wilderness images day and night." In the course of 1842 illness led to his making a journey to Italy. In 1844 he graduated at Harvard with high honours.

He now determined to study the real wilderness in its gloom and vastness. He had become an adept in woodcraft and a dead shot with the rifle, and could do such things with horses, tame or wild, as civilized people never see done except in a circus. In company with his friend and classmate, Quincy Shaw, he passed several months with the Ogillalah band of Sioux. Knowledge, intrepidity and tact carried Parkman through these experiences unscathed, and good luck kept him clear of encounters with hostile Indians. It was a very important experience in relation to his life-work.

But outdoor life did not suffice to recruit Parkman's health, and by 1848, when he began writing *The Conspiracy of Pontiac*, he had reached a truly pitiable condition. The trouble seems to have been some form of nervous exhaustion, accompanied with such hypersensitiveness of the eyes that it was impossible to keep them open except in a dark room. Against these difficulties he struggled with characteristic obstinacy. He invented a machine which so supported his hand that he could write legibly with closed eyes. Books and documents were read aloud to him, while notes were made by him with eyes shut, and were afterwards deciphered and read aloud to him till he had mastered them. After half an hour his strength would give out, and in these circumstances his rate of composition for a long time averaged scarcely six lines a day. The superb historical monograph composed under such difficulties was published in 1851. It had but a small sale, as the American public was then too ignorant to feel much interest in American history. But Parkman began his great work on *France and England in the New World*, to which the book just mentioned was in reality the sequel. This work involved several journeys to Europe, and was performed with a thoroughness approaching finality.

In 1865 the first volume appeared, with the title of *Pioneers of France in the New World;* 27 years elapsed before the final volumes came out in 1892. After the *Pioneers* the sequence is *The Jesuits in North America, La Salle and the Discovery of the Great West, the Old Régime in Canada, Frontenac and New France and Louis XIV., Montcalm and Wolfe, A Half Century of Conflict.* As one obstacle after another was surmounted, as one grand division of the work after another became an accomplished fact, the effect upon Parkman's condition seems to have been bracing, and he acquired fresh impetus as he approached the goal. His physical condition was much improved by his cultivating plants. He was an adept horticulturist and himself originated several new varieties of flowers. He was professor of horticulture in the agricultural school of Harvard in 1871–72, and published a few books on the subject of gardening. He died at Jamaica Plain Nov. 8, 1893.

The significance of Parkman's work consists partly in the success with which he has depicted the North American Indians. Parkman was the first great writer who really understood the Indian's character and motives. Against this savage background of the forest he shows the rise, progress and dramatic termination of the colossal struggle between France and Great Britain for

colonial empire. With all its instructiveness, his book is a narrative as entertaining as those of Macaulay or Froude. In judicial impartiality Parkman may be compared with Gardiner, and for accuracy of learning with Stubbs. (J. F.)

PARLAKIMEDI, a town of British India, in Ganjam district of Madras. Pop. (1921) 18,719. It is the residence of a raja, claiming descent from the ancient kings of Orissa. The town is on a light railway connecting with Naupada.

PARLEMENT, in O.Fr. the name given to any meeting for discussion or debate (*parler*, to speak), a sense in which it was still used by Joinville, but from the latter half of the 13th century employed in France in a special sense to designate the sessions of the royal court (*curia regis*). Finally, when the parlement of Paris had become a permanent court of justice, having the supreme authority in cases brought before it, and especially in appeals against the sentences of the *baillis* and seneschals, it retained this name, which was also given to the other supreme courts of the same nature which were created after its model in the provinces.

Early Usage.—The early Capetians had a custom, based upon ancient precedents, of summoning periodically to their court their principal vassals and the prelates of their kingdom. These gatherings took place on the occasion of one of the great festivals of the year, in the town in which the king was then in residence. Here they deliberated upon political matters and the vassals and prelates gave the king their advice. But the monarch also gave judgment here in those cases which were brought before him. These were few in number during the early days of the Capetian dynasty; for though the king always maintained the principle that he was judge, and even that his competence in this respect was general and unlimited, this competence was at the same time undefined and it was not compulsory to submit cases to the king. At this period, too, appeals, strictly so called, did not exist. Nevertheless when a suit was brought before the king he judged it with the assistance of his prelates and vassals assembled around him, who formed his council. This was the *curia regis*. But in law the king was sole judge, the vassals and prelates being only advisers. During the 12th and at the beginning of the 13th centuries the *curia regis* continued to discharge these functions, except that its importance and actual competence continued to increase, and that we frequently find in it, in addition to the vassals and prelates who formed the council, *consiliarii*, who are evidently men whom the king had in his entourage, as his ordinary and professional councillors. Under the reign of St. Louis (which was also the period at which the name parlement began to be applied to these judicial sessions) the aspect of affairs changed. The judicial competence of the parlement developed and became more clearly defined; the system of appeals came into existence, and appeals against the judgments of the *baillis* and seneschals were brought before it; cases concerning the royal towns, the *bonnes villes*, were also decided by it. Again, in the old registers of the parlement at this period, the first *Olim* books, we see the names of the same councillors recurring from session to session. This suggests that a sufficient number of councillors was assured beforehand, and a list drawn up for each session; the vassals and prelates still figuring as a complementary body at the council.

Reforms.—Next came the series of ordinances regulating the tenure of the parlement, those of 1278, 1291, 1296 and 1308, and the institution was regularized. Not only were the persons who were to constitute each parlement named in advance, but those who were not placed on this list, even though vassals or prelates, were excluded from judging cases. The royal *baillis* had to attend the parlement, in order to answer for their judgments, and at an early date was fixed the order of the different *bailliages*, in which the cases coming from them were heard. The *baillis*, when not interested in the case, formed part of the council, but were afterwards excluded from it. Before the middle of the 14th century the personnel of the parlement, both presidents and councillors, became fixed *de facto* if not *de iure*. Every year a list was drawn up of those who were to hold the session, and although this list was annual, it contains the same names year after year; they are as yet, however, only annual commissaries (*commissaires*). In 1344 they became officials (*officiers*) fixed but not yet irremovable. At the same time the parlement had become permanent; the number of the sessions had diminished, but their length had increased. In the course of the 14th century it became the rule for the parlement to sit from Martinmas (Nov. 11) till the end of May; later the session was prolonged till the middle of August, the rest of the year forming the vacation. The parlement had also become fixed at Paris, and, by a development which goes back to fairly early times, the presidents and councillors, instead of being merely the king's advisers, had acquired certain powers, though these were conferred by the monarch; they were, in fact, true magistrates. The king held his court in person less and less often, and it pronounced its decrees in his absence; we even find him pleading his cause before it as plaintiff or defendant. In the 14th century, however, we still find the parlement referring delicate affairs to the king; but in the 15th century it had acquired a jurisdiction independent in principle. As to its composition, it continued to preserve one notable feature which recalled its origin. It had originally been an assembly of lay vassals and prelates; when its composition became fixed and consisted of councillor-magistrates, a certain number of these offices were necessarily occupied by laymen, and others by ecclesiastics, the *conseillers lais* and the *conseillers clercs*.

The parlement was at the same time the court of peers (*cour des pairs*). This had as its origin the old principle according to which every vassal had the right to be tried by his peers, *i.e.*, by the vassals holding fiefs from the same lord, who sat in judgment with that lord as their president. This, it is well known, resulted in the formation of the ancient college of the peers of France, which consisted of six laymen and six ecclesiastics. But although in strict logic the feudal causes concerning them should have been judged by them alone, they could not maintain this right in the *curia regis*; the other persons sitting in it could also take part in judging causes which concerned the peers. Finally the peers of France, the number of whom was increased in course of time by fresh royal creations of peerages, became *ex officio* members of the parlement; they were the hereditary councillors, taking the oath as official magistrates, and, if they wished, sitting and having a deliberative function in the parlement. In suits brought against them personally or involving the rights of their peerage they had the right of being judged by the parlement, the other peers being present, or having been duly summoned.

Divisions.—While maintaining its unity, the parlement had been subdivided into several *chambres* or sections. In the first place there was the *Grand Chambre*, which represented the primitive parlement. To it was reserved the judgment in certain important cases, and in it a peculiar procedure was followed, known as *oral*, though it admitted certain written documents. Even after the offices of the parlement had become legally saleable the councillors could only pass from the other chambers into the *grand chambre* by order of seniority. The *chambres des enquêtes* and *des requêtes* originated at the time when it became customary to draw up lists for each session of the parlement. The *enquêteurs* or *auditeurs* of the parlement had at first been an auxiliary staff of clerks to whom were entrusted the inquests ordered by the parlement. But later, when the institution of the appeal was fully developed, and the procedure before the various jurisdictions became a highly technical matter, above all when it admitted written evidence, the documents connected with other inquests also came before the parlement. A new form of appeal grew up side by side with the older form, which had been mainly an oral procedure, namely the appeal by writing (*appel par écrit*). In order to judge these new appeals the parlement had above all to study written documents, the inquests which had been made and written down under the jurisdiction of the court of first instance. The duty of the *enquêteurs* was to make an abstract of the written documents and report on them. Later the reporters (*rapporteurs*) were

admitted to judge these questions together with a certain number of members of the parlement, and from 1316 onwards these two kinds of members formed together a *chambre des enquêtes*. As yet, no doubt, the *rapporteur* only gave his opinion on the case which he had prepared, but after 1336 all those who formed part of the chamber were put on the same footing, taking it in turn to report and giving judgment as a whole. For a long time, however, the *grand chambre* received all cases, then sent them to the *chambre des enquêtes* with directions; before it too were argued questions arising out of the inquiry made by the *chambre des enquêtes* to the decisions of which it gave effect and which it had the power to revise. But one by one it lost all these rights, and in the 16th century they are no longer heard of. Several *chambres des enquêtes* were created after the first one, and it was they who had the greater part of the work.

The *chambre des requêtes* was of an entirely different nature. At the beginning of the 14th century a certain number of those who were to hold the session of the parlement were set apart to receive and judge the petitions (*requêtes*) on judicial questions which had been presented to the king and not yet dealt with. This eventually led to the formation of a chamber, in the strict sense of the word, the *requêtes du palais*. But this became purely a jurisdiction for privileged persons; before it (or before the *requêtes de l'hôtel*, as the case might be) were brought the civil suits of those who enjoyed the right of *committimus*. The *chambre des requêtes* had not supreme jurisdiction, but appeals from its decisions could be made to the parlement proper The parlement had also a criminal chamber, that of *La Tournelle*, which was not legally created until the 16th century, but was active long before then. It had no definite membership, but the *conseillers lais* served in it in turn.

Provincial Parlements.—Originally there was only one parlement, that of Paris, as was indeed logical, considering that the parlement was simply a continuation of the *curia regis*, which, like the king, could only be one. But the exigencies of the administration of justice led to the successive creation of a certain number of provincial parlements. Their creation, moreover, was generally dictated by political circumstances, after the incorporation of a province in the domain of the Crown. Sometimes it was a question of a province which, before its annexation, possessed a superior and sovereign jurisdiction of its own, and to which it was desired to preserve this advantage. Or else it might be a province forming part of feudal France, which before the annexation had had a superior jurisdiction from which the Crown had endeavoured to institute an appeal to the parlement of Paris, but for which after the annexation it was no longer necessary to maintain this appeal, so that the province might now be given a supreme court, a parlement. Sometimes an intermediate régime was set up between the annexation of the province and the creation of its provincial parlement, under which delegates from the parlement of Paris went and held assizes there. Thus were created successively the parlements of Toulouse, Grenoble, Bordeaux, Dijon, Rouen, Aix, Rennes, Pau, Metz, Douai, Besançon and Nancy. From 1762 to 1771 there was even a parlement for the principality of Dombes. The provincial parlements reproduced on a smaller scale the organization of that of Paris; but they did not combine the functions of a court of peers. They each claimed to possess equal powers within their own province. There were also great judicial bodies exercising the same functions as the parlements, though without bearing the name, such as the *Conseil souverain* of Alsace at Colmar, the *Conseil supérieur* of Roussillon at Perpignan; the provincial council of Artois had not the supreme jurisdiction in all respects.

The parlements, besides their judicial functions, also possessed political rights; they claimed a share in the higher policy of the realm, and the position of guardians of its fundamental laws. In general the laws did not come into effect within their province until they had been registered by the parlements. This was the method of promulgation admitted by the ancient law of France, but the parlements verified the laws before registering them, *i.e.*, they examined them to see whether they were in conformity with the principles of law and justice, and with the interests of the king and his subjects; if they considered that this was not the case they refused their registration and addressed remonstrances (*remontrances*) to the king. In acting thus they were merely conforming to the duty of counselling (*devoir de conseil*) which all the superior authorities had towards the king, and the text of the ordinances (*ordonnances*) had often invited them to do so. It was natural, however, that in the end the royal will should seek to impose itself. In order to enforce the registration of edicts the king would send *lettres de cachet*, known as *lettres de jussion*, which were not, however, always obeyed. Or he could come in person to hold the parlement, and have the law registered in his presence in a *lit de justice*. This was explained in theory by the principle that if the king himself held his court, it lost, by the fact of his presence, all the authority which he had delegated to it; for the moment the only authority existing in it was that of the king, just as in the ancient *curia regis* there was the principle that *apparente rege cessat magistratus*. But, principally in the 18th century, the parlements maintained that only a voluntary registration, by the consent of the parlement, was valid. The parlements had also a wide power of administration. They could make regulations (*pouvoir réglementaire*) having the force of law within their province, upon all points not settled by law, when the matter with which they dealt fell within their judicial competence, and for this it was only necessary that their interference in the matter was not forbidden by law. These were what were called *arrête de règlement*. By this means the parlements took part in the administration, except in matters the cognizance of which was attributed to another supreme court as that of taxation was to the *cours des aides*. They could also, within the same limits, address injunctions (*injonctions*) to officials and individuals.

Langlois, *Textes relatifs à l'histoire du parlement depuis les origines jusqu'en 1314* (1888); Guilhiermoz, *Enquêtes et procès* (1892); Glasson, *Le Parlement de Paris, son rôle politique depuis le règne de Charles VII. jusqu'à la révolution* (2 vols., 1901). (J. P. E.)

PARLIAMENT, the name given to the supreme legislature of the United Kingdom of Great Britain and Ireland. (For the old French *parlement*, *see* PARLEMENT; and for analogous foreign assemblies *see* the articles on the respective countries.) The word is found in English from the 13th century, first for a debate, then for a formal conference, and for the great councils of the Plantagenet kings; and the modern sense has come to be applied retrospectively. William the Conqueror is said in the Chronicle to have had "very deep speech with his Witan"; this "deep speech" (in Latin *colloquium*, in French *parlement*) was the distinguishing feature of a meeting between king and people, and thus gave its name to the national assembly itself. The Statute of Westminster (1275) first uses "parlement" of the great council in England.

The British parliament consists of the king (or queen regnant), the Lords spiritual and temporal, and the Commons; and it meets in two houses, the House of Lords (the Upper or Second chamber) and the House of Commons.

The Crown, pre-eminent in rank and dignity, is the legal source of parliamentary authority. The sovereign virtually appoints the lords spiritual, and all the peerages of the lords temporal have been created by the Crown. The king summons parliament to meet, and prescribes the time and place of its meeting, prorogues and dissolves it, and commands the issue of writs for the election of members of the House of Commons. By several statutes, beginning with the 4 Edward III. c. 14, the annual meeting of parliament had been ordained; but these statutes, continually disregarded, were virtually repealed in the reigns of Charles II. and William and Mary (16 Ch. II. 31; 6 and 7 Will. and Mary, 32). The present statute law merely exacts the meeting of parliament once in three years; but the annual voting of supplies has long since superseded obsolete statutes. When parliament is assembled it cannot proceed to business until the king has declared the causes of summons, in person or by commission; and though the veto of the Crown on legislation has long been obsolete, bills passed by the two houses only become law on receiving the royal assent.

The House of Lords is distinguished by peculiar dignities, priv-

ileges and jurisdictions. Peers individually enjoy the rank and precedence of their several dignities, and are hereditary councillors of the Crown. Collectively with the lords spiritual they form a permanent council of the Crown; and, when assembled in parliament, they form the highest court of judicature in the realm, and were, until the Parliament Act of 1911, a co-equal branch of the legislature, without whose consent no laws could be made. Their judicature is of various kinds, viz., for the trial of peers; for determining claims of peerage and offices of honour, under references from the Crown; for the trial of controverted elections of Scotch and Irish peers; for the final determination of appeals from courts in England and Scotland; and lastly, for the trial of impeachments.

The House of Commons also has its own peculiar privileges and jurisdictions. Above all, it has the paramount right of originating the imposition of all taxes, and the granting of supplies for the service of the State. It has also enjoyed, from early times, the right of determining all matters concerning the election of its own members, and their right to sit and vote in parliament. This right, however, has been greatly abridged, as, in 1868, the trial of controverted elections was transferred to the courts of law; but its jurisdiction in matters of election, not otherwise provided for by statute, is still retained intact. As part of this jurisdiction the house directs the Speaker to issue warrants to the clerk of the Crown to make out new writs for the election of members to fill up such vacancies as occur during the sitting of parliament.

Privileges of Parliament.—Both houses are in the enjoyment of certain privileges, designed to maintain their authority, independence and dignity. These privileges are founded mainly upon the law and custom of parliament, while some have been confirmed, and others abridged or abrogated by statute. The Lords rely entirely upon their inherent right, as having "a place and voice in parliament"; but, by a custom dating from the 6th Henry VIII., the Commons lay claim, by humble petition to the Crown at the commencement of every parliament, "to their ancient and undoubted rights and privileges." Each house has its separate rights and jurisdictions; but privileges properly so-called, being founded upon the law and custom of parliament, are common to both houses. Each house adjudges whether any breach of privilege has been committed, and punishes offenders by censure or commitment. This right of commitment is incontestably established, and it extends to the protection of officers of the house, lawfully and properly executing its orders, who are also empowered to call in the assistance of the civil power. The causes of such commitments cannot be enquired into by courts of law, unless it be manifest that the cause of commitment is other than for contempt (Lord Ellenborough in *Burdett* v. *Abbott,* 1811, 14 East at p. 150), nor can prisoners be admitted to bail. Breaches of privilege may be summarized as disobedience to any orders or rules of the house, indignities offered to its character or proceedings, assaults, insults or libels upon members, or interference with officers of the house in discharge of their duty, or tampering with witnesses. Such offences are dealt with as contempts, according to the circumstances of the respective cases, of which numerous precedents are to be found in the journals of both houses. The Lords may imprison for a fixed period, and impose fines; the Commons can only imprison generally, the commitment being concluded by the prorogation, and have long discontinued the imposition of fines.

Freedom of speech has been one of the most cherished privileges of parliament from early times. Constantly asserted, and often violated, it was finally declared by the Bill of Rights "that the freedom of speech, and debates and proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament." Such a privilege is essential to the independence of parliament, and to the protection of members in discharge of their duties. But, while it protects members from molestation elsewhere, it leaves them open to censure or other punishment by the house itself, whenever they abuse their privilege and transgress the rules of orderly debate.

Freedom from arrest is a privilege of the highest antiquity. It was formerly of extended scope, but has been reduced, by later legislation, within very narrow limits. Formerly not only the persons of members but their goods were protected, and their privilege extended to their servants. At present members are themselves free from arrest, but otherwise they are liable to all the processes of the courts. If arrested, they will be immediately discharged, upon motion in the court whence the process issued. Peers and peeresses are, by the privilege of peerage, free from arrest at all times. Members of the House of Commons are free only for 40 days after prorogation and 40 days before the next appointed meeting; but prorogations are so arranged as to ensure a continuance of the privilege. Formerly, even suits against members were stayed, but this offensive privilege has been abolished by statute. Exemption from attending as witnesses upon subpoena, once an acknowledged privilege, is no longer insisted upon; but immunity from service upon juries is at once an ancient privilege and a statutory right. The privilege of freedom from arrest is limited to civil causes, and has not been suffered to exempt members from the operation of the criminal law, nor even from commitments for contempt by other courts. But, whenever the freedom of a member is so interfered with, the courts are required immediately to inform the house of the causes of his commitment. Witnesses, suitors, counsel and agents in attendance upon parliament are protected from arrest and molestation, and from the consequences of statements made by them, or other proceedings in the conduct of their cases.

As both houses, in enforcing their privileges, are obliged to commit offenders or otherwise interfere with the liberty of the subject, the exercise of these privileges has naturally been called in question before the courts. Each house is the sole judge of its own privileges; but the courts are bound to administer the law, and, where law and privilege have seemed to be at variance, a conflict of jurisdiction has arisen between parliament and the courts. Many interesting controversies have arisen upon such occasions; but of late years privilege has been carefully restrained within the proper limits of the law, and the courts have amply recognized the authority of parliament.

Parliamentary Procedure.—On the day appointed by royal proclamation for the meeting of a new parliament both houses assemble in their respective chambers, when the Lords Commissioners for opening the parliament summons the Commons to the bar of the House of Lords, by the mouth of Black Rod, to hear the commission read. The lord chancellor states that, when the members of both houses shall be sworn, the king will declare the causes of his calling this parliament; and, it being necessary that a Speaker of the House of Commons shall be first chosen, the Commons are directed to proceed to the appointment of a Speaker, and to present him, on the following day, for His Majesty's royal approbation. The Commons at once withdraw to their own house and proceed to the election of their Speaker. The next day the Speaker-elect proceeds, with the house, to the House of Lords, and, on receiving the royal approbation, lays claim, in the accustomed form, on behalf of the Commons, "to their ancient and undoubted rights and privileges." The Speaker, now fully confirmed, returns to the House of Commons, and, after repeating his acknowledgments, reminds the house that the first thing to be done is to take and subscribe the oath required by law. Having first taken the oath himself, he is followed by other members, who come to the table to be sworn. The swearing of members in both houses proceeds from day to day, until the greater number have taken the oath, or affirmation, when the causes of summons are declared by His Majesty in person, or by commission, in "the king's speech." This speech being considered in both houses, an Address (*q.v.*) in answer is agreed to, which is presented to His Majesty by the whole house, or by "the lords with white staves" in one house and privy councillors in the other.

The debate on the Address being over, the real business of the session now commences: the committees of supply and ways and means are set up; bills are introduced; motions are made; committees are appointed; and both houses are, at once, in full activity. The lord chancellor presides over the deliberations of the Lords, and the Speaker over those of the Commons.

Members claim to be heard in debate by rising in their places. When more than one member rises at the same time, in the Lords the member who is to speak is called by the house, in the Com-

mons by the Speaker. Every member, when called, is bound to speak to the question before the house; and calls to order are very frequent. A member may speak once only to any question, except to explain, or upon a point of order, or to reply when a member has himself submitted a motion to the house, or when an amendment has been moved which constitutes a new question. He may not refer to past debates, nor to debates in the other house; nor may he refer to any other member by name, or use offensive and disorderly language against the king, either House of parliament, or other members. Members offending against any of the rules of debate are called to order by the Speaker, or the attention of the chair is directed to the breach of order by another member.

At the conclusion of a debate, unless the motion be withdrawn, or the question (on being put from the chair) be agreed to or negatived, the house proceeds to a division, which effects the twofold purpose of ascertaining the numbers supporting and opposing the question, and of recording the names of members voting on either side. On each side of the house is a division lobby; and in the Lords the "contents" and in the Commons the "ayes" are directed to go to the right, and the "not contents" or "noes" to the left. In case of an equality of numbers, in the Lords the question is negatived in virtue of the ancient rule "semper praesumitur pro negante"; in the Commons the Speaker gives the casting vote. (*See* also PARLIAMENTARY PROCEDURE; SPEAKER.)

Committees.—For the sake of convenience in the transaction of business there are several kinds of committees. Of these the most important is a committee of the whole house. In this committee are discussed the several provisions of bills, resolutions and other matters requiring the consideration of details. In the Lords the chair is taken by the chairman of committees; and in the Commons by the chairman of the committee of ways and means.

In the House of Commons there are now six grand committees. They were founded upon the valuable principle of a distribution of labours among several bodies of members.

In select committees both houses find the means of delegating inquiries, and the consideration of other matters, which could not be undertaken by the whole house. The reports of such committees have formed the groundwork of many important measures; and bills are often referred to them which receive a fuller examination than could be expected in a committee of the whole house. Power is given to such committees, when required, to send for persons, papers and records. In the Lords the power of examining witnesses upon oath has always been exercised, but it was not until 1871 that the same power was extended to the Commons, by statute.

Communications Between the Two Houses, etc.—In the course of the proceedings of parliament, frequent communications between the two houses become necessary. Of these the most usual and convenient form is that of a message. Formerly the Lords sent a message by two judges or two masters in chancery, and the Commons by a deputation of their own members; but since 1855 messages have been taken from one house to the other by one of the clerks at the table. A more formal communication is effected by a conference, in reference to amendments to bills or other matters; but this proceeding has been in great measure superseded by the more simple form of a message. The two houses are also occasionally brought into communication by means of joint committees and of select committees communicating with each other.

Communications, in various forms, are also conducted between the Crown and both houses of parliament. Of these the most important are those in which the king, in person or by commission, is present in the House of Lords to open or prorogue parliament, or to give the royal assent to bills. His Majesty is then in direct communication with the three estates of the realm, assembled in the same chamber. The king also sends messages to both houses under the royal sign manual, when all the members are uncovered. Verbal messages are also sent, and the king's pleasure, or royal recommendation or consent to bills or other matters, signified through a minister of the Crown or a privy councillor. Messages under the sign manual are acknowledged by addresses, except where grants of money are proposed, in which case no address is presented by the Commons, who acknowledge them by making provision accordingly.

Both houses approach the Crown, sometimes by joint addresses, but usually by separate addresses from each house. Such addresses are presented to His Majesty, either by the whole house, or by the lords with white staves in one house and by privy councillors in the other. His Majesty answers, in person, addresses presented by the whole house; but, when presented otherwise, an answer is brought by one of the lords with white staves, or by one of the privy councillors, by whom the address has been presented. Resolutions of either house are also sometimes directed to be laid before His Majesty; and messages of congratulation or condolence are sent to other members of the royal family.

The Passing of Public Bills.—The passing of bills forms the most considerable part of the business of parliament; for an account of the methods of procedure reference should be made to the article PARLIAMENTARY PROCEDURE. But the privileges of the Commons, in regard to supply and taxation, require that all bills imposing a charge upon the people should originate in that house. On the other hand, the Lords claim that bills for restoration of honours or in blood, or relating to their own privileges and jurisdiction, should commence in their house. An act of grace, or general pardon, originates with the Crown, and is read once only in both houses.

Both houses are approached by the people by means of petitions, of which prodigious numbers are presented to the House of Commons every session. They are referred to the committee on public petitions, under whose directions they are classified, analysed, and the number of signatures counted; and, when necessary, the petitions are printed *in extenso*.

Other Functions.—The exclusive right of the Commons to grant supplies, and to originate all measures of taxation, imposes a very onerous service upon that house. This is mainly performed by two committees of the whole house—the committee of supply, and the committee of ways and means. The former deals with all the estimates for the public service presented to the house by command of His Majesty; and the latter votes out of the Consolidated Fund such sums as are necessary to meet the supplies already granted, and originates all taxes for the service of the year. It is here that the annual financial statement of the chancellor of the exchequer, commonly known as "the Budget," is delivered. The resolutions of these committees are reported to the house, and, when agreed to, form the foundation of bills, to be passed by both houses, and submitted for the royal assent; and towards the close of the session an Appropriation Act is passed, applying all the grants for the service of the year.

Whenever a vacancy occurs during the continuance of a parliament, a warrant for a new writ is issued by the Speaker, by order of the house during the session, and in pursuance of statutes during the recess. The causes of vacancies are the death of a member, his being called to the House of Peers, his acceptance of an office from the Crown, his bankruptcy, or a resolution for his expulsion, a matter which is absolutely within the jurisdiction of the House. When any doubt arises as to the issue of a writ, it is usual to appoint a committee to inquire into the circumstances of the case; and during the recess the Speaker may reserve doubtful cases for the determination of the house.

Controverted elections had been originally tried by select committees, afterwards by the committee of privileges and elections, and ultimately by the whole house, with scandalous partiality, but under the Grenville Act of 1770, and other later Acts, by select committees, so constituted as to form a more or less judicial tribunal. At length, in 1868, the trial of election petitions was transferred to judges of the superior courts, to whose determination the house gives effect, by the issue of new writs or otherwise. The house, however, still retains and exercises its jurisdiction in all cases not relegated, by statute, to the judges.

Other forms of parliamentary judicature still remain to be mentioned. Upon impeachments by the Commons, the Lords exercise the highest criminal judicature known to the law; but the occasions upon which it has been brought into action have

been very rare in modern times. Another judicature is that of the trial of peers by the House of Lords. And, lastly, by a bill of attainder, the entire parliament may be called to sit in judgment upon offenders.

One other important function of parliament remains to be noticed—that of private bill legislation. Here the duties of parliament are partly legislative and partly judicial. Public interests are promoted, and private rights secured. This whole jurisdiction has been regulated by special standing orders, and by elaborate arrangements for the nomination of capable and impartial committees. A prodigious legislative work has been accomplished—but under conditions most costly to the promoters and opponents of private bills, and involving a serious addition to the onerous labours of members of parliament.

HISTORY OF THE BRITISH PARLIAMENT

The shire-moot was also the general folk-moot of the tribe, assembled in arms, to whom their leaders referred the decision of questions of peace and war.

The origin of parliament may be sought in the assemblies of the Anglo-Saxons known as the "folk-moot" or tribal assembly and in the "shire-moot" or assembly of the freemen of the shire. Superior to these local institutions was the witenagemót, or assembly of wise men, with whom the king took counsel in legislation and the government of the State This national council has sometimes been regarded as the origin of parliament but to describe it as such is an unhistorical anticipation of modern usage. Its character has been the subject of much antiquarian investigation, notably by Stubbs and Liebermann It must never be forgotten that in these early times, and indeed long after, the making of new laws is as abhorrent as it is rare The cry of the nation, so often expressed in the charters, is not for making of of new law but for the preservation of old ones, while the levying of taxes is almost unknown except for purposes of national defence. Such a council was originally held in each of the kingdoms commonly known as the Heptarchy; and after their union in a single realm, under King Edgar, the witenagemót became the national assembly. The witenagemót concluded treaties, advised the king as to the disposal of public lands and the appointment and removal of officers of State, and even assumed to elect and depose the king himself. The king had now attained to greater power, and more royal dignities and prerogatives. He was unquestionably the chief power in the witenagemót; but the laws were already promulgated, as in later times, as having been agreed to with the advice and consent of the witan. The witan also exercised jurisdiction as a supreme court. These ancient customs present further examples of the continuity of English constitutional forms.

The constitution of the witenagemót, however, was necessarily less popular than that of the local moots in the hundred or the shire. The king himself was generally present; and at his summons came prelates, abbots, ealdormen, the king's gesiths and thegns, officers of State and of the royal household, and leading tenants in chief of lands held from the Crown Crowds sometimes attended the meetings of the witan, and shouted their acclamations of approval or dissent; and, so far, the popular voice was associated with its deliberations; but it was at a distance from all but the inhabitants of the place in which it was assembled, and until a system of representation (*q v*) had slowly grown up there could be no further admission of the people to its deliberations.

The Norman Conquest.—The Anglo-Saxon polity was suddenly overthrown by the Norman Conquest A stern foreign king had seized the crown, and was prepared to rule his conquered realm by the sword. He brought with him the absolutist principles of Continental rulers, and the advanced feudal system of France and Normandy. Feudalism had been slowly gaining ground under the Saxon kings, and now it was firmly established as a military organization. William the Conqueror at once rewarded his warlike barons and followers with enormous grants of land. The Saxon landowners and peasants were despoiled, and the invaders settled in their homesteads. The king claimed the broad lands of England as his own, by right of conquest; and when he allowed his warriors to share the spoil he attached the strict condition of military service in return for every grant of land. An effective army of occupation of all ranks was thus quartered upon every province throughout the realm. England was held by the sword; a foreign king, foreign nobles, and a foreign soldiery were in possession of the soil, and swore fealty to their master, from whom they held it. Saxon bishops were deposed, and foreign prelates appointed to rule over the English Church. Instead of calling a national witenagemót, the king took counsel with the officers of his State and household, the bishops, abbots, earls, barons and knights by whom he was pleased to surround himself. Some of the forms of a national council were indeed maintained but the witenagemót was now transformed into a "common council" of tenants-in-chief. It was thus a purely feudal assembly.

In spite of the immense constitutional prestige enjoyed by Magna Carta, that historical document played little or no part in the development of parliament. It was there ordained that no scutage or aid, except the three regular feudal aids, should be imposed, save by the common council of the realm. To this council the archbishops, bishops, abbots, earls and greater barons were to be summoned personally by the king's letters, and the lesser tenants in chief by a general writ through the sheriff. The summons was required to appoint a certain place, to give 40 days' notice at least, and to state the cause of meeting.

This council was in no sense a modern parliament nor was it intended to be. Magna Carta has been truly described as "a very feudal document," how feudal McKechnie has forcibly shown in his standard commentary. By these clauses the tenants-in-chief protected themselves from arbitrary taxation by the Crown without their "common counsel," but they did not thereby preclude themselves from taxing their own mesne tenants. It is only when later kings begin, of their own initiative, to summon representatives of the shires and boroughs to attend meetings of the common council to grant a tax that the "Commons" come into existence. And there can be no doubt that Maitland is right when he traces the origin of the "Commons," and the principle of representation which their summons implied, to the adaptation of the pre-existing institution of the jury to that purpose. Originating as a fiscal instrument for valuation of land, as in Domesday Book, or for assessment to the first tax on personalty, as in the case of the Saladin tithe, the jury was extended to the "presentment" of crimes by Henry II. and, as such, it represented the township, the borough and the "hundred" in the "county court." It was originally elected and from this it was but a step to summoning elected representatives of the counties and boroughs to Westminster

But it must be remembered that the idea that the consent of the local communities or "communes" of county and borough to taxation is necessary is of very late growth. The juries of neighbours who were summoned to assess the people under the Saladin tithe were assessing a tax to which their consent was neither asked nor required. A definite departure was made when, in 1265, Simon de Montfort, the leader of the revolt against Henry III, summoned to Lewes a national assembly which was distinctive in that writs were issued not only to the knights of the shire, who had occasionally been summoned before, but to representatives of the boroughs. It was a revolutionary assembly but none the less it established a precedent.

The transition period between Simon de Montfort's parliament of 1265 and the "model parliament" of 1295 was long a puzzle to historical students, since, except for two provincial councils in 1283, no traces were found in the records, between 1265 and 1295, of the representation of cities or boroughs, or of representation of the counties between 1275 and 1290. But in 1910 C. Hilary Jenkinson (see *English Historical Review*, for April) found in the Record Office some old documents which proved to be fragments of three writs and of returns of members for the Easter parliament of 1275. They make it certain that knights of the shire were then present, and that burgesses and citizens were summoned (not as in 1265 through the mayors, but as since 1295 through the sheriffs). The importance of the 1295 parlia-

ment thus appears to be smaller in English constitutional history, the full reforms appearing to have been adopted 20 years earlier. It is noteworthy, however, that in the writs of 1275 the instruction to the sheriff is "venire facias," not "elegi facias."

In 1295 these precedents were followed with a parliament summoned by Edward I. which was long regarded as the first "model parliament." But as an institution it had yet to make its footing good as the exclusive authority on taxation. In legislation it was long subject to competition by the king's council and by the "Great Council." (*See* Privy Council.) The "Great Council" continued to be summoned not infrequently without the issue of writs to the Commons, and this is the test applied in peerage cases to determine whether the descendant of a baron summoned to a national assembly has made out his claim to be a "lord of parliament." (*See* the *St. John Barony* case, 1915, A.C. 305, where it was held that a national assembly of 1290 was not a parliament, in spite of its having passed the "Statute" of *Quia Emptores,* because the Commons were not summoned.)

Secession of the Clergy.—It formed part of Edward's policy to include the clergy in his scheme for the representation of all orders and classes of his subjects. They were summoned to attend the parliament of 1295 and succeeding parliaments of his reign, and their form of summons has been continued until the present time; but the clergy resolutely held aloof from the national council, and insisted upon voting their subsidies in their own convocations of Canterbury and York. The bishops retained their high place among the earls and barons, but the clergy sacrificed to ecclesiastical jealousies the privilege of sharing in the political councils of the State. As yet, indeed, this privilege seemed little more than the voting of subsidies, but it was soon to embrace the redress of grievances and the framing of laws for the general welfare of the realm. By the 17th century the clergy definitely lost their power of separate taxation and were included in the grant made by the Commons (1664).

Meanwhile the Commons, unconscious of their future power, took their humble place in the great council of the realm. The knights of the shire, as lesser barons, or landowners of good social standing, could sit beside the magnates of the land without constraint; but modest traders from the towns were overawed by the power and dignity of their new associates. They knew that they were summoned for no other purpose than the taxing of themselves and their fellow townsmen; their attendance was irksome; it interrupted their own business; and their journeys exposed them to many hardships and dangers. It is not surprising that they should have shrunk from the exercise of so doubtful a privilege. Considerable numbers absented themselves from a thankless service; and their constituents, far from exacting the attendance of their members, as in modern times, begrudged the sorry stipend of 2s. a day, paid to their representatives while on duty, and strove to evade the burden imposed upon them by the Crown. Some even purchased charters, withdrawing franchises which they had not yet learned to value. Nor, in truth, did the representation of towns at this period afford much protection to the rights and interests of the people. Towns were enfranchised at the will or caprice of the Crown and the sheriffs; they could be excluded at pleasure; and the least show of independence would be followed by the omission of another writ of summons. But the principle of representation (*q.v.*), once established, was to be developed with the expansion of society; and the despised burgesses of Edward I., not having seceded, like the clergy, were destined to become a potential class in the parliaments of England. Eventually, in 1624, the principle that once a writ had been issued to a borough to send representatives to parliament, and obeyed, it could no longer be withheld was established and thereby the independence of the Commons was secured. The Crown, however, retained the prerogative to incorporate new boroughs with parliamentary representation and thus, in days when there was no such thing, except in the case of the counties, as a common franchise, the Crown could by the charter of incorporation create what franchise for the borough it pleased. The Tudors made free use of this prerogative to "pack" the Commons, but in the reign of Charles II. it fell wholly into desuetude.

Another constitutional change during the reign of Edward I. was the summoning of parliament to Westminster instead of to various towns in different parts of the country. This custom invested parliament with the character of a settled institution, and constituted it a high court for the hearing of petitions and the redress of grievances. The growth of its judicature, as a court of appeal, was also favoured by the fixity of its place of meeting.

Authority of Parliament Recognized by Law.—Great was the power of the Crown, and the king himself was bold and statesmanlike; but the union of classes against him proved too strong for prerogative. In 1297, having outraged the church, the barons, and the Commons, by illegal exactions, he was forced to confirm the Great Charter and the Charter of Forests, with further securities against the taxation of the people without their consent and, in return, obtained timely subsidies from the parliament. Henceforth the financial necessities of a succession of kings ensured the frequent assembling of parliaments. Nor were they long contented with the humble function of voting subsidies, but boldly insisted on the redress of grievances and further securities for national liberties. In 1322 it was declared by statute 15 Edw. II. that "the matters to be established for the estate of the king and of his heirs, and for the estate of the realm and of the people, should be treated, accorded, and established in parliament, by the king, and by the assent of the prelates, earls and barons, and the commonalty of the realm, according as had been before accustomed." The constitutional powers of parliament as a legislature were here amply recognized —not by royal charter, or by the occasional exercise of prerogative, but by an authoritative statute. And these powers were soon to be exercised in a striking form. Already parliament had established the principle that the redress of grievances should have precedence of the grant of subsidies; it had maintained the right of approving councillors of the Crown, and punishing them for the abuse of their powers; and in 1327 the king himself was finally deposed, and the succession of his son, Edward III., declared by parliament.

At this period the constitution of parliament was also settling down to its later and permanent shape. Hitherto the different orders or estates had deliberated separately, and agreed upon their several grants to the Crown. The knights of the shire were naturally drawn, by social ties and class interests, into alliance with the barons; but at length they joined the citizens and burgesses, and in the first parliament of Edward III. they are found sitting together as "the Commons." This may be taken as the turning point in the political history of England. If all the landowners of the country had become united as an order of nobles, they might have proved too strong for the development of national liberties, while the union of the country gentlemen with the burgesses formed an estate of the realm which was destined to prevail over all other powers. The withdrawal of the clergy, who would probably have been led by the bishops to take part with themselves and the barons, further strengthened the united Commons.

The reign of Edward III. witnessed further advances in the authority of parliament, and changes in its constitution. The king, being in continual need of subsidies, was forced to summon parliament every year, and in order to encourage its liberality he frequently sought its advice upon the most important issues of peace or war, and readily entertained the petitions of the Commons praying for the redress of grievances. During this reign also, the advice and consent of the Commons, as well as of the Lords spiritual and temporal, was regularly recorded in the enacting part of every statute.

Separation of the Two Houses.—But a more important event is to be assigned to this reign,—the formal separation of parliament into the two houses of Lords and Commons. There is no evidence—nor is it probable—that the different estates ever voted together as a single assembly. It appears from the rolls of parliament that in the early part of this reign, the causes of summons having been declared to the assembled estates, the three estates deliberated separately, but afterwards delivered a

collective answer to the king. While their deliberations were short they could be conducted apart, in the same chamber; but, in course of time, it was found convenient for the Commons to have a chamber of their own, and they adjourned their sittings to the chapter-house of the abbot of Westminster, where they continued to be held after the more formal and permanent separation had taken place. The date of this event is generally assigned to the 17th Edward III.

Parliament had now assumed its present outward form. But it was far from enjoying the authority which it acquired in later times. The Crown was still paramount; the small body of earls and barons—not exceeding 40—were connected with the royal family, or in the service of the king, or under his influence; the prelates, once distinguished by their independence, were now seekers of royal favour; and the Commons, though often able to extort concessions in return for their contributions to the royal exchequer, as yet held an inferior position among the estates of the realm. Instead of enjoying an equal share in the framing of laws, they appeared before the king in the humble guise of petitioners. Their petitions, together with the king's answers, were recorded in the rolls of parliament, but it was not until the parliament had been discharged from attendance that statutes were framed by the judges and entered on the statute rolls Under such conditions legislation was, in truth, the prerogative of the Crown rather than of parliament. Enactments were often found in the statutes at variance with the petitions and royal answers, and neither prayed for by the Commons nor assented to by the Lords. In vain the Commons protested against so grave an abuse of royal authority; but the same practice was continued during this and succeeding reigns Henry V, in the second year of his reign, promised "that nothing should be enacted to the petitions of the Commons, contrary to their asking, whereby they should be bound without their assent"; but, so long as the old method of framing laws was adhered to, there could be no security against abuse; and it was not until the reign of Henry VI. that the introduction of the more regular system of legislating by bill and statute ensured the thorough agreement of all the estates in the several provisions of every statute.

The Commons, however, notwithstanding these and other discouragements, were constantly growing bolder in the assertion of their rights. In 1377 the demands of a former parliament were reiterated with greater boldness and persistence, the evil councillors of the late reign were driven out, and it was conceded that the principal officers of State should be appointed and removed, during the minority of Richard II, upon the advice of the lords. The Commons also insisted upon the annual assembling of parliament, under the stringent provisions of a binding law. They claimed the right, not only of voting subsidies, but of appropriating them, and of examining public accounts. They inquired into public abuses, and impeached ministers of the Crown Even the king himself was deposed by the parliament Thus during this reign all the great powers of parliament were asserted and exercised. The foreign wars of Henry IV. and Henry V., by continuing the financial necessities of the Crown, maintained for a while the powers which parliament had acquired.

Relapse of Parliamentary Influence.—But a period of civil wars and disputed successions was now at hand, which checked the further development of parliamentary liberties. With the close of the Wars of the Roses the life of parliament seems to have well-nigh expired.

To this constitutional relapse various causes contributed at the same period. The Crown had recovered its absolute supremacy. The powerful baronage had been decimated on the battlefield and the scaffold; and vast estates had been confiscated to the Crown. The Commons had lost the liberal franchises of an early age. All freeholders, or suitors present at the county court, were formerly entitled to vote for a knight of the shire; but in the eighth year of Henry VI. (1430) an Act was passed (c. 37) by which this right was confined to 40s. freeholders, resident in the county. Large numbers of electors were thus disfranchised.

As for the cities and boroughs, they had virtually renounced their electoral privileges. As we have seen, they had never valued them very highly; and now by royal charters, or by the usurpation of small self-elected bodies of burgesses, the choice of members had fallen into the hands of town councils and neighbouring landowners. The anomalous system of close and nomination boroughs, which had arisen thus early in English history, was suffered to continue without a check for four centuries, as a notorious blot upon a free constitution. None the less during the period of what Stubbs called the "Lancastrian experiment" there was a marked, though premature, period of parliamentary ascendancy, due, no doubt, to the fact that the Lancastrian kings themselves reigned under a parliamentary title The Commons frequently asserted, and made good, a claim that the king's councillors should be named in parliament, although they were very far from asserting the modern principle of "responsible government."

The Three Estates of the Realm.—This check in the fortunes of parliament affords a fitting occasion for examining the composition of each of the three estates of the realm. The archbishops and bishops had held an eminent position in the councils of Saxon and Norman kings, and many priors and abbots were from time to time associated with them as lords spiritual, until the suppression of the monasteries by Henry VIII. They generally outnumbered their brethren, the temporal peers, who sat with them in the same assembly The king can create new bishoprics by Order in Council but his power to summon them to parliament is now limited by the Act of 1878 which limits the number of Lords Spiritual to 26.

The lords temporal comprised several dignities. Of these the baron, though now the lowest in rank, was the most ancient. The title was familiar in Saxon times, but it was not until after the Norman Conquest that it was invested with a distinct feudal dignity. Next in antiquity was the earl, whose official title was known to Danes and Saxons, and who after the Conquest obtained a dignity equivalent to that of count in foreign States. The highest dignity, that of duke, was not created until Edward III conferred it upon his son, Edward the Black Prince. The rank of marquess was first created by Richard II, with precedence after a duke. It was in the reign of Henry VI. that the rank of viscount was created, to be placed between the earl and the baron. Thus the peerage consisted of five dignities of duke, marquess, earl, viscount and baron. During the 15th century the number of temporal peers summoned to parliament rarely exceeded 50, and no more than 29 received writs of summons to the first parliament of Henry VII There were only 59 at the death of Queen Elizabeth At the accession of William III. this number had been increased to about 150. The most important step in the development of the independence of the Lords is their successful assertion in the *Earl of Bristol's case*, in the reign of Charles I, that once the king had issued a writ of summons to a subject to attend the House of Lords and it had been obeyed, a hereditary right to the writ had been created and vested in his heirs. The king's prerogative to create new peerages of the United Kingdom remains unlimited, except as regards the "limitation" or definition of the mode of descent. (*See* PEERAGE.) By an Act of 1887 he has the power to create four life peerages in the case of the "law lords" who sit in a judicial council for the hearing of appeals.

The Commons formed a more numerous body. In the reign of Edward I. there were about 275 members, in that of Edward III. 250, and in that of Henry VI. 300. In the reign of Henry VIII parliament added 27 members for Wales and four for the county and city of Chester, and in the reign of Charles II. four for the county and city of Durham. Between the reigns of Henry VIII and Charles II. 130 members were also added by royal charter.

Parliament Under the Tudors.—To resume the history of parliament at a later period, let us glance at the reign of Henry VIII. Never had the power of the Crown been greater than when this king succeeded to the throne, and never had a more imperious will been displayed by any king of England. Parliament was at his feet to do his bidding, and the Reformation enormously increased his power He had become a pope to the bishops; the old nobles who had resisted his will had perished in the field or on the scaffold; the new nobles were his creatures;

and he had the vast wealth of the church in his hands as largesses to his adherents. Such was the dependence of parliament upon the Crown and its advisers during the Reformation period that in less than 30 years four vital changes were decreed in the national faith. Each of the successive reigns inaugurated a new religion.

With the reign of Elizabeth commenced a new era in the life of parliament. She had received the royal prerogatives unimpaired, and her hand was strong enough to wield them. But in the long interval since Edward IV. the entire framework of English society had been changed; it was a new England that the queen was called upon to govern. The coarse barons of feudal times had been succeeded by English country gentlemen, beyond the influence of the court, and identified with all the interests and sympathies of their country neighbours. From this class were chosen nearly all the knights of the shire, and a considerable proportion of the members for cities and boroughs. They were generally distinguished by a manly independence, and were prepared to uphold the rights and privileges of parliament and the interests of their constituents. In the country the yeomen and farmers were far superior to the cultivators of the soil in feudal times; and the towns and seaports had become important centres of commerce and manufactures.

The parliaments of Elizabeth, though rarely summoned, displayed an unaccustomed spirit They discussed the succession to the Crown, the marriage of the queen, and ecclesiastical abuses; they upheld the privileges of the Commons and their right to advise the Crown upon all matters of State; and they condemned the grant of monopolies. The bold words of the Wentworths and Yelvertons were such as had not been heard before in parliament The conflicts between Elizabeth and the Commons marked the revival of the independence of parliament, and foreshadowed graver troubles at no distant period

The Stuart Kings.—James I, with short-sighted pedantry, provoked a succession of conflicts with the Commons, in which abuses of prerogative were stoutly resisted and the rights and privileges of parliament resolutely asserted. The "remonstrance" of 1610 and the "protestation" of 1621 would have taught a politic ruler that the Commons could no longer be trifled with, but those lessons were lost upon James and upon his ill-fated son

The momentous struggles between Charles I and his parliaments cannot be followed in this place The earlier parliaments of this reign fairly represented the earnest and temperate judgment of the country They were determined to obtain the redress of grievances and to restrain undue prerogatives; but there was no taint of disloyalty to the Crown; there were no dreams of revolution But the contest at length became embittered, until there was no issue but the arbitrament of the sword The period of the Great Rebellion and the Commonwealth proved the supreme power of the Commons, when supported by popular forces. Everything gave way before them They raised victorious armies in the field, they overthrew the church and the House of Lords, and they brought the king himself to the scaffold.

It is to this time of fierce political passions that we trace the origin of political agitation as an organized method of influencing the deliberations of parliament. The whole country was then aroused by passionate exhortations from the pulpit and in the press. No less than 30,000 political tracts and newspapers during this period have been preserved Petitions to parliament were multiplied in order to strengthen the hands of the popular leaders Clamorous meetings were held to stimulate or overawe parliament Such methods, restrained after the Restoration, have been revived in later times, and now form part of the acknowledged system of parliamentary government.

Parliament After the Restoration.—On the restoration of Charles II. parliament was at once restored to its old constitution, and its sittings were revived as if they had suffered no interruption. No outward change had been effected by the late revolution; but that a stronger spirit of resistance to abuses of prerogative had been aroused was soon to be disclosed in the deposition of James II and "the glorious revolution" of 1688 At this time the full rights of parliament were explicitly declared, and securities taken for the maintenance of public liberties. The end of the Stuart dynasty marked the final triumph of the principle of parliamentary sovereignty. Henceforth it is never again disputed that parliament may abolish the prerogatives and alter the common law. (*See* PREROGATIVE; COMMON LAW; PRIVY COUNCIL.) The theory of a constitutional monarchy and a free parliament was established; but after two revolutions it is curious to observe the indirect methods by which the Commons were henceforth kept in subjection to the Crown and the territorial aristocracy. The representation had long become an illusion The knights of the shire were the nominees of nobles and great landowners; the borough members were returned by the Crown, by noble patrons or close corporations; even the representation of cities, with greater pretensions to independence, was controlled by bribery. Nor were rulers content with their control of the representation, but, after the Restoration, the infamous system of bribing the members themselves became a recognized instrument of administration. The country gentlemen were not less attached to the principles of rational liberty than their fathers, and would have resisted further encroachments of prerogatives; but they were satisfied with the Revolution settlement and the remedial laws of William III., and no new issue had yet arisen to awaken opposition. Accordingly, they ranged themselves with one or other of the political parties into which parliament was now beginning to be divided, and bore their part in the more measured strifes of the 18th century From the Revolution till the reign of George III the effective power of the State was wielded by the Crown, the church and the territorial aristocracy, but the influence of public opinion since the stirring events of the 17th century had greatly increased Both parties were constrained to defer to it; and, notwithstanding the flagrant defects in the representation, parliament generally kept itself in accord with the general sentiments of the country

On the union of Scotland in 1707 important changes were made in the constitution of parliament The House of Lords was reinforced by the addition of 16 peers, representing the peerage of Scotland, and elected every parliament; and the Scottish peers, as a body, were admitted to all the privileges of peerage, except the right of sitting in parliament or upon the trial of peers. No prerogative, however, was given to the Crown to create new peerages after the union; and, while they are distinguished by their antiquity, their number is consequently decreasing To the House of Commons were assigned 45 members, representing the shires and burghs of Scotland

Parliament Under George III.—With the reign of George III. there opened a new period in the history of parliament. Agitation in its various forms, an active and aggressive press, public meetings and political associations, the free use of the right of petition, and a turbulent spirit among the people seriously changed the relations of parliament to the country And the publication of debates, which was fully established in 1771, at once increased the direct responsibility of parliament to the people, and ultimately brought about other results, to which we shall presently advert.

In this reign another important change was effected in the constitution of parliament Upon the union with Ireland, in 1801, four Irish bishops were added to the lords spiritual, who sat by rotation of sessions, and represented the episcopal body of the Church of Ireland But those bishops were deprived of their seats in parliament in 1869, on the disestablishment of the Church of Ireland. Twenty-eight representative peers, elected for life by the peerage of Ireland, were admitted to the House of Lords All the Irish peers were also entitled to the privilege of peerage In two particulars the Irish peerage was treated in a different manner from the peerage of Scotland The Crown was empowered to create a new Irish peerage whenever three Irish peerages in existence at the time of the Union have become extinct, or when the number of Irish peers, exclusive of those holding peerages of the United Kingdom, has been reduced to 100. And, further, Irish peers were permitted to sit in the House of Commons for any place in Great Britain, forfeiting, however, the privilege of peerage while sitting in the lower house

At the same time 100 representatives of Ireland were added to the House of Commons. This addition raised the number of members to 658 Parliament now became the parliament of the United Kingdom. In 1922 (*see* p 326) the provisions of the Act of Union

as to the representation of Ireland in the Commons were, save in the case of "Northern Ireland," repealed and the term "United Kingdom" is now restricted to Great Britain and Northern Ireland.

Schemes for Improving the Representation.—By the union of Scotland and Ireland the electoral abuses of those countries were combined with those of England. Notwithstanding a defective representation, however, parliament generally sustained its position as fairly embodying the political sentiments of its time. Public opinion had been awakened, and could not safely be ignored by any party in the State. Under a narrow and corrupt electoral system the ablest men in the country found an entrance into the House of Commons; and their rivalry and ambition ensured the acceptance of popular principles and the passing of many remedial measures. As society expanded, and new classes were called into existence, the pressure of public opinion upon the legislature was assuming a more decisive character. The grave defects of the representation were notorious, and some minor electoral abuses had been from time to time corrected. But the fundamental evils —nomination boroughs, limited rights of election, the sale of seats in parliament, the prevalence of bribery, and the enormous expense of elections—though constantly exposed, long held their ground against all assailants. All moderate proposals were rejected till the concurrence of a dissolution, on the death of George IV., with the French Revolution in 1830, and an ill-timed declaration of the duke of Wellington that the representation was perfect and could not be improved, suddenly precipitated the memorable crisis of parliamentary reform. (*See* also REFORM MOVEMENT.)

The Reform Acts of 1832.—The result of the memorable struggle which ensued may be briefly told. By the Reform Acts of 1832 the representation of the United Kingdom was reconstructed. In England, 56 nomination boroughs returning 111 members were disfranchised; 30 boroughs were each deprived of one member, and Weymouth and Melcombe Regis, which had returned four members, were now reduced to two. Means were thus found for the enfranchisement of populous places. Twenty-two large towns, including metropolitan districts, became entitled to return two members, and 20 less considerable towns acquired the right of returning one member each. The number of county members was increased from 94 to 159, the larger counties being divided for the purposes of representation.

The elective franchise was also placed upon a new basis. In the boroughs a £10 household suffrage was substituted for the narrow and unequal franchises which had sprung up—the rights of freemen, in corporate towns, being alone respected. In the counties, copyholders and leaseholders for terms of years, and tenants at will paying a rent of £50 a year, were added to the 40s. freeholders. Reform Acts, similar in character, were passed to deal with the franchise and constituencies in Ireland and Scotland respectively. The most decisive feature of these Reform Acts was not so much the extension of the franchise, as five-sixths of the male adult population were still left without a vote, the working-classes being practically without a vote. But what the Acts did do, once and for all, was to take the control of the constituencies, particularly by the disfranchisement of the "rotten boroughs," out of the hands of the peers who had hitherto bought or sold the right of nomination of candidates. From henceforth the political balance of power was shifted from the Lords to the Commons.

The legislature was now brought into closer relations with the people, and became more sensitive to the pressure of popular forces. The immediate effects of this new spirit were perceptible in the increased legislative activity of the reformed parliament, its vigorous grappling with old abuses, and its preference of the public welfare to the narrower interests of classes. But, signal as was the regeneration of parliament, several electoral evils still needed correction. Strenuous efforts were made, with indifferent success, to overcome bribery and corruption, and proposals were often ineffectually made to restrain the undue influence of landlords and employers of labour by the ballot; improvements were made in the registration and polling of electors, and the property qualification of members was abolished. Complaints were also urged that the middle classes had been admitted to power, while the working classes were excluded from the late scheme of enfranchisement. It was only with the enactment of the second Reform Act of 1867 that the working-classes were admitted to the franchise in the borough, by the introduction of what was known as "household franchise," *i.e.*, inhabitant occupation without any minimum restriction of annual value. . In 1884 this franchise qualification was extended to the counties, thereby enabling the agricultural labourer to exercise a vote. Other important stages in reform were the Acts removing a property qualification for election to the House (1858) and securing freedom of election by the secrecy of the ballot (1872).

Prior to the reign of Charles I. the condition of society had been such as naturally to subordinate the Commons to the Crown and the Lords. After the Revolution of 1688 society had so far advanced that, under a free representation, the Commons might have striven with both upon equal terms. But, as by far the greater part of the representation was in the hands of the king and the territorial nobles, the large constitutional powers of the Commons were held safely in check. After 1832, when the representation became a reality, a corresponding authority was asserted by the Commons. For several years, indeed, by reason of the weakness of the Liberal party, the Lords were able successfully to resist the Commons upon many important occasions; but it was soon acknowledged that they must yield whenever a decisive majority of the Commons, supported by public opinion, insisted upon the passing of any measure, however repugnant to the sentiments of the upper house. And it became a political axiom that the Commons alone determined the fate of ministries.

Results of Reform Since 1832.—From a constitutional standpoint it is important to recognize the results of the successive Reform Acts on the working of parliament as regards the position of the executive on the one hand and the electorate on the other. Before 1832 the functions of ministers were mainly administrative, and parliament was able to deal much as it pleased with their rare legislative proposals without thereby depriving them of office. Moreover, since before that date ministers were, generally speaking, in fact as well as in theory appointed by the king, while the general confidence of the majority in the House of Commons followed the confidence not so much of the electorate as of the Crown, that house was able on occasions to exercise an effective control over foreign policy. Pitt, after 1784, was defeated several times on foreign and domestic issues, yet his resignation was neither expected nor desired. In 1788, when the regency of the prince of Wales appeared probable, and again in 1812, it was generally assumed that it would be in his power to dismiss his father's ministers and to maintain the Whigs in office without dissolving parliament. This system, while it gave to ministers security of tenure, left much effective freedom of action to the House of Commons. But the Reform Act of 1832 introduced a new order of things. In 1835 the result of a general election was for the first time the direct cause of a change of ministry, and in 1841 a House of Commons was elected for the express purpose of bringing a particular statesman into power. The electorate voted for Sir Robert Peel, and it would have been as impossible for the house then elected to deny him their support as it would be for the college of electors in the United States to exercise their private judgment in the selection of a president. As time went on, and the party system became more closely organized in the enlarged electorate, the voting power throughout the country came to exercise an increasing influence. The premier was now a party leader who derived his power in reality neither from the Crown nor from parliament, but from the electorate, and to the electorate he could appeal if deserted by his parliamentary majority. Unless it was prepared to drive him from the office in which it was elected to support him, that majority would not venture to defeat, or even seriously to modify, his legislative proposals, or to pass any censure on his foreign policy for all such action would now be held to be equivalent to a vote of no confidence. From the passing of the Reform Act of 1867 down to 1900 (with a single exception due to the lowering of the franchise

and the redistribution of seats) the electorate voted alternately for the rival party leaders, and it was the function of the houses elected for that purpose to pass the measures and to endorse the general policy with which those leaders were respectively identified. The cabinet (*q.v.*), composed of colleagues selected by the prime minister, had practically, though indirectly, become an executive committee acting on behalf of the electorate, that is to say, the majority which returned their party to office; and the House of Commons practically ceased to exercise control over ministers except in so far as a revolt in the party forming the majority could influence the prime minister, or force him to resign or dissolve. Meanwhile, the virtual identificaton of the electorate with the nation by the successive extensions of the franchise added immensely to its power, the chief limitation being supplied by the Septennial Act. The House of Lords, whatever its nominal rights, came henceforth in practice to exercise restriction rather on the House of Commons than on the will of the electorate, for the acquiescence of the upper house in the decision of the electors, when appealed to on a specific point of issue between the two houses, was gradually accepted by its leaders as a constitutional convention.

The history of parliament, as an institution, centres in this later period round two points, (A) the friction between Lords and Commons, resulting in proposals for the remodelling of the upper house, and (B) the changes in procedure within the House of Commons, necessitated by new conditions of work and the desire to make it a more business-like assembly.

A. **House of Lords Question.**—The parliament which met at Westminster in Aug. 1892 was more democratic in its tendencies than any of its predecessors. At the beginning of the session of 1893, in the course of which the Home Rule Bill was passed by the House of Commons, Government bills were introduced for quinquennial parliaments, for the amendment of registration, and for the limitation of each elector to a single vote. But the rejection of the Home Rule Bill by the House of Lords, with the apparent acquiescence of the country, combined with the retirement of Gladstone to weaken the influence of this House of Commons, and small importance was attached to its abstract resolutions. In the ensuing session of 1894 an amendment to the Address condemning the hereditary principle was moved by Labouchere, and carried by 147 to 145. The Government, however, holding that this was not the way in which a great question should be raised, withdrew the Address, and carried another without the insertion. In his last public utterance Gladstone directed the attention of his party to the reform of the House of Lords, and Lord Rosebery endeavoured to concentrate on such a policy the energies of his supporters at the general election. But the result of the dissolution of 1895, showing, as it did, that on the chief political issue of the day the electorate had agreed with the House of Lords and had disagreed with the House of Commons, greatly strengthened the upper house, and after that date the subject was but little discussed until the Liberal party again came into power ten years later. The House of Lords claimed the right to resist changes made by the House of Commons until the will of the people had been definitely declared, and its defenders contended that its ultimate dependence on the electorate, now generally acknowledged, rendered the freedom from ministerial control secured to it by its constitution a national safeguard.

In 1907, under the Radical Government of Sir H. Campbell-Bannerman (*q.v.*), the conflict between the Commons and the Lords again became more acute. And the prime minister in May obtained a large majority in the lower house for a resolution, on which a bill was to be founded, involving a complicated method of overriding the will of the Lords when the Commons had three times passed a bill. But no further immediate step was taken. In 1908 a strong committee of the House of Lords with Lord Rosebery as chairman, which had been appointed in consequence of the introduction by Lord Newton of a bill for reforming the constitution of the upper house, presented an interesting report in favour of largely restricting the hereditary element and adopting a method of selection.

So the question stood when in 1909 matters came to a head through the introduction of Lloyd George's budget. It had always been accepted as the constitutional right of the House of Lords to reject a financial measure sent up by the Commons but not to amend it, but the rejection of the budget (which was, in point of form, referred to the judgment of the electorate) now precipitated a struggle with the Liberal party, who had persistently denied any right on the part of the upper house to force a dissolution. The Liberal leaders contended that, even if constitutional, the claim of the House of Lords to reject a budget was practically obsolete, and having been revived must now be formally abolished; and they went to the country for a mandate to carry their view into law. The elections of Jan. 1910 gave an unsatisfactory answer, since the two principal parties, the Liberals and the Unionists, returned practically equal; but the Liberal Government had also on their side the Irish Nationalist and the Labour parties, which gave them a majority in the House of Commons if they could concentrate the combined forces on the House of Lords question. This Asquith contrived to do; and having introduced and carried through the House of Commons a series of resolutions defining his proposals, he had also tabled a bill which was to be sent up to the House of Lords, when the death of the king suddenly interrupted the course of the constitutional conflict, and gave a breathing-space for both sides to consider the possibility of coming to terms. In June Asquith took the initiative in inviting the leaders of the Opposition to a conference with closed doors, and a series of meetings between four representatives of each side were begun. The Government were represented by Asquith, Lloyd George, Birrell and Lord Crewe. The Unionists were represented by Balfour, Lord Lansdowne, Austin Chamberlain and Lord Cawdor.

The situation on the Radical side at this juncture may be best understood by reference to the resolutions passed in the House of Commons, and the text of a "Parliament Bill" of which Asquith had given notice. The text, alike of the resolutions and of the Parliament Bill, virtually disestablishing the House of Lords as a co-equal and independent estate of the realm in legislation, was almost identical with the subsequent Parliament Act of 1911 (*see* p. 324) and as such it received a kind of "mandate" at the General Election of Dec. 1910.

Meanwhile, in the House of Lords, Lord Rosebery had carried three resolutions declaring certain principles for the reform of the second chamber, which were assented to by the Unionist leaders; the policy opposed to that of the Government thus became that of willingness for reform of the constitution of the Upper Chamber, but not for abolition of its powers.

During the summer and autumn the private meetings between the eight leaders were continued, until 20 had been held. But on Nov. 10 Asquith issued a brief statement that the conference on the constitutional question had come to an end, without arriving at an agreement. Within a few days he announced that another appeal would at once be made to the electorate. The Parliament Bill was hurriedly introduced into the House of Lords, with a statement by Lord Crewe that no amendments would be accepted. The dissolution was fixed for Nov. 28. Time was short for any declaration of policy by the Unionist peers, but it was given shape at once, first by the adoption of a further resolution moved by Lord Rosebery for the remodelling of the Upper House, and secondly by Lord Lansdowne's shelving the Parliament Bill by coupling the adjournment of the debate on it with the adoption of resolutions providing for the settlement of differences between a reconstituted Upper House and the House of Commons. These resolutions still possess something more than historical importance, in view of the revival in 1927, by the Conservative Party, of plans for the reform of the House of Lords.

Lord Rosebery's additional resolution provided that "in future the House of Lords shall consist of lords of parliament: (*a*) chosen by the whole body of hereditary peers from among themselves and by nomination by the Crown; (*b*) sitting by virtue of offices and of qualifications held by them; (*c*) chosen from outside." The Lansdowne resolutions provided in effect that, when the House of Lords had been "reconstituted and reduced in num-

bers" in accordance with Lord Rosebery's plan, (1) any differences arising between the two houses with regard to a bill other than a money bill, in two successive sessions, and within an interval of not less than one year, should be settled, if not adjustable otherwise, in a joint sitting composed of members of both houses, except in the case of "a matter which is of great gravity and has not been adequately submitted to the judgment of the people," which should then be "submitted for decision to the electors by Referendum"; (2) and as to money bills, the Lords were prepared to forgo their constitutional right of rejection or amendment, if effectual provision were made against "tacking," the decision whether other than financial matters were dealt with in the bill resting with a joint committee of both Houses, with the Speaker of the House of Commons as chairman, having a casting vote only.

The general election took place in December, and resulted practically in no change from the previous situation. Asquith retained an apparent majority of 126 for the ministerial policy, resting as it did on the determination of the Irish Nationalists to pave the way for Home Rule by destroying the veto of the House of Lords.

B. **House of Commons Internal Reforms.**—We have already sketched the main lines of English parliamentary procedure. Until the forms of the House of Commons were openly utilized to delay the progress of Government business by what became known as "obstruction" the changes made in the years following 1832 were comparatively insignificant. They consisted in (1) the discontinuance of superfluous forms, questions and amendments; (2) restrictions of debates upon questions of form; (3) improved arrangements for the distribution of business; (4) the delegation of some of the minor functions of the house to committees and officers of the house; and (5) increased publicity in the proceedings of the house. But with the entry of Parnell and his Irish Nationalist followers into parliament (1875–80) a new era began in the history of the House of Commons. Their tactics were to oppose all business of whatever kind, and at all hours.

It was not until Feb. 1880 that the house so far overcame its reluctance to restrict liberty of discussion as to pass, in its earliest form, the rule dealing with "order in debate." It provided that whenever a member was named by the Speaker or chairman as "disregarding the authority of the chair, or abusing the rules of the house by persistently and wilfully obstructing the rules of the house," a motion might be made, to be decided without amendment or debate, for his suspension from the service of the house during the remainder of the sitting; and that if the same member should be suspended three times in one session, his suspension on the third occasion should continue for a week, and until a motion had been made upon which it should be decided, at one sitting, by the house, whether the suspension should then cease or not. The general election, which took place two months later, restored Gladstone to power and to the leadership of the house. Parnell returned to parliament with a more numerous following, and resumed his former tactics. In Jan. 1881 the Protection of Persons and Property (Ireland) Bill was introduced. For 22 hours Parnell fought the motion giving precedence to the bill, and for four sittings its introduction. The fourth sitting lasted 41 hours. Then Mr. Speaker Brand intervened, and declined to call on any other member who might rise to address the house, because repeated dilatory motions had been supported by small minorities in opposition to the general sense of the house. He added: "A crisis has thus arisen which demands the prompt interposition of the chair and of the house. The usual rules have proved powerless to ensure orderly and effective debate. An important measure, recommended by Her Majesty nearly a month since, and declared to be urgent in the interests of the State by a decisive majority, is being arrested by the action of an inconsiderable minority, the members of which have resorted to those modes of obstruction which have been recognized by the house as a parliamentary offence. The dignity, the credit and the authority of this house are seriously threatened, and it is necessary they should be vindicated. . . . Future measures for ensuring orderly debate I must leave to the judgment of the house. But the house must either assume more effectual control over its debates, or entrust greater powers to the chair." The Speaker then put the question, which was carried by an overwhelming majority. Then followed the decisive struggle. Gladstone gave notice for the next day (Feb. 3) of an urgency rule, which ordered, "That if the house shall resolve by a majority of three to one that the State of public business is urgent, the whole power of the house to make rules shall be and remain with the Speaker until he shall declare that the state of public business is no longer urgent." On the next day a scene of great disorder ended in the suspension of the Nationalist members, at first singly, and afterwards in groups. The urgency rule was then passed without further difficulty, and the house proceeded to resolve, "That the state of public business is urgent." The Speaker laid upon the table rules of sufficient stringency, and while they remained in force progress in public business was possible. During this session the Speaker had to intervene on points of order 935 times, and the chairman of committees 939 times; so that, allowing only five minutes on each occasion, the wrangling between the chair and members occupied 150 hours.

The Closure.—The events of the session of 1881 and the direct appeal of the Speaker to the house proved the necessity of changes in the rules of procedure more drastic than had hitherto been proposed. Accordingly, in the first week of the session of 1882 Gladstone laid his proposals on the table, and in moving the first resolution on Feb. 20, he reviewed, in an eloquent speech, the history of the standing orders. It was his opinion, on general grounds, that the house should settle its own procedure, but he showed that the numerous committees which, since 1832, had sat on the subject, had failed for the most part to carry their recommendations into effect from the lack of the requisite "propelling power," and he expressed his regret that the concentration of this power in the hands of the Government had rendered it necessary that they should undertake a task not properly theirs. He defined obstruction as "the disposition either of the minority of the house, or of individuals, to resist the prevailing will of the house otherwise than by argument," and reached the conclusion that the only remedy for a state of things by which the dignity and efficiency of the house were alike compromised, was the adoption in a carefully guarded form of the process known on the Continent as the "clôture." The power to close debate had been of necessity assumed by almost all the European and American assemblies, the conduct of whose members was shaped by no traditional considerations; and the entry into parliament of a body of men to whom the traditions of the house were as nothing made it necessary for the House of Commons to follow this example. He proposed, therefore, that when it appeared to the Speaker, or to the chairman of committees, during any debate to be the evident sense of the house, or of the committee, that the question be now put, he might so inform the house, and that thereupon on a motion being made, "That the question be now put," the question under discussion should be forthwith put from the chair, and decided in the affirmative if supported by more than 200 members, or, when less than 40 members had voted against it, by more than 100 members. This resolution was vehemently contested by the opposition, who denounced it as an unprecedented interference with the liberty of debate, but was eventually carried in the autumn session of the same year, after a discussion extending over 19 sittings.

On Nov. 20 the standing order of Feb. 28, 1880, providing for the suspension of members who persistently and wilfully obstructed the business of the house or disregarded the authority of the chair, was amended by the increase of the penalty to suspension on the first occasion for one week, on the second occasion for a fortnight, and on the third, or any subsequent occasion, for a month. The other rules, framed with a view to freeing the wheels of the parliamentary machine, and for the most part identical with the regulations adopted by Mr. Speaker Brand under the urgency resolution of 1881, were carried in the course of the autumn session, and became standing orders on Nov. 27.

Gladstone's closure rule verified neither the hopes of its supporters nor the fears of its opponents. It was not put into operation until Feb. 20, 1885, when the Speaker's declaration of the evident sense of the house was ratified by a majority of 207—

a margin of but seven votes over the necessary quorum. It was clear that no Speaker was likely to run the risk of a rebuff by again assuming the initiative unless in the face of extreme urgency, and, in fact, the rule was enforced twice only during the five years of its existence.

In 1887 the Conservative Government, before the introduction of a new Crimes Act for Ireland, gave efficiency to the rule by an important amendment They proposed that any member during a debate might claim to move, "That the question be now put," and that with the consent of the chair this question should be put forthwith, and decided without amendment or debate *Thus the initiative was transferred from the Speaker to the house.* Gladstone objected strongly to this alteration, chiefly on the ground that it would throw an unfair burden of responsibility upon the Speaker, who would now have to decide on a question of opinion, whereas under the old rule he was only called upon to determine a question of evident fact. The alternative most generally advocated by the opposition was the automatic closure by a bare majority at the end of each sitting, an arrangement by which the chair would be relieved from an invidious responsibility; but it was pointed out that under such a system the length of debates would not vary with the importance of the questions debated After 14 sittings the closure rule was passed on March 18 and made a standing order

In the next session, on Feb 28, 1888, the rule was yet further strengthened by the reduction of the majority necessary for its enforcement from 200 to 100, the closure rule remaining as follows. That, after a question has been proposed, a member rising in his place may claim to move, "That the question be now put," and, unless it shall appear to the chair that such motion is an abuse of the rules of the house or an infringement of the rights of the minority, the question, "That the question be now put," shall be put forthwith, and decided without amendment or debate

When the motion "That the question be now put" has been carried, and the question consequent thereon has been decided, any further motion may be made (the assent of the chair as aforesaid not having been withheld), which may be requisite to bring to a decision any question already proposed from the chair; and also if a clause be then under consideration, a motion may be made (the assent of the chair as aforesaid not having been withheld), "That the question 'That certain words of the clause defined in the motion stand part of the clause,' or 'That the clause stand part of, or be added to, the bill,' be now put " Such motions shall be put forthwith, and decided without amendment or debate.

That questions for the closure of debate shall be decided in the affirmative, if, when a division be taken, it appears by the numbers declared from the chair that not less than 100 members voted in the majority in support of the motion

The Guillotine.—The closure, originally brought into being to defeat the tactics of obstruction in special emergencies, thus became a part of parliamentary routine And, the principle being once accepted, its operation was soon extended It can now be put into operation not only in committee of the whole house but in any of the "grand" standing committees Furthermore, the practice of retarding the progress of Government measures by amendments moved to every line, adopted by both the great political parties when in opposition, led to the use of what became known as the "guillotine," for forcing through parliament important bills, most of the clauses in which were thus undiscussed. The "guillotine," means that the house decides how much time shall be devoted to certain stages of a measure, definite dates being laid down at which the closure shall be enforced and division taken On June 17, 1887, after prolonged debates on the Crimes Bill in committee, clause 6 only having been reached, the remaining 14 clauses were put without discussion, and the bill was reported in accordance with previous notice. This was the first use of the "guillotine," but the precedent was followed by Gladstone in 1893, when many of the clauses of the Home Rule Bill were carried through committee and on report by the same machinery. To the Conservatives must be imputed the invention of this method of legislation, to their opponents the use of it for attempting to carry a great constitutional innovation to which the majority of English and Scottish representatives were opposed, and subsequently its extension and development (1906–09) as a regular part of the legislative machinery.

Supply Rule.—The principle of closure has been extended even to the debates on supply. The old rule, that the redress of grievances should precede the granting of money, dating from a time when the minister of the Crown was so far from commanding the confidence of the majority in the House of Commons that he was the chief object of their attacks, nevertheless continued to govern the proceedings of the house in relation to supply without much resultant inconvenience, until the period when the new methods adopted by the Irish Nationalist party created a new situation Until 1872 it continued to be possible to discuss any subject by an amendment to the motion for going into supply In that year a resolution was passed limiting the amendments to matters relevant to the class of estimates about to be considered, and these relevant amendments were further restricted to the first day on which it was proposed to go into committee. This resolution was continued in 1873, but was allowed to drop in 1874 It was revived in a modified form in 1876, but was again allowed to drop in 1877 In 1879, on the recommendation of the Northcote committee, it was provided in a sessional order that whenever the committees of supply or of ways and means stood as the first order on a Monday, the Speaker should leave the chair without question put, except on first going into committee on the army, navy and civil service estimates respectively. In 1882 Thursday was added to Monday for the purposes of the order, and, some further exceptions having been made to the operation of the rule, it became a standing order. The conditions, however, under which the estimates were voted remained unsatisfactory. The most useful function of the opposition is the exposure of abuses in the various departments of administration, and this can best be performed upon the estimates But ministers, occupied with their legislative proposals, were irresistibly tempted to postpone the consideration of the estimates until the last weeks of the session, when they were hurried through thin houses, the members of which were impatient to be gone To meet this abuse, and to distribute the time with some regard to the comparative importance of the subjects discussed, Balfour in 1896 proposed and carried a sessional order for the closure of supply, a maximum of 23 days being given to its consideration, of which the last three alone might be taken after Aug 5. On the last but one of the allotted days at 10 o'clock the chairman was to put the outstanding votes, and on the last day the Speaker was to put the remaining questions necessary to complete the reports of supply In 1901 Balfour so altered the resolution that the question was put, not with respect to each vote, but to each class of votes in the Civil Service estimates, and to the total amounts of the outstanding votes in the army, navy and revenue estimates.

Other Changes in Methods.—It is only possible here to refer briefly to some other changes in the procedure of the house which altered in various respects its character as a business-like assembly The chief of these is as regards the hours. On Mondays, Tuesdays, Wednesdays and Thursdays the house meets at 2 45 P M, "questions" beginning at 3 and ending (apart from urgency) at 3 45, and opposed business ends at 11. On Fridays the house meets at 12 noon, and opposed business is suspended at 5 P M; this is the only day when Government business has not precedence, and private members' bills have the first call, though at 8 15 P.M. on Tuesdays and Wednesdays up to Easter and on Wednesdays up to Whitsuntide the business is interrupted in order that private members' motions may be taken These arrangements, which only date from 1906, represent a considerable change from the old days before 1879 when the standing order was formed that no opposed business, with certain exceptions, should be taken after 12.30 A M., or 1888 when the closing hour was fixed at midnight. In fact the hours of the house have become generally earlier. Another important change has been made as regards motions for the adjournment of the house, which used to afford an opportunity to the private members at any time to discuss matters of urgent importance.

Since 1902 no motion for the adjournment of the house can be made until all "questions" have been disposed of, and then, if 40 members support it, the debate takes place at 8.15 P.M. This alteration has much modified the character of the debates on such motions, which used to be taken when feelings were hot, whereas now there is time for reflection. In other respects the most noticeable thing in the recent evolution of the House of Commons has been its steady loss of power, as an assembly, in face of the control of the Government and party leaders In former times the private members had far larger opportunities for introducing and carrying bills, which now have no chance, unless the Government affords "facilities"; and the great function of debating "supply" has largely been restricted by the closure, under which millions of money are voted without debate The house is still ruled by technical rules of procedure which are, in the main, dilatory and obstructive, and hamper the expression of views which are distasteful to the Whips or to the Government, who can by them arrange the business so as to suit their convenience. The most striking feature in procedural development in recent years is the almost complete appropriation to "Government business" of parliamentary time. As an independent source of legislation, the private member has, in consequence, virtually disappeared and, unless the Government choose to adopt as their own a bill introduced by him, it has no chance of finding its way on to the statute-book. (H C.; X.)

PARLIAMENT SINCE 1910

The General Election of 1910 was fought on the issue, already placed before the Commons in a series of Resolutions which were moved by the Prime Minister during the summer of that year, of the legislative supremacy of the Commons over the Lords. The success of the Government at the polls decided the fate of the Upper House, the more decisively as it eventually became known that the Prime Minister had on asking for a dissolution obtained a contingent pledge from the King that he would in the event of his being returned to power at the General Election be authorized to "exercise the prerogative" in the event of the Lords rejecting the "Parliament Bill" which embodied the Government proposals. In other words the House of Lords were faced with the same coercion as that which confronted them in their opposition to the Reform Bill in 1832, namely an announcement, duly made by Lord Morley in the debate on the Bill in the Lords, that, if it were rejected, the Prime Minister would advise His Majesty to create such a number of new peers as would ensure its acceptance. Faced with this tremendous exercise of the prerogative, the Lords gave way, and a constitutional revolution of the first magnitude was effected The provisions of the Act may be summarized briefly as providing (1) that the House of Lords should have no power either to reject or amend "a money bill"; a term defined as meaning any bill which, "in the opinion of the Speaker," contains "only" provisions dealing with "the imposition, repeal, alteration or regulation of taxation," and "the provision of public money, supply, appropriation and regulation of public money"; (2) that any public bill (private bills are excluded) passed by the Commons in three successive sessions, whether with or without the intervention of a General Election, should, if rejected by the House of Lords in each successive session, on its third rejection be presented to His Majesty for his assent provided that a minimum period of 2 years had elapsed since the date of the second reading in the Commons in the first session These were the main provisions of the Act and, as they have been controverted ever since, and as the Conservative party is at the present moment committed to some amendment of the first of them, they will call for careful examination in a moment. Other provisions of the Act can be summarily disposed of. The maximum "life" of Parliament is reduced from seven years to five, the statute thus involving a repeal of the Septennial Act. This provision, of course, may be repealed by Parliament itself as it is inherent in the principle of "Parliamentary sovereignty" that what one Parliament has done, another Parliament can undo and, during the war, when conditions made a dissolution extremely undesirable, Parliament passed one Act after another extending its own duration, with the result that the Parliament elected in December 1910 was not dissolved for eight years. These Acts, prolonging the life of Parliament beyond five years, required, and received, the consent of the Lords, for the Parliament Act itself preserves their absolute veto in the one, and only the one, case of bills to extend the life of Parliament. It also provides that nothing in the statute is to "diminish or qualify the existing rights and privileges of the House of Commons." The object of this clause is to preserve the claims of the Commons to dispute the right of the Lords to amend "a money clause" in an ordinary bill· a claim which has always been an object of dispute between the two Houses and which is left unsettled by the Parliament Act The statute also provides, necessarily, that a bill, to take advantage of the automatic machinery of the statute when successively rejected, must be "the same bill"—a provision which has a constricting effect on the power of the Government to amend the Bill after the first session in which it has passed the House of Commons. No amendments can be made therein without the consent of the House of Lords itself.

It remains to consider more closely the two chief provisions of the Act It should be observed in the first place that the Bill was avowedly an emergency measure, designed to secure the immediate passage into law of the legislative programme, in particular the Home Rule Bill and the Welsh Church Bill, of the Liberal Government which introduced it and secured its enactment. The preamble of the Parliament Act itself recites that "whereas it is intended to substitute for the House of Lords as it at present exists a second chamber constituted on a popular instead of a hereditary basis but such substitution cannot be immediately brought into operation." This pledge, or condition subsequent, has never been redeemed, and, during the 18 years that have elapsed, a whole series of proposals have been put forward in the Lords for the "reform" of the Upper House Moreover in August 1917, namely during the party truce imposed by the war which found expression in the establishment of the "Coalition Government," a conference representative of all parties was instituted, under the presidency of Lord Bryce, by the Prime Minister to report not only on the composition and "legislative power" to be exercised by a reformed second chamber but on "the best mode of adjusting differences between the two Houses of Parliament" These terms of reference necessarily involved a reconsideration of the Parliament Act itself and in a Report (Cd 9038 of 1918) which constitutes far and away the most valuable contribution to this vexed subject, Lord Bryce's Committee did definitely recommend some amendment of the provisions of the statute which relate to "Money Bills" and at the same time proposed to substitute a system of joint conferences in place of the suspensory veto of the Lords over public bills other than money bills. Such a considerable restoration of the powers of the Upper House was only possible on the assumption that it become a representative body in the "popular" sense, and for this the Bryce scheme provided by substituting for the peerage qualification an elective element, amounting to no less than three-fourths of the House, to be elected by the House of Commons, while, even in the election by a "Joint Standing Committee" of both Houses of the remaining one-quarter, the peers selected by the Joint Committee were ultimately to be reduced to thirty. The scheme failed of acceptance, and the most recent proposals, put forward by Lord Cave on behalf of the Government in 1927, abandoned all idea of transforming the Upper House into a predominantly representative Chamber, and are confined, with the exception of some provision for a small number of Crown nominees for a term of years, to the adoption of the principle of "representative peers" already domesticated in our Constitution in the case of Scottish and Irish peerages—in other words the new chamber was to consist of a fixed number of peers elected by their fellow-peers.

The basis of the constitution of the House of Lords being left much where it was—namely the peerage qualification—these proposals did not suggest any such far-reaching revision of

the Parliament Act as that contained in the Bryce scheme, but were directed to the interposition of some very necessary safeguards against the abuse of the Parliament Act. Indeed Lord Lansdowne had already declared himself in 1925 as "wholly opposed to any attempt" to repeal the Parliament Act itself. The Government proposals of 1927 were, and are, therefore confined to two propositions, one of which is that no legislative proposals for further curtailing such powers, *e.g.*, the suspensory veto, as are conceded to the House of Lords by the Parliament Act, should be forced into law by the machinery of the Parliament Act itself but should require the assent of the House of Lords. The effect of this proposal, which is reasonable enough, would be to prevent an extremist majority in the House of Commons extinguishing, by a bill to that effect, the House of Lords altogether as an estate of the realm by forcing such a bill on to the statute-book in the three successive sessions provided for in the case of ordinary legislation under the Parliament Act The other proposition gave expression to the growing misgivings as to the possible misuse of the enormous powers conferred on the Speaker under the statute. By the terms of it, he is made the sole judge whether a bill is a money bill or not, and his certificate is not to be questioned in any court of law Now the power to tax is, or may be, in the words of Chief Justice Marshall, "the power to destroy" and a Socialist party could, easily enough, confiscate altogether, by a 100% estate duty, the capital of all deceased persons altogether or, equally, by a 100% income-tax duty on all incomes over a certain figure, introduce a considerable measure of "Socialism in our time" Such measures might be introduced as "money bills" in form, although their real object was not to raise revenue but to "nationalize" private capital without compensation. The rise of the Labour Party, since the Parliament Act was enacted, and its avowedly Socialistic aims had thus invested the Parliament Act with new significance, and Socialist publicists, as also the Trade Union Council at the General Election of 1924, have made no secret of the fact that they regard the office of the Speaker, and his omnipotent function of certifying under a Parliament Act any bill he pleases as a money bill and of thereby securing its immediate passage into law, as a "key position" to be "captured" if and when the party finds itself in a majority. In other countries, notably in Australia and the United States, the legislature has deliberately sought to pass industrial legislation in the form of "a money bill" by imposing a penal tax on all manufacturers who do not comply with its provisions In those countries a check is imposed on such abuse of legislative powers by the fact that they have a federal and "written" constitution, with the resulting power of the courts to declare such legislation *ultra vires*. No such check exists in this country, which might thus, under the Parliament Act, find itself exposed to almost instantaneous legislation, the motive of which, nominally fiscal, was in reality the revolution of the economic constitution of society. Hence the proposal of Lord Cave, following mainly the suggestion of the Bryce Committee, that this absolute power should be taken out of the hands of the Speaker and vested in a Joint Standing Committee of both Houses which, in "certifying" a bill as a money bill, shall have regard "not only to the form but to the substance and effect of the Bill" (*Hansard:* "Lords Debates," vol 67, No. 42, p. 779).

Up to the present moment political exigencies have not operated to put the Parliament Act in practice except on two occasions Only two measures, the Home Rule Bill and the Welsh Church Disestablishment Bill, have been forced through under its operation. In both cases their actual enforcement was suspended by a special statute during the war, while the rebellion in Ireland made an end of the Home Rule Act altogether. Moreover the Speaker, hitherto a member of one or other of the "constitutional" parties in the House, has exercised his despotic power of "certification" of money bills quite impartially and in complete independence of political considerations. He has always refused to lend any assistance to the Government party by declining to intimate beforehand what his ultimate opinion of the character of their bills would be (41 *Hansard:* "Commons Debates," 5 p. 2667) and his decisions afford little or no guide in the way of precedent. He has ruled that a bill originating in a Committee of the whole House on the recommendation of the Crown is not necessarily a money bill while, on one occasion, he has ruled that a bill not so originating is. A return, issued to the House of Commons in 1927, showed that no less than eight finance bills had been refused his certificate, although, needless to say, the House of Lords did not, having regard to the general character of these bills, avail itself of its powers to reject or amend them. The potentialities of the Parliament Act, as an instrument in the hands of a Government determined to secure revolution by "constitutional methods" in a single session of Parliament, will only become apparent if and when a Socialist Government is not only in office but in power

It had always been the practice of the Revenue authorities to collect "annual taxes," *e.g.*, customs duties and the income-tax, from the moment the "Budget resolutions" were passed in Committee of Ways and Means without waiting for the enactment of the Finance Bill which gave those resolutions retrospective sanction—the interval between the resolutions, passed in April, and the Finance Act being usually about four months. In the famous case of *Bowles* v. *the Bank of England* [1913], 1 Ch. 57, the plaintiff obtained a declaration and injunction restraining the Bank from deducting income-tax from his dividends in the interval in question In order to prevent vexatious litigation of this kind and to give what had become, until that case, an unchallenged custom the force of law, the Act of 1913 known as the Provisional Collection of Taxes Act was passed giving temporary statutory authority to the collection of any taxes voted under the Resolutions. The Act is chiefly important for the very stringent conditions it imposes on the necessity of the consent of the House to the Ways and Means Resolutions being given within a very narrow limit of time (10) days and being embodied in a second reading of the resulting bill (20 days after the consent to the resolution). Furthermore it limits the statutory force of the resolution to 4 months and provides that the resolution shall, in any case, cease to have effect immediately if Parliament is prorogued or dissolved.

The only other developments of note as regards legislative procedure during the last 18 years are some slight changes in the Standing Orders in the allocation of Parliamentary time to "private members" and the establishment of an Estimates Committee. Neither has done much, if anything, to diminish the growing ascendancy of the Cabinet over Parliament, an ascendancy which the late Sir William Anson regarded as finally consummated by the Parliament Act by which, in his view, "legislative sovereignty may be said to have passed to the Cabinet" But, even more decisive in this direction than the Parliament Act was the grant by His Majesty of the exercise of the prerogative of dissolution in 1924 to a Prime Minister, Ramsay MacDonald, who was actually in a minority in the Commons Earlier, in January of the same year, Asquith had questioned the right of a Prime Minister, so situated, to obtain a dissolution, but constitutional precedent, notably Lord Aberdeen's advisory opinion to Queen Victoria of May 15, 1858, was against Asquith's view and the grant of the dissolution of 1924 may be said definitely to establish the existence, in the hands of the Prime Minister, of this coercive power over the Commons Asquith himself had gone a long way in the direction of the assumption of this prerogative by the Prime Minister when, on November 15th, 1910, he not only "advised" His Majesty to dissolve Parliament but accompanied his advice with a request, which was granted, that the King should pledge himself beforehand to exercise the prerogative of creation of a sufficient number of peers to carry the Parliament Bill into law in the event of the Liberal party being returned to power (*Hansard*: "Commons Debates," Aug. 7, 1911.) The institution of the Estimates Committee in 1922 was due to the growing restiveness of members at the inadequate time (20 days) available in supply for the discussion of the vast and growing expenditure now submitted to the House by the Government. But the concession was jealously limited by the terms of reference to the Committee, as approved by the Government, which were "to report on what economies, if any, *consistent with the policy* implied in the Estimates, may be effected

therein." The establishment of the Committee has, in fact, effected little change. The exclusion of questions of policy excludes everything except details, and, in a debate of Aug. 1, 1922, on the Estimates Committee's Report, one of its members pointed out its futility in the words "the pity is that the reports are presented *after* supply is concluded, so that their interest is of quite a post-mortem character." Even the Public Accounts Committee, useful though it is as an independent examination by the Commons of "expenditure," as distinct from estimates, is restricted in its activities by the fact that it has "no right to go into questions of policy" (*Hansard:* "Commons Debates," vol. 152, p. 888).

A remarkable development in the direction of "democracy" was effected by the institution of "Payment of Members." It had been the honourable distinction of the House of Commons, almost alone among the legislatures of the modern world, that its members gave their services voluntarily in the representation of their constituents, although it had at one time been the practice, long fallen into disuse, for the boroughs to pay their members. In 1911 the Liberal Government of the day introduced, not in the form of a special statute but by a vote on the Estimates, an appropriation of £400 to be paid to each member of the House, and their vote has ever since been a standing feature of the annual Appropriation Bill. Thereby it is made a charge not on the constituency, as in the case of the boroughs in early times, but on the national Exchequer. No conditions as to attendance at the House are annexed to the receipt of the salary. (*Cf. Holinshed* v. *Hazelton* [1916] 85 L.J. [H.L.] p. 60.)

Turning to the constitution of Parliament itself, we find vast changes, alike in the franchise, the qualification of members and the distribution of constituencies. The Representation of the People Act of 1918 enfranchised women for the first time and, in so doing and also in simplifying the qualifications of men's votes, added no less than 13 million voters to the register. It also altered and simplified the law of registration, effected a redistribution of seats, abolished the property qualification and removed the pauper disqualification. At the same time it reduced the qualification for the exercise of a vote, in the case of men of at least 21 years of age, to the simple requirement of 6 months' residence or, in the alternative, occupation of business premises, either or both of which might confer the vote, not more than 2 votes being so conferred. In removing the "lodger" qualification, with its requirement of the tenancy of rooms of the annual value of £10, and substituting mere residence as sufficient, it operated as an Act for the enfranchisement of youth, and so it has proved to be. In 1928 the franchise was further extended by the removal of the age restriction (30 years of age under the 1918 Act) upon women voters and by making them eligible for a vote at the same age as men. The inevitable corollary of the grant of the franchise to women was the removal of their disability to be elected to Parliament; this was effected by the Parliamentary Qualification of Women Act. Strangely enough they are not yet qualified, when peeresses in their own right, to take their seats in the Lords—such was the judgment of a Committee of Privileges in *Viscountess Rhondda's petition* to the Lords [1922] 2 A.C., 330, where it was held that the sex Disqualification Removal Act, admitting women to public "offices" and "functions" had not altered their disability in the matter of succession to a seat in the Lords.

The redistribution of constituencies effected by the Franchise Act of 1918 was followed in 1922 by another and more radical change in the composition of the House of Commons. The grant of Dominion status to Southern Ireland, henceforth to be known as the Irish Free State, as embodied in subsequent legislation, was inevitably accompanied by the repeal of the clauses of the Act of Union providing for the representation of Ireland, with the exception of "Ulster" or Northern Ireland, in the House of Commons and the disappearance of all executive authority of the British Cabinet in the internal affairs of Southern Ireland. (See *Ex parte O'Brien* [1923] 2 K.B. 361.)

No discussion of the subject of Parliament would be complete without some reference to the General Strike of 1926. That movement, marking a return by the Labour party to "direct action," was, in effect, a challenge to the authority of Parliament as represented, in the executive sphere, by a Government responsible to it and having its confidence. It was, on a strict view of the law, very close to that statutory definition of treason, felony which embraces any attempt to "put any force or constraint upon" or "to intimidate or overawe both Houses or either House of Parliament" although the absence of "overt acts" amounting to "levying war," in other words of acts of violence, to effect this object, might be held to have saved the movement, or rather its leaders, from such a felonious character. The defeat of the movement was directly due, in the first instance, to public opinion but, secondly, to the prompt putting into operation of the drastic powers conferred on the Executive by the Emergency Powers Act of 1920. These powers are strictly subject to the positive approval, in the form of temporary but renewable resolutions, of both Houses of Parliament. In the case of the General Strike, the authority of Parliament was thus asked for and given, and the defeat of the movement may thus be regarded as a vindication of Parliamentary authority. The sequel was the Trade Union Act of 1927, making participation in a General Strike a criminal offence.

PARLIAMENTARY LAW, as the term is ordinarily used in the United States, embodies the generally accepted rules, precedents and practices commonly employed in the government of deliberative assemblies. Its function is to maintain decorum, ascertain the will of the majority, preserve the rights of the minority and facilitate the orderly and harmonious transaction of the business of the assembly. While it had its origin in the early British parliaments from which it derives its name the modern system of general parliamentary law is, in many respects, at wide variance with the current systems of procedure of both the English Parliament and the American Congress. These legislative systems are designed for bicameral bodies, generally with paid memberships, meeting in continuous session, requiring a majority for a quorum and delegating their duties largely to committees. Their special requirements and the constantly increasing pressure of their business have produced highly complex and remarkably efficient systems peculiar to their respective bodies, but which are as a whole unsuited to the needs of the ordinary assembly. As a result there has been simultaneously developed through years of experiment and practice a simpler system of procedure adapted to the wants of deliberative assemblies generally which though variously interpreted in minor details by different writers is now in the main standardized and authoritatively established.

Organization.—Assemblies convene with the implied understanding that they will be conducted and governed in accordance with these fundamental principles. The routine ordinarily followed in the preliminary organization of an assembly includes the call to order by any of those present with a request for nominations for temporary chairman. The temporary chairman having been elected and having taken the chair, a temporary secretary is chosen and those addressing the chairman are recognized to explain and discuss the purposes of the meeting. If the assembly has convened for a single session only or is in the nature of a mass-meeting a presiding officer and recording officer will suf-

fice. If permanent organization is contemplated a committee is usually appointed to draft a Constitution and by-laws and on the adoption of its report, with or without amendments, the assembly proceeds to the election of the permanent officers thus authorized. In a permanent organization such officers commonly consist of a presiding officer known as the president, chairman, speaker or moderator; a vice-presiding officer; a recording officer, known as the secretary or clerk, who keeps the records, attends to the clerical work of the organization and in the absence of the presiding officers calls for the selection of a temporary president; a treasurer or bursar, who receives and disburses its funds; and a sergeant-at-arms, who preserves order and carries out the wishes of the assembly through the presiding officer.

It is the duty of the presiding officer to call the assembly to order at the appointed time, cause the journal or minutes of the preceding meeting to be read, call up the business of the assembly in the order provided by its rules and conduct its proceedings in accordance with parliamentary law. He is especially charged with the responsibility of ascertaining the presence of a quorum, the minimum number of members prescribed by the rules of the assembly as competent to transact business. In legislative assemblies a quorum is presumed to be present unless the question is raised, but where the by-laws of an ordinary assembly require a quorum it devolves upon the presiding officer to ascertain that a quorum is present before proceeding with business.

Motions.—The will of an assembly is determined and expressed by its action on proposals submitted for its consideration in the form of motions or resolutions offered by members recognized for that purpose. In order to make a motion a member must rise and address the chair and secure recognition. If the motion is in order and is seconded by another member it is "stated" by the presiding officer and is then subject to the action of the assembly. A second is not required in legislative assemblies but is requisite under general parliamentary law. Motions may be classified as main or principal motions, introducing a proposition; and secondary or ancillary motions, designed to affect the pending main motion or its consideration. A main motion is in order only when there is no other business before the assembly, and yields in precedence to all other questions. Secondary motions may be subdivided into subsidiary, incidental and privileged.

Subsidiary motions are applicable to other motions for the purpose of modifying the main question or affecting its consideration and disposition. They have precedence of the motion to which applied but yield to privileged and incidental motions. They take precedence among themselves in the following order: To lay on the table, for the previous question, to close or extend debate, to postpone to a day certain, to commit, recommit and refer, to amend and to postpone indefinitely.

Motion to Lay on the Table.—The motion to lay on the table is in effect a motion to suspend consideration of the question and if agreed to, also suspends consideration of all pending questions relating to the motion to which applied until such time as the assembly may determine to take it from the table for further consideration. The motion is not debatable and may not be amended, postponed, committed, divided or reconsidered.

Motion for the Previous Question.—The purpose of the motion for the previous question is to close debate peremptorily and bring the assembly to an immediate vote on the pending question. It may be ordered on a single question, a group of questions or any part of a pending question, as on an amendment. It precludes both debate and amendment and requires a majority vote only for passage. It yields to the motion to table, to the question of consideration and to privileged and incidental motions and may be reconsidered, but takes precedence of motions to postpone, amend and commit.

Motion to Close or Extend Debate.—The motion is not admitted in either house of the U.S. Congress when not sitting as committee of the whole but is in order under general parliamentary law and in so far as applicable is subject to the rules governing the previous question.

Motion to Postpone to a Day Certain.—This applies to the main motion and its pending amendments and is debatable only as to the advisability of the postponement proposed, and does not open to debate the subject matter of the motion to which applied. It is subject to amendment and reconsideration, to privileged and incidental motions, to motions for the previous question and to lay on the table but has precedence of all other subsidiary motions.

Motion to Commit, Recommit and Refer.—The motions to commit, recommit and refer are practically equivalent and provide for reference of the pending proposition to a committee. While the motion to recommit ordinarily applies to the whole subject including pending amendments, it may apply to certain features only. It may be amended as by adding instructions to the committee as to time and manner of report. Debate on the motion is limited to the question of reference and instructions. It takes precedence of motions to amend and indefinitely postpone but yields to other subsidiary motions and to all incidental and privileged motions. It may be tabled or postponed with the main question but no subsidiary motions except the motions to amend and for the previous question may be applied separately. It is subject to reconsideration at any time before the committee begins consideration of the question submitted to it but after that time the subject matter may only be reclaimed by a motion to discharge the committee.

Motion to Amend.—Changes in the text or terms of the proposition require a second and must be reduced to writing if requested by the chairman. There is no limit to the number of amendments which may be proposed and new amendments may be offered as rapidly as the pending amendment is disposed of. Amendments in the second degree, that is, amendments to amendments, are admissible but amendments in the third degree, that is amendments to amendments to amendments, are not in order. Only four amendments in the first and second degrees may be pending simultaneously, as follows: (*a*) amendment, (*b*) amendment to the amendment, (*c*) substitute for the amendment (*i.e.,* when it is desired to replace the entire pending amendment) and (*d*) amendment to the substitute. The amendment must, of course, be offered first and the substitute before the amendment to the substitute, but otherwise there is no rule governing the order in which the four amendments may be presented. They must, however, be voted on in the following order: First, amendments to the amendment; second, amendments to the substitute; third, the substitute; and last, the amendment. Debate on an amendment is in order only when the main motion is debatable, and is then limited to the proposed modification. An amendment which has been rejected may not be offered the second time in identical form, and no amendment may be proposed reversing the operation of an amendment previously adopted. Motions to amend will not be entertained unless germane or relevant to the main question, and no proposition different from that under consideration will be admitted under guise of amendment. This motion yields to all privileged, incidental and subsidiary motions except indefinite postponement. It is subject to amendment, to the operation of the previous question and to reconsideration, and when laid on the table carries with it the proposition proposed to be amended. Likewise when the main question is laid on the table, postponed or recommitted, all pending amendments accompany it. The motion to amend is not applicable to the motion to lay on the table or for the previous question, to adjourn or to suspend the rules.

Motion to Postpone Indefinitely.—The motion to postpone indefinitely provides for final adverse disposition for the session and amounts to summary rejection. It is debatable and opens to debate the question to which applied but is subject to no subsidiary motion except the motion for the previous question.

Incidental Motions.—Incidental motions include questions arising incidentally in the consideration of other questions and decided before disposition of the one to which they are incident. They have no relative rank and merely take precedence of the pending question in the consideration of which they have arisen. All are undebatable with the exception of appeal. They comprise motions to suspend the rules, withdraw motions, read papers, raise the question of consideration, questions of order and

appeal, reconsider, take up out of order, determine method of procedure, divide pending questions and questions relating to nominations.

The motion temporarily to suspend the rules may not be debated or reconsidered and is not subject to the application of any subsidiary motion. The vote required to pass the motion is ordinarily fixed by the rules of the assembly and in the absence of such provision is two-thirds of those present and voting.

Withdrawal or modification of a motion after it has been "stated" by the presiding officer is usually effected by unanimous consent but in event of objection by any member must be submitted to the assembly. Consent of the seconder is not required but if modified the seconder may withdraw the second. When applied to the main motion it includes all adhering motions, but when applied to amendments or adhering motions the main question is not affected. The reading of papers on which a vote is to be taken may be demanded by any member as a matter of right. Papers on which a vote is not required are usually read by unanimous consent but if objection is made the question must be submitted to the assembly.

The question of whether the assembly desires to take up a proposition regularly presented for its consideration may be tested by raising the question of consideration, which may be moved at any time before actual consideration commences and does not require a second. It is not in order after debate begins or after a subsidiary motion has been applied. When the question is properly raised the assembly may by a two-thirds adverse vote decline to take up any business it prefers not to consider.

Points of Order may be made while another has the floor, and when the question concerns the use of unparliamentary language the member so called to order must be seated pending disposition of the matter. The question must be raised at the time the proceeding giving rise to the objection occurs and will not be entertained after the assembly has passed to other business. If the point of order is overruled the member resumes the floor but if the objection is sustained he may proceed only by consent of the assembly. Debate on questions of order is for the information of the chair and may be closed by the presiding officer at any time. Any member may appeal from a decision by the chair and such appeal is debatable unless arising out of an undebatable question.

The motion to reconsider must be made by one who voted with the prevailing side but may be seconded by any member. It is only in order on the day or the next calendar day after the vote proposed to be reconsidered is taken. The motion is of the highest privilege and may be entered for record on the minutes while another has the floor, but can not be called up for consideration until the pending question is disposed of, when it takes precedence of all new business. If applied to a debatable question it reopens the entire subject to debate. The motion may not be amended, committed or indefinitely postponed and requires a majority vote for passage. If agreed to, the motion reopens the entire question for further action as if there had been no final decision. The motion to take up out of order is merely another form of the motion to suspend the rules and requires a two-thirds vote for enactment. It is not amendable and debate is limited to the specific question presented.

A motion to divide the question is in order where the pending question includes propositions so distinct that, one being taken away, a substantive proposition will remain. Such motions are applicable to main questions and their amendments only and no subsidiary motion except the motion to amend is admitted. The rules of the U.S. House of Representatives provide that any member may demand the division of a question as a matter of right, but under general parliamentary procedure the question must be submitted to the vote of the assembly.

Nominations do not require a second. Where the rules of an assembly fail to provide a method of nomination a motion for such provision is in order. The motion to close nominations is subject to none of the subsidiary motions save the motion to amend, and is decided by a two-thirds vote.

Privileged Motions relate to the needs and interests of the assembly and its members in matters of such urgent importance as to supersede temporarily pending business. They take precedence of all other motions and may be offered while other questions are pending. In this class of motions is the motion to fix the time to which to adjourn, to adjourn, to take a recess, raising questions of privilege and the call for the orders of the day, all of which are undebatable.

Other motions variously referred to as supplementary, miscellaneous and unclassified, are the motions to take from the table, to discharge a committee, to accept the report of a committee, to rescind, to repeal, to annul, to expunge and to permit a member to resume the floor after having been called to order for words spoken in debate.

Rules for Debate.—In order to debate a question, a member must rise and address the chair and be recognized by the presiding officer for that purpose. The presiding officer should first recognize the mover of a proposition or the member of a committee presenting a report and should endeavour to alternate recognitions between those favouring and those opposing a question. It is also customary, though not necessarily incumbent upon the chair, to permit the proponent of a proposition to close debate. A member may speak but once on the same question at the same stage of the proceedings if others desire recognition, but is entitled to speak on the main question and on each amendment as presented. Under general parliamentary procedure a member securing the floor may speak without limit and this practice still obtains in the U.S. Senate, but the House of Representatives by rule limits speakers to one hour in the House and to five minutes in the committee of the whole. Most assemblies and all legislative bodies provide a limit for debate and in conventions it is customary to adopt a rule at the opening session limiting debate to a specified number of minutes. In debate a member must confine himself to the question under consideration, must avoid personalities and must not arraign motives. Members should be silent and respectful while another has the floor and in questioning the speaker should first address the chair, who will in turn inquire if the speaker desires to yield. Where the presiding officer is a member of the assembly he has the right to debate and to participate in the proceedings but should call another to the chair before taking the floor and should not resume it again until the pending question has been decided.

Voting.—Voting may be by ballot; by division, that is a rising vote; *viva voce*, that is by acclamation, the presiding officer deciding by the volume of voices; by show of hands; by tellers, the members passing between tellers appointed from opposite sides to count them as they pass through; and by yeas and nays, the clerk calling the roll and recording each vote as given. If there is doubt as to the result of a *viva voce* vote any member may request a division and the presiding officer thereupon proceeds to take a rising vote. A member may change his vote at any time prior to announcement of the result. Only members in attendance may vote and voting by proxy is never permissible unless by operation of law. A tie vote defeats an affirmative motion. The presiding officer if a member of the assembly votes to break a tie but not to make one.

Committees.—Much of the work of assemblies and especially of legislative bodies, is transacted by committees. The committee system provides for a better division of labour and for a more detailed consideration than the assembly as a whole is ordinarily prepared to give. Committees are classified as standing committees, with fixed terms of office, rendering continuous service; and special committees serving temporarily and assigned to limited service. In the absence of a rule making other provision, committees are selected by the assembly. Frequently the chair is authorized to appoint committees. Or selection may be made by ballot, by resolution or by designation in motions of reference. If no chairman is designated the member first named acts as chairman until the committee elects a chairman. As far as applicable the rules of the assembly govern its committees. The chairman of the committee submits its report to the assembly and unless it is of elementary character is required to present it in writing. Members who do not concur in the report may submit minority views over their signatures. When called up for con-

sideration in the assembly such minority report is read in connection with the majority report unless there is objection, in which event the question of reading the minority views is submitted without debate to the vote of the assembly

The committee of the whole consists of the entire assembly acting as a general committee. In legislative assemblies it affords greater freedom of consideration, but in non-legal bodies is rarely used

Parliamentary Practice.—Use of motions to effect a purpose in the assembly or its committees when applicable may be summarized as follows: The body may protect itself against business which it does not wish to consider by invoking the motion to lay on the table, by raising the question of consideration, or by voting to postpone indefinitely. If it is desired to suppress debate, the motion to limit debate and the demand for the previous question are available Modification of a proposition may be secured through amendment or reference to a committee with or without instructions Action may be deferred by postponement to a day certain, by providing a special order or by the motion to table A question may be brought up a second time for consideration in the assembly by voting to take from the table, by reconsideration or by the motion to rescind, repeal or annul (C. CA)

PARLIAMENTARY PROCEDURE. In Great Britain the procedure of the imperial parliament—by which phrase is signified so much of the conduct of its business as is controlled by each House and is not regulated by statute—does not for the most part depend upon any established code, but is customary and, like the common law which it resembles, is based upon various decisions and precedents In the paragraphs that follow the procedure of the Imperial House of Commons is specially described but, except where otherwise stated, they may be taken as descriptive also of the procedure of the House of Lords

The earliest parliamentary journals now extant are those of the reign of King Edward VI, and an examination of them indicates that already at that time parliamentary procedure was established in its main principles As late as 1844 there were only 14 standing orders of the House of Commons and, although the number has now been increased to over 100, these orders are largely restrictive in character or deal with particular matters and would afford little help in an attempt to construct a code of procedure Recourse must therefore be had to the precedents entered in the journals, to the decisions of speakers and chairmen, sometimes recorded in the journals but more usually to be found in reports of parliamentary debates, to tradition and to the opinions of persons experienced in parliamentary proceedings From all these sources it becomes clear that parliamentary procedure, in its general form and in its details, is directed towards the reconciliation of two often conflicting objects, the progress of business and freedom of discussion

Parliament is summoned, prorogued and dissolved by the Crown, but the sittings of either House may be adjourned from time to time by order of that House, subject to the statutory right of the Crown to summon both Houses to meet, at not less than six days' notice, during such adjournment The daily sittings of each House, and the arrangement of its business, are controlled by that House Under present arrangements both Houses normally meet on Mondays, Tuesdays, Wednesdays and Thursdays, and the House of Commons meets also on Fridays, while parliament is in session In both Houses private business (*i e*, business connected with the passage of private bills) occupies the first part of the sitting, questions to ministers of the Crown concerning public affairs occupy the second part of the sitting, and public business and debate together occupy the remainder of the sitting At half-past eleven o'clock P M on Mondays, Tuesdays, Wednesdays and Thursdays, and at half-past four o'clock P M on Fridays, unless it has previously adjourned, the House of Commons stands adjourned by standing order. At four o'clock P M on Fridays the proceedings on any business then under consideration are interrupted. At eleven o'clock P M on the other four sitting days the proceedings on any business then under consideration are interrupted, unless it is exempt from the provisions of the standing order which regulates the hours of sitting. Thereafter, no opposed business may be taken, unless it is exempt from the provisions of this standing order.

Proceedings taken in pursuance of any act of parliament, or upon any bill originating in committee of ways and means, or upon the report of any committee authorizing the expenditure of public money other than the committee of supply, are exempt from the provisions of this standing order; and any other business may be so exempted by an order of the House made after notice by a minister of the Crown. After the interruption of business, or the conclusion of exempt business, any business appointed for the sitting may be taken, if unopposed: any business not disposed of before the end of the sitting stands over until the next sitting or until such other sitting as the member in charge of the business may appoint. The quorum of the House of Lords is three, and of the House of Commons 40.

The Speaker.—At the beginning of each new parliament the House of Commons elects, and submits to the Crown for its approval, a Speaker, who presides over the deliberations of the House, maintains order in its debates, decides doubtful points of order, puts questions for the decisions of the House and declares the decisions Every order or resolution of the House is based upon a question put from the chair, founded on a motion made by a member and agreed to by the House with or without amendment The Speaker has the power to decline to submit to the House a motion that obviously infringes the rules which govern its proceedings, or to put forthwith, without permitting debate thereon, a "dilatory" motion (*i e.*, a motion for the adjournment of the House or of the debate): he has the power to repress irrelevance or repetition in debate and to deal summarily with a claim for a division which, in his opinion, is unnecessarily made. he has the power to accept or to refuse to accept a motion "That the question be now put," which brings debate to a conclusion and compels the House to decide upon the matter under discussion: he has the power to maintain order in the House by calling members to order, by directing them to withdraw from the precincts of the House for the remainder of the day's sitting, or by naming them to the House. In the last case the House will immediately proceed to vote upon the question that the member so named be suspended from the service of the House The House further reserves to itself the right to deal with its members according to ancient usages, including the right of expulsion In addition to the powers already mentioned the Speaker has the power, in the case of grave disorder, to adjourn the House without question put or to suspend any sitting for a time to be named by him

LEGISLATION

Legislation by parliament, which in earlier times was founded upon petitions from the Commons, is now conducted by means of bills, which, unless they are governed by the Parliament Act, 1911, must be passed by both Houses and receive the royal assent Over what may, for the sake of convenience, be called delegated or subsidiary legislation parliament has retained to itself some control Thus measures of the National Assembly of the Church of England are only presented for royal assent after resolutions to that effect have been agreed to by both Houses; while, of the rules and orders made by departments, or statutory commissioners, some require an affirmative resolution of both Houses to make them operative and others, although they become operative at once, can be abrogated by a resolution or address of either House passed within the statutory period

Bills, which generally may originate in either House, are divided into the two classes of public and private bills. Public bills, relating to matters of public policy, are introduced directly by members of the House, and when introduced by unofficial members are commonly known as private members' bills, to distinguish them from Government bills: private bills, designed for the particular interest or benefit of any person or persons, are founded upon the petitions of the parties interested A public bill may be introduced on motion, or presented without any motion; the latter process is now usually adopted, and the bill is deemed, after its

presentation, to have been read the first time. After a bill has been introduced it is ordered to be read a second time upon some future day, and to be printed in order that its contents may be published and distributed to members. The first, second and third readings of a bill consist, not in any actual reading of words, but in the advancement by a stage in the passage of a bill. At its second reading the whole principle of the bill is at issue, to be affirmed or denied by a vote of the House. The opponents of the bill, instead of voting against the question "That the bill be now read a second time," ordinarily move that the question be amended by the omission of the word "now" and the addition at the end of the question of the words "upon this day three (*or* 'six') months" or any date beyond the probable duration of the session: the postponement of a proceeding upon a bill in this manner is regarded as the most courteous method of dismissing the bill from further consideration. The acceptance by the House of such an amendment is tantamount to the rejection of the bill and, even if the House be sitting upon the date to which the proceeding has been postponed, the bill is not further considered upon that date. It is also competent to a member to move a "reasoned" amendment to a motion for the second reading of the bill in the form of a resolution declaratory of some principle adverse to the principles, policy or provisions of the bill.

Committees.—After a bill has been read a second time it is considered by a committee of the whole House, a standing committee, or in exceptional circumstances a select committee, who go through it in detail, dealing separately with each of its clauses. If no amendment is offered to any part of a clause the chairman of the committee at once puts the question "That the clause stand part of the bill": if, however, an amendment is proposed the chairman puts the question upon the amendment. Amendments may be made in every part of the bill, whether in the preamble, the clauses or the schedules. Clauses and schedules may be omitted, and new clauses and schedules may be added. But all amendments must be coherent, consistent with the context of the bill and within the scope of the bill. When a clause has been amended the question put from the chair is "That the clause, as amended, stand part of the bill," and no other amendment to a clause can be proposed after this question has been proposed from the chair. If a new clause is offered, so long as it is not beyond the scope of the bill, inconsistent with clauses agreed to by the committee or substantially the same as a clause previously negatived by the committee, it is read the first time without question put. A question is then put for reading the clause a second time and, if this is agreed to, the clause may be amended before being added to the bill. In the House of Commons, new clauses are considered after the clauses of the bill, as printed, have been disposed of; but in the House of Lords new clauses are brought up and inserted in their proper places while the committee are going through the bill. Schedules to a bill are usually considered after the clauses of the bill, including new clauses, have been disposed of. After the clauses and schedules have been agreed to, the preamble of the bill is considered, and the bill is then reported to the House.

A bill, on being reported from a committee, is considered by the House as a whole and not clause by clause, but otherwise in much the same detail as by the committee, and thereafter passes to its third reading. If it is read the third time it is then sent to the other House and, after passing through the same stages there, is presented for royal assent.

Finance.—A characteristic feature of House of Commons procedure is the necessity for the recommendation by the Crown of any financial business, and for its consideration in committee of the whole House. When the main object of a bill is the creation of a charge upon the public revenue, a resolution, to which the royal recommendation has been signified, must be passed in committee of the whole House, and approved by the House, before the bill may be introduced. If the charge created by a bill is a subsidiary feature, resulting from the provisions it contains, a resolution sanctioning the charge must be passed by a committee of the whole House, appointed upon the recommendation of the Crown, and must be agreed to by the House, before the relevant provisions of the bill are considered in committee. In either case the financial provisions of the bill, and any amendments to the bill in committee, must be covered by the financial resolution. In the committee of supply and the committee of ways and means, which are both committees of the whole House, the financial duties of the House of Commons are mainly discharged. The committee of supply controls the public expenditure by considering the grants of money that will be required for the navy, army, air services and civil services during the current year, upon the estimates of that expenditure proposed by the ministers of the Crown. The committee of ways and means considers such taxation as is needed to meet the expenditure required for the service of the Crown, and votes the resolutions that authorize the issue out of the Consolidated Fund of the sums required to meet the grants made by the committee of supply. These latter resolutions are the preliminary stages of Consolidated Fund bills, while the resolutions imposing taxes form the basis of the Finance bill. The resolutions of the committee of supply and of ways and means are reported to the House and must be agreed to by the House. In contrast with many otherwise comparable assemblies, parliament has no executive committees. (C. L. F.)

PARMA, a town and episcopal see of Emilia, Italy, capital of the province of Parma, situated on the Parma, a tributary of the Po, 55 m. N.W. of Bologna by rail. Pop. (1921) 58,469 (town), 62,603 (commune). Parma lies in a fertile tract of the Lombard plain, within view of the Alps and sheltered by the Apennines, 170 ft. above sea-level. From south to north it is traversed by the channel of the Parma, crossed here by five bridges; and from east to west runs the line of the Via Aemilia, by which ancient Parma was connected on the one hand with *Ariminum* (Rimini), and on the other with *Placentia* (Piacenza). The old ramparts and bastions now converted into avenues make an enceinte of about 4½ m. The cathedral of the Assumption (originally S. Herculanus) (1058–74), is a Lombardo-Romanesque building in the form of a Latin cross. The west front has three rows of arches, and a central porch supported by huge red marble lions, sculptured with the rest of the façade by Giovanni Bono da Bissone in 1281. On the south side of the façade is a large Gothic brick campanile (1284–94), with the foundations of another on the north. The walls and ceiling of the fine Romanesque interior are covered with frescoes of about 1570; those of the octagonal cupola representing the Assumption of the Virgin are by Correggio. In the sacristy are fine intarsias. To the south-west of the cathedral stands the baptistery, designed by Benedetto Antelami; it was begun in 1196 and not completed till 1281.

The church of S. Giovanni Evangelista, which dates from 1510, has a façade of 1604–07. The frescoes of the cupola are by Correggio, and the arabesques on the vault of the nave by Anselmi. The Madonna della Steccata (Our Lady of the Palisade), a fine church in the form of a Greek cross (1521–39) contains the tombs and monuments of many of the Bourbon and Farnese dukes of Parma. In the Palazzo della Pilotta is a vast irregular group of buildings (16th and 17th centuries) with the academy of fine arts (1752) and the valuable picture gallery, library, and museum. The Teatro Farnese, a remarkable wooden structure erected in 1618 from Aleotti's designs, and capable of containing 4,500 persons, is also in this palace. There are other beautiful ceiling frescoes by Correggio in the former Benedictine nunnery of S. Paolo. The royal university of Parma, founded in 1601 by Ranuccio I., and reconstituted by Philip of Bourbon in 1768, has faculties in law, medicine and natural science, and possesses an observatory, and natural science collections. It had 440 students in 1925–26. A very considerable trade is carried on at Parma in grain, cattle and the dairy produce of the district, especially the cheese known as Parmesan. Railways run hence to Sarzana through the Apennines (part of the shortest route from Milan to Rome), to Piadena (for Cremona and Mantua) and Brescia, and to Suzzara.

History.—From archaeological discoveries it would appear that the ancient town was preceded by a prehistoric settlement of the bronze age, the dwellings of which rested upon piles—one, indeed, of the so-called *terremare,* which are especially frequent

in the neighbourhood of Parma. It became a Roman colony of 2,000 colonists in 183 B.C., four years after the construction of the Via Aemilia, on which it lay. A bishop of Parma is mentioned in the acts of the council of Rome of A.D. 378. It fell into the power of Alboin in 569 and became the seat of a Lombard duchy; it was still one of the wealthiest cities of Aemilia in the Lombard period. During the 11th, 12th and 13th centuries Parma had its full share of the Guelph and Ghibelline struggles, in which it mainly took the part of the former, and also carried on repeated hostilities with Borgo San Donnino and Piacenza. As a republic its government was mainly in the hands of the Rossi, Pallavicino, Correggio and Sanvitale families. In 1307 the city became a lordship for Giberto da Correggio, who laid the basis of its territorial power by conquering Reggio, Brescello and Guastalla, and was made commander-in-chief of the Guelphs by Robert of Apulia. The Correggio family never managed to keep possession of it for long, and in 1346 they sold it to the Visconti (who constructed a citadel in 1356), and from them it passed to the Sforza. Becoming subject to Pope Julius II. in 1512, Parma remained (in spite of the French occupation from 1515 to 1521) a papal possession till 1545, when Paul III. (Alexander Farnese) invested his son Pierluigi with the duchies of Parma and Piacenza. There were eight dukes of Parma of the Farnese line (*q.v.*). After the failure of the line in 1731, the duchy was chiefly in Spanish hands, though it twice passed temporarily under Austrian rule, until its conquest by the French revolutionary armies in 1796. At the congress of Vienna, Parma, Piacenza and Guastalla were assigned to Marie Louise (Napoleon's second consort). In 1860 Parma was formally incorporated with the new kingdom of Italy.

PARMENIDES OF ELEA (Velia) in Italy, Greek philosopher. According to Diogenes Laertius he was "in his prime" 504–500 B.C., and would thus seem to have been born *c.* 539. Plato indeed (*Parmenides*, 127 B) makes Socrates hear Parmenides when the latter was about sixty-five years of age, in which case he cannot have been born before 519; but in the absence of further evidence this may be regarded as one of Plato's anachronisms. At all events Parmenides was a contemporary of Heraclitus. Parmenides attached himself for a time to the aristocratic brotherhood which Pythagoras had established at Croton; and accordingly the physical part of his system is apparently Pythagorean. The theological speculations of Xenophanes, the founder of Eleaticism, unquestionably suggested to him the theory of Being and Not-Being, of the One and the Many, by which he sought to reconcile Ionian "monism," or rather "henism," with Italiote dualism.

Parmenides embodied his tenets in a short poem, called *Nature*, of which about 160 lines have been preserved in the writings of Sextus Empiricus, Simplicius and others. It is traditionally divided into three parts—the "Proem," "Truth" (τὰ πρὸς ἀλήθειαν), and "Opinion" (τὰ πρὸς δόξαν).

Proem.—In the "Proem" the poet describes his journey from darkness to light. Borne in a chariot, attended by the daughters of the sun, he reaches a temple sacred to an unnamed goddess (variously identified by the commentators with Nature, Wisdom or Themis), by whom the rest of the poem is spoken. He must learn all things, she tells him, both truth, which is certain, and human opinions; for, though in human opinions there can be no "true faith," they must be studied for what they are worth.

Truth.—There are three ways of research, and three ways only. Of these, one asserts the non-existence of the existent and the existence of the non-existent; another, pursued by "restless" persons, whose "road returns upon itself," assumes that a thing "is and is not," "is the same and not the same." These are ways of error, because they confound existence and non-existence. In contrast to them the way of truth starts from the proposition that "what is, is; what is not, is not."

The what is is uncreated, for it cannot be derived either from *Ens* or from *Non-Ens;* it is imperishable, for it cannot pass into *Non-Ens;* it is whole, indivisible, continuous, for nothing exists to break its continuity in space; it is unchangeable (for nothing exists to break its continuity in time); it is perfect, for there is nothing which it can want; it never was, nor will be, but only is; it is evenly extended in every direction, and therefore a sphere, exactly balanced; it is identical with thought (*i.e.*, it is the sole object, of thought as opposed to sensation, sensation being concerned with variety and change).

As then the what is is one, invariable and immutable, all plurality, variety and mutation belong to the what is not. Whence it follows that all things to which men attribute reality, generation and destruction, being and not-being, change of place, alteration of colour are no more than empty words.

Opinion.—It remains in "Opinion" to describe the plurality of things, not as they are, for they are not, but as they appear. In the phenomenal world there are, it has been thought (and Parmenides accepts the theory, which appears to be of Pythagorean origin), two primary elements—namely, fire, which is gentle, thin, homogeneous, and night, which is dark, thick, heavy. Of these elements (which, according to Aristotle, were, or rather were analogous to, the what is and the what is not respectively) all things consist. The foundation for a cosmology thus being laid in dualism, the poem describes the generation of "earth and sun, and moon and air that is common to all, and the milky way, and furthest Olympus, and the glowing stars"; but the scanty fragments which have survived only show that Parmenides regarded the universe as a series of concentric spheres composed of the two primary elements and of combinations of them, the whole system being directed by an unnamed goddess established at its centre. Next came a theory of animal development, followed by a psychology, which made thought (as well as sensation, which was conceived to differ from thought only in respect of its object) depend upon the excess of the one or the other of the two constituent elements, fire and night. "Such, opinion tells us, was the generation, such is the present existence, such will be the end, of those things to which men have given distinguishing names."

In the truism "the what is, is, the what is not, is not," ὂν ἔστι, μὴ ὂν οὐκ ἔστι, Parmenides breaks with the physicists of the Ionian succession. Asking themselves—What is the material universe, they had replied respectively—It is water, It is μεταξύ τι, It is air, It is fire. Thus, while their question meant What is the single element which underlies the apparent plurality of the material world? their answers, Parmenides conceived, by attributing to the selected element various and varying qualities, reintroduced the plurality which the question sought to eliminate. If we would discover that which is common to all things at all times, we must exclude, he submitted, the differences of things, whether simultaneous or successive. Hence, whereas his predecessors had confounded that which is universally existent with that which is not universally existent, he proposed to distinguish between that which is universally existent and that which is not universally existent. The fundamental truism is the epigrammatic assertion of this distinction.

In short, the single corporeal element of the Ionian physicists was, to borrow a phrase from Aristotle, a permanent οὐσία having πάθη which change; but they either neglected the πάθη or confounded them with the οὐσία. Parmenides sought to reduce the variety of nature to a single material element; but he strictly discriminated the inconstant πάθη from the constant οὐσία and, understanding by "existence" universal, invariable, immutable being, refused to attribute to the πάθη anything more than the semblance of existence. Again, whereas the Ionians, confounding the unity and the plurality of the universe, had neglected plurality, and the Pythagoreans, contenting themselves with the reduction of the variety of nature to a duality or a series of dualities, had neglected unity, Parmenides, taking a hint from Xenophanes, made the antagonistic doctrines supply one another's deficiencies.

By his recognition of an apparent plurality supplementary to the real unity, Parmenides effected the transition from the

"monism" or "henism" of the first physical succession to the "pluralism" of the second. While Empedocles and Democritus are careful to emphasize their dissent from "Truth," it is obvious that "Opinion" is the basis of their cosmologies. The doctrine of the deceitfulness of "the undiscerning eye and the echoing ear" soon established itself, though the grounds upon which Empedocles, Anaxagoras and Democritus maintained it were not those alleged by Parmenides. Indirectly, through the dialectic of his pupil and friend Zeno and otherwise, the doctrine of the inadequacy of sensation for a time threatened to put an end to philosophical and scientific speculation. But the positive influence of Parmenides's teaching was not yet exhausted. To say that the Platonism of Plato's later dialogues, the *Parmenides*, the *Philebus* and the *Timaeus*, is the philosophy of Parmenides reconstituted, may perhaps seem paradoxical in the face of the severe criticism to which Eleaticism is subjected, but the criticism was preparatory to a reconstruction. Thus may be explained the selection of an Eleatic stranger to be the chief speaker in the *Sophist*, and of Parmenides himself to take the lead in the *Parmenides*. In the former, criticism predominates over reconstruction, the Zenonian logic being turned against the Parmenides metaphysic in such a way as to show that both the one and the other need revision: *see* 241 D, 244 B *seq.*, 257 B *seq.*, 258 D. In particular, Plato taxes Parmenides with his inconsistency in attributing to the fundamental unity extension and sphericity, so that "the worshipped ὄν is after all a pitiful μὴ ὄν" (W. H. Thompson). In the *Parmenides* reconstruction predominates over criticism—the letter of Eleaticism being here represented by Zeno, its spirit, as Plato conceived it, by Parmenides. Not the least important of the results obtained in this dialogue is the discovery that, whereas the doctrine of the "one" and the "many" is suicidal and barren so long as the "solitary one" and the "indefinitely many" are absolutely separated (127 C *seq.* and 163 B *seq.*), it becomes consistent and fruitful as soon as a "definite plurality" is interpolated between them (142 B *seq.*, 157 B *seq.*, 160 B *seq.*). In short, Parmenides could not in a true sense be regarded as an idealist, but Plato recognized in him, and rightly, the precursor of idealism.

Bibliography.—The fragments have been skilfully edited by H. Diels, in *Parmenides Lehrgedicht, griechisch u. deutsch* (Berlin, 1897), with commentary; in *Poetarum philosophorum fragmenta*, with brief Latin notes, critical and interpretative (1901); and in *Die Fragmente d. Vorsokratiker* (Bd. i. [4th ed. 1922], with German translation); Diels' text is reproduced with a helpful Latin commentary in Ritter and Preller's *Hist. phil. graecae* (ed. E. Wellmann, Gotha, 1898). The philosophical system is expounded by E. Zeller, *D. Philosophie d. Griechen* (Eng. trans., 1881); by T. Gomperz, *Greek Thinkers*, vol. i. (Eng. trans., 1901); and by J. Burnet, *Early Greek Philosophy* (3rd. ed. 1920). For the cosmology, *see* A. B. Krische, *D. theologischen Lehren d. griechischen Denker* (Göttingen, 1840). On the relations of Eleaticism and Platonism, *see* W. H. Thompson, "On Plato's *Sophist*," in the *Journal of Philology*, viii.; C. Reinhardt, *Parmenides und die Geschichte der griechischen Philosophie* (Bonn, 1916). PARMENIO (*c.* 400–330 B.C.), Macedonian general in the service of Philip II. and Alexander the Great. During the reign of Philip Parmenio obtained a great victory over the Illyrians (356); he was one of the Macedonian delegates appointed to conclude peace with Athens (346), and was sent with an army to uphold Macedonian influence in Euboea (342). In 336 he was sent with Amyntas and Attalus to make preparations for the reduction of Asia. Before he left he declared for Alexander in the confusion that followed Philip's murder. In 335 Alexander recalled him, and Parmenio was his second-in-command throughout the conquest of Persia, commanding the left wing at Granicus, Issus and Gaugamela, at which last he was outmanoeuvred by Mazaeus, his formation was cut in half and he had to send to Alexander for help. When Alexander went on to Drangiana he left Parmenio behind to guard his communications in Media; on the campaign Philotas, Parmenio's son, was charged with conspiracy, tried by the army and put to death. Whatever Parmenio's loyalty, and there is some evidence that his reputation was falling with Alexander, it was impossible to leave him in charge of Alexander's communications after that. Alexander decided that his death was preferable to the risk of his defection, and sent orders, swiftly enough to outrun the news, for Parmenio to be killed (330).

PARMIGIANO (1504–1540), Italian painter. Francesco Maria Mazzola, commonly called Parmigiano, and sometimes Parmigianino, from his birthplace, Parma, was born on Jan. 11, 1504. Losing his father, who was a painter, in early childhood, he was brought up by two uncles, also painters, Michele and Pier-Ilario Mazzola. His faculty for the art developed very young, and he followed the style of Correggio, who settled at Parma in 1518. He did not, however, become an imitator of Correggio; his style in its maturity may be regarded as a fusion of Correggio with Raphael, and thus fairly original. Even at the age of 14 (Vasari says 16) he had painted a "Baptism of Christ," surprisingly mature. Before the age of 19, when he migrated to Rome, he had covered with frescoes seven chapels in the church of S. Giovanni Evangelista, Parma.

Arrived in Rome, he presented specimen pictures to the pope, Clement VII., who assigned to him the painting of the Sala de' Pontefici, the ceilings of which had been already decorated by Giovanni da Udine. He was in Rome during the sack of the city by the soldiers of Charles V. in 1527, and at this date he was engaged in painting the "Vision of St. Jerome"—the earliest known picture by him. It displays the influence of Correggio only in the figure of St. Jerome; the composition shows the overpowering but only temporary influence on him of Michelangelo. Parmigiano left Rome shortly after for Bologna. Here he painted for the nuns of St. Margaret his most celebrated altarpiece (now in the Academy of Bologna), the "Madonna and Child, with Margaret and other Saints."

In 1531 he returned to Parma, and was commissioned to execute an extensive series of frescoes in the choir of the church of S. Maria della Steccata. These were to be completed in Nov. 1532; and half-payment, 200 golden scudi, was made to him in advance. A ceiling was allotted to him, and an arch in front of the ceiling; on the arch he painted six figures—two of them in full colour and four in monochrome—Adam, Eve, some Virtues, and the famous figure (monochrome) of Moses about to shatter the tables of the law. But, after five or six years from the date of the contract, Parmigiano had barely made a good beginning with his promised work and was imprisoned in default. Promising to amend, he was released; but instead of redeeming his pledge he decamped to Casal Maggiore, in the territory of Cremona, where he died on Aug. 24, 1540, before he had completed his 37th year. He was buried in the church of the Servites called La Fontana, near Casal Maggiore.

Grace has rightly been regarded as the chief artistic endowment of Parmigiano. "Un po' di grazia del Parmigianino" (a little or, as we might say, just a spice of Parmigianino's grace) was among the ingredients which Agostino Caracci's famed sonnet desiderates for a perfect picture. The proportions of his figures are over-long for the truth of nature; one of his Madonnas, now in the Pitti, is currently named "La Madonna del collo lungo."

Parmigiano is one of the first Italians to have practised etching; there are but a few prints extant, and they are characterized by his swift and sketchy style, which also appears in his pen drawings. These prints served as material for study to Paolo Veronese and Jacopo Bassano, Primaticcio and the school of Fontainebleau and Andrea Schiavone (Meldolla).

The most admired easel-picture of Parmigiano is the "Cupid Making a Bow," painted in 1536 for Francesco Baiardi of Parma, and now in the Gallery of Vienna. Of his portrait-painting, two interesting examples are the one of Amerigo Vespucci, in the Gallery of Naples, and the painter's own portrait in the Uffizi of Florence.

See Vasari, *Vita* (edit. Milanesi) v.; Affò, *Vita di F. Mazzola* (Parma, 1784); G. Ricci, *La Galleria di Parma* (1896); L. Frohlich-Bum, *Parmigianino* (1921).

PARMOOR, CHARLES ALFRED CRIPPS, 1st Baron (1852–), English lawyer and statesman, was born on Oct. 3, 1852, and educated at Winchester and New College, Oxford. He was called to the bar in 1877, in 1890 became a Q.C. and in 1893 a bencher. He made his reputation as a great ecclesiastical lawyer. In 1895 he was appointed attorney-general to the Prince of Wales, being reappointed in 1901 and 1912. He sat in the House of Commons as Conservative M.P. for various divisions between 1895 and 1914. He is a strong High-churchman, and was appointed chancellor and vicar-general to the province of York in 1900; he was vicar-general to the province of Canterbury (1902–24). In 1914 he was specially appointed a judicial member of the Privy Council and raised to the peerage, and in 1917 he became treasurer of the Middle Temple. Lord Parmoor was a strenuous worker for peace, and took a leading part in many pacifist organizations In the Labour governments of 1924 and 1929 he was Lord President of the Council, and in 1924 represented Great Britain at the Assembly of the League of Nations

He is the author of two standard works, *Law of Compensation* (1881, 5th ed. 1905) and *Law Relating to the Church* (6th ed 1886).

PARNAHYBA or **PARNAHIBA,** a port of the State of Piauhy, Brazil, on the right bank of the Parnahyba river, 250 m. below Therezina. Pop. of the municipality (1920) 24,152. It is the commercial entrepôt of the State, and exports hides, goatskins, cotton and tobacco, chiefly through the small port of Amarração, at the mouth of the Rio Iguarassú, 11 m distant.

PARNASSIANS, a name given to a group of French poets writing between 1866 and 1876 led by two poets in their early twenties, Catulle Mendès and Xavier de Ricart, who with the help of the young publisher, Lemerre, launched the *Parnasse Contemporain* on March 2, 1866. The title was a challenge to the old romantics of the generation of Hugo and Lamartine, and an appeal to the Latin and Hellenic tradition represented by J. du Bellay, André Chénier and the living *tétrarchat,* Leconte de Lisle, Banville, Gautier and Baudelaire, whom the young men took as their patrons. The first series ran to 18 weekly numbers and included poems by 37 writers, the majority unknown or little known to the public. Among them were poets so diverse in temperament as Coppée, Sully Prudhomme, Mallarmé and Verlaine A second series, projected in 1869 but interrupted by the war, appeared in 1871; the third and last in 1876. Impassibility was the movement's catch-word; its object was in general the plastic presentation of themes admitting romantic freedom and colour but excluding romantic sensibility and Byronic egoism; its method, a refined choice and manipulation of phrase, rhythm and stanza.

The spirit of Parnassianism, or the formula "Art for art's sake" and the *mot juste,* had its vogue outside France in the later years of the 19th century, notably in Spain where it found a fine poet in Rubén Darío, and in England where it fitted into the reaction against the ethical preoccupations of the Victorian classics, and produced in J. E. Flecker a belated but highly gifted representative of its central intention, the cultivation of a style at once clear-cut and suggestive. In France the classicizing impulse survived the departure of the symbolists and decadents and is a controlling force in poetry still.

See Catulle Mendès, *Rapport au Ministère d'instruction publique sur le développement de la poésie française* (1902), and *Le Mouvement poétique Français de 1867–1900* (1903).

PARNASSUS (mod *Liákoura* or *Likeri*), a mountain of Greece, 8,070 ft., in the south of Phocis, rising N. of Delphi. Parnassus was one of the most holy mountains in classical Greece, hallowed by the worship of Apollo, of the Muses, and of the Corycian nymphs Its chief peaks are Tithorea and Lycoreia. Two projecting cliffs, named the Phaedriadae, frame the gorge in which the Castalian spring flows out, and to the W. of this, on a shelf above the ravine of the Pleistus, is the site of the Pythian shrine of Apollo and the Delphic oracle. The Corycian cave is on the plateau between Delphi (*q.v.*) and the summit.

PARNASSUS PLAYS, a series of three scholastic entertainments performed at St. John's College, Cambridge, between 1597 and 1603. They are satirical in character and aim at setting forth the wretched state of scholars and the small respect paid to learning by the world at large, as exemplified in the adventures of two university men, Philomusus and Studioso. The first part, *The Pilgrimage to Parnassus,* describes allegorically their four years' journey to Parnassus, *i.e.,* their progress through the university course. The sequel *The Return from Parnassus,* which deals with the adventures of the two students after the completion of their studies at the university, and shows them discovering by bitter experience of how little pecuniary value their learning is

A further sequel, *The Second Part of the Return from Parnassus, or the Scourge of Simony,* is a more ambitious, and from every point of view more interesting, production than the two earlier pieces. In it on pretence of discussing a recently published collection of extracts from contemporary poetry, John Bodenham's *Belvedere,* one of the characters sums up a number of writers of the day, among them being Spenser, Constable, Drayton, John Davies, Marlowe, Jonson, Shakespeare and Nashe.

Their author is unknown, but the plays have generally been regarded as the work of a single writer—possibly John Day or one William Dodd (*see* full discussion in Ward's *Eng Dram. Lit.* ii. 640, note 2). The three pieces were evidently performed at Christmas of different years, and allusions to contemporary matters show that the first cannot have been earlier than 1598 nor the last later than 1602.

Bibliography.—The only part of the trilogy which was in print at an early date was *2 Return,* called simply *The Return from Parnassus, or the Scourge of Simony* (1606), two editions bearing the same date. This has been several times reprinted, the best separate edition being that of Professor Arber in the "English Scholars' Library" (1879) Manuscript copies of all three plays were found among T. Hearne's papers in the Bodleian by the Rev. W. D. Macray and were printed by him in 1886 (the last from one of the editions of 1606, collated with the ms). Prof Moore Smith in his article in *Mod. Lang Rev* x 162–170 gives a number of corrections of Macray's text All questions connected with the play have been elaborately discussed by Dr. W. Luhr in a dissertation entitled *Die drei cambridger Spiele vom Parnass* (Kiel, 1900). (R. B. McK.)

PARNELL, CHARLES STEWART (1846–1891), Irish Nationalist leader, was born at Avondale, Co Wicklow, on June 27, 1846, the son of John Henry Parnell and Delia Tudor, daughter of Commodore Charles Stewart of the U S navy The Parnell family came from Congleton, Cheshire, and counted various distinguished persons among its members. Thomas Parnell, who migrated to Ireland after the Restoration, had two sons, Thomas Parnell the poet and John Parnell, an Irish judge From the latter Charles Stewart Parnell was descended Sir John Parnell, chancellor of the exchequer in Grattan's parliament, and one of O'Connell's lieutenants in the parliament of the United Kingdom, was the grandson of Parnell the judge The estate of Avondale was bequeathed by him to his youngest son, William, grandfather of Charles Stewart Parnell. His second son was Sir Henry Parnell (Baron Congleton), who held office under Grey and Melbourne, and died by his own hand in 1842 Charles Stewart Parnell was much influenced by his mother, who inherited a hatred of England from her father. He was, however, of English extraction, a landowner and a Protestant Educated at private schools in England and at Magdalene College, Cambridge, his temperament and demeanour were singularly un-Irish on the surface—reserved, cold, repellent and unemotional As a schoolboy he was fond of cricket and devoted to mathematics, but had little taste for other studies or other games. He was subject to somnambulism, liable to severe fits of depression, and invincibly superstitious. He was as little at home in an English school or an English university as he was afterwards in the House of Commons. "These English," he said to his brother at school, "despise us because we are Irish, but we must stand up to them That's the way to treat an Englishman—stand up to him "

Parnell took no interest in politics in his early years, but he was deeply moved by stories related to him by servants and peasants of certain revolting cruelties perpetrated by English landlords in the not distant past. He was passionately stirred by the execution of the "Manchester Martyrs" in 1867, but did not yet think seriously of politics, though his sister Fanny was already writing patriotic verse. In the meanwhile he paid a lengthened visit to the United States. At the general election of 1874 he

desired to stand for the county of Wicklow, of which he was high sheriff at the time. The lord-lieutenant declined to relieve him of his disqualifying office, and his brother John stood in his place, but was unsuccessful at the poll. Shortly afterwards a by-election occurred in Dublin, and Parnell stood as a supporter of Isaac Butt, but was beaten He was elected for Meath in 1875.

Butt had scrupulously respected the traditions and courtesy of debate, and disapproved of the obstructive tactics invented by certain members of the Conservative party in opposition to the first Gladstone Administration. Parnell entered parliament as a virtual rebel who knew that physical force was of no avail, but believed that political exasperation might attain the desired results. He resolved to make obstruction in parliament do the work of outrage (he hated outrage and cruelty) in the country, to set the church-bell ringing—to borrow Mr. Gladstone's metaphor—and to keep it ringing in season and out of season in the ears of the House of Commons He would not condemn outrages to gratify English members of parliament. He accepted the alliance of the physical force party. He invented and encouraged "boycotting" as a substitute for outrage In the course of the negotiations in 1882, which resulted in what was known as the Kilmainham Treaty, he wrote to Captain O'Shea: "If the arrears question be settled upon the lines indicated by us, I have every confidence that the exertions we should be able to make strenuously and unremittingly would be effective in stopping outrages and intimidation of all kinds."

In 1877 Parnell entered on an organized course of obstruction He and Joseph Biggar were gradually joined by a small band of the more advanced Home Rulers, and occasionally assisted up to a certain point by one or two English members Butt was deposed William Shaw, a "transient and embarrassed phantom," was elected in his place, but Parnell became the real leader of a Nationalist party. After the general election of 1880 the more moderate section of the Nationalist party ceased to exist. Obstruction in Parnell's hands was a calculated policy, the initial stage of a campaign designed to show the malcontents in Ireland and the Fenian Brotherhood in America that strictly correct parliamentary methods were useless, but that the parliamentary machine could be so handled as to secure Irish legislative independence. The Fenians were hard to convince, but in the autumn of 1877 Parnell persuaded the Home Rule Confederation of Great Britain to depose Butt from its presidency and to elect himself in his place. Parnell's opportunity came with the general election of 1880, which displaced the Conservative government of Lord Beaconsfield and restored Mr Gladstone to power. Parnell would have no alliance with either English party. He would support each in turn with a sole regard to the balance of political power in parliament and a fixed determination to hold it in his own hands if he could. From the time that he became its leader the Home Rule party sat together in the House of Commons and always on the Opposition side. From the first Parnell imposed on the parliamentary party an iron discipline. It was there to obey orders and to vote straight Members, if required, were to speak at indefinite length, to carry out feats of endurance at all-night sittings; to paralyse parliament under the directions of Parnell, who had the eye of genius for the proper action in any emergency.

In the autumn of 1879 Parnell, after some hesitation, had given his sanction to the Land League founded by Michael Davitt. He then crossed to the United States. There the "new departure" —the alliance of the open and the secret organizations—was confirmed and consolidated Parnell obtained the countenance and support of the Clan-na-Gael, a revolutionary organization of the American-Irish, and the Land League began to absorb all the more violent spirits in Ireland, though the Fenian Brotherhood still held officially aloof from it. As soon as the general election of 1880 was announced Parnell returned to Ireland in order to direct the campaign in person. Though he had supported the Liberals at the election, he soon found himself in conflict with the Gladstone government, represented in Ireland by Earl Cowper and W. E. Forster. Parliament was summoned at an early date, and a Coercion Bill for one year, practically suspending the Habeas Corpus Act and allowing the arrest of suspects at the discretion of the government, was introduced, to be followed shortly by Harcourt's Arms Bill. Parnell regarded the measure as a declaration of war. It was doggedly obstructed at every stage, and on one occasion the debate was only brought to a close, after lasting for forty-one hours, by the Speaker's claiming to interpret the general sense of the house and resolving to put the question without further discussion. The rules of procedure were then drastically amended, and as soon as the bill was passed Mr. Gladstone introduced a new Land Bill, which occupied the greater part of the session. Parnell accepted it with many reserves. The Land League at his instigation determined to "test" the act by advising tenants in general to refrain from taking their cases into court until certain cases selected by the Land League had been decided. The government treated this policy as a deliberate attempt to wreck the working of the act On this and other grounds—notably the attitude of the League and its leaders towards crime and outrage—Parnell was arrested under the Coercion Act and lodged in Kilmainham gaol (Oct 17, 1881).

Parnell in prison at once became more powerful than he had ever been outside. Moreover imprisonment gave him rest which his nervous temperament badly needed Several of his leading colleagues followed him into Kilmainham, and the Land League was dissolved, its treasurer, Patrick Egan, escaping to Paris and carrying with him its books and accounts Before it was formally suppressed the League had issued a manifesto, signed by Parnell and several of his fellow-prisoners, calling upon the tenants to pay no rents until the government had restored the constitutional rights of the people. Discouraged by the priests, the No-Rent manifesto had little effect, but it embittered the struggle and exasperated temper on both sides of the Irish Channel.

A *modus vivendi* was desired on both sides. Negotiations set on foot through the agency of Captain O'Shea—at that time and afterwards a close agent of Parnell—resulted in what was known as the Kilmainham Treaty. Parnell and two of his friends were to be released at once, the understanding being, as Gladstone stated in a letter to Cowper, "that Parnell and his friends are ready to abandon 'No Rent' formally, and to declare against outrage energetically, intimidation included, if and when the government announce a satisfactory plan for dealing with arrears" Parnell and his friends were released, and Cowper and Forster resigned.

The Phoenix Park murders (May 6, 1882) followed. (*See* IRELAND. *History.*) Parnell was prostrated by this catastrophe. In a public manifesto to the Irish people he declared that "no act has ever been perpetrated in our country, during the exciting struggle for social and political rights of the past fifty years, that has so stained the name of hospitable Ireland as this cowardly and unprovoked assassination of a friendly stranger" Privately to his own friends and to Mr Gladstone he expressed his desire to withdraw from public life A new Crimes Bill was introduced and made operative for a period of three years, and England was exasperated by a succession of dynamite outrages organized chiefly in America, which Parnell was powerless to prevent. The Phoenix Park murders did more than any other incident of his time and career to frustrate Parnell's policy.

For more than two years after the Phoenix Park murders Parnell's influence in parliament, and even in Ireland, was only intermittently and not very energetically exerted. His health was bad, his absences from the House of Commons were frequent and mysterious, and he had already formed those relations with Mrs. O'Shea which were ultimately to bring him to the divorce court. His nervous and passionate temperament found relaxation in the society of Mrs. O'Shea and in his laboratory where he carried out intricate experiments in assaying. He became a figure more remote and mysterious than ever. The Phoenix Park murderers were arrested and brought to justice early in 1883. Forster seized the opportunity to deliver a scathing indictment of Parnell in the House of Commons. In an almost contemptuous reply Parnell repudiated the charges in general terms, disavowed all sympathy with dynamite outrages, their authors and abettors, declined to plead in detail before an English tribunal, and declared that he sought only the approbation of the Irish people. The Irish people responded by a subscription known as the "Parnell Tribute,"

amounting to £37,000, presented to Parnell, partly for the liquidation of debts he was known to have contracted, but mainly in recognition of his public services. The Irish National League, a successor to the suppressed Land League, was founded in the autumn of 1882 at a meeting over which Parnell presided, but he looked on it at first with little favour.

The Crimes Act, passed in 1882, was to expire in 1885; in May notice was given for its partial renewal and the second reading was fixed for June 10. On June 8 Parnell, with thirty-nine of his followers, voted with the Opposition against the budget, and the government was defeated by 264 votes to 252. Gladstone resigned. Salisbury undertook to form a government, and Carnarvon became viceroy. Carnarvon sought an interview with Parnell, explicitly declared that he was speaking for himself alone, heard Parnell's views, expounded his own, and forthwith reported what had taken place to the prime minister. In the result the new cabinet refused to move in the direction apparently desired by Lord Carnarvon.

Parnell opened the electoral campaign with a speech in Dublin, in which he expressed the hope that "it may be possible for us to have a programme and a platform with only one plank, and that one plank National Independence." Parnell invited Gladstone in a public speech to declare his policy and to sketch the constitution he would give to Ireland subject to the limitations he had insisted on. To this Gladstone replied, "through the same confidential channel," that he could not consider the Irish demand before it had been constitutionally formulated, and that, not being in an official position, he could not usurp the functions of a government. Thereupon Parnell instructed Irish Nationalists in Great Britain to give their votes to the Tories. In these circumstances the general election was fought, and resulted in the return of 335 Liberals, four of whom were classed as "independent," 249 Conservatives and 86 followers of Parnell.

Mr. Gladstone's return to power at the head of an administration conditionally committed to Home Rule marks the culminating point of Parnell's influence on English politics and English parties. And after the defeat of the Home Rule ministry in 1886, Parnell more than once found measures, which had been contemptuously rejected when he had proposed them, ultimately adopted by the government; and the comparative tranquillity which Ireland enjoyed at the close of the 19th century may be ascribed partly to legislation inspired and recommended by himself. In 1886 Parnell introduced a comprehensive Tenants' Relief Bill. The Salisbury government would have none of it, though in the following session they adopted and carried many of its leading provisions. Its rejection was followed by renewed agitation in Ireland, in which Parnell took no part. He was ill—"dangerously ill," he said himself at the time—and some of his more hot-headed followers devised the famous "Plan of Campaign," on which he was never consulted and which never had his approval. Ireland was once more thrown into a turmoil of agitation, turbulence and crime. In the course of the spring of 1887 *The Times* had begun publishing a series of articles entitled "Parnellism and Crime," on lines following Mr. Forster's indictment of Parnell in 1883, though with much greater detail of circumstance and accusation. On April 18 appeared an article accompanied by the facsimile of a letter purporting to be signed but not written by Parnell, in which he apologized for his attitude on the Phoenix Park murders, and specially excused the murder of Mr. Burke. On the same evening, in the House of Commons, Parnell declared the letter to be a forgery. He was not believed, and the second reading of the Crimes Act followed. Later in the session Sir Charles Lewis, an Ulster member and a bitter antagonist of the Nationalists, moved that the charges made by *The Times* constituted a breach of privilege. The government met this proposal by an offer to pay the expenses of a libel action against *The Times* on behalf of the Irish members incriminated. This was refused. Gladstone proposed a select committee of inquiry into the charges, including the letter attributed to Parnell, and to this Parnell assented. But the government rejected the proposal. For the rest, Parnell maintained almost superhuman reticence.

The Parnell Commission.—F. H. O'Donnell, an ex-M.P. and former member of the Irish party, now brought an action against *The Times* for libel. His case was a weak one, and a verdict was obtained by the defendants. But in the course of the proceedings the attorney-general, counsel for *The Times,* affirmed the readiness of his clients to establish all the charges advanced, including the genuineness of the letter which Parnell had declared to be a forgery. Parnell once more invited the House of Commons to refer this particular issue—that of the letter—to a select committee. This was again refused; but after some hesitation the government resolved to appoint by act of parliament a special commission, composed of three judges of the High Court, to inquire into all the charges advanced by *The Times.* This led to what was in substance, though not perhaps in judicial form, the most remarkable state trial of the 19th century. The commission began to sit in September 1888, and issued its report in February 1890. The report of the commission was a voluminous document reporting on the whole of the questions arising out of the relation between parliamentary action and outrage; it was variously interpreted by different parties to the controversy.

The specific charges brought against Parnell personally were thus dealt with by the commissioners:—

(*a*) That at the time of the Kilmainham negotiations Mr. Parnell knew that Sheridan and Boyton had been organizing outrage, and therefore wished to use them to put down outrage.
We find that this charge has not been proved.

(*b*) That Mr. Parnell was intimate with the leading Invincibles; that he probably learned from them what they were about when he was released on *parole* in April 1882; and that he recognized the Phoenix Park murders as their handiwork.
We find that there is no foundation for this charge. We have already stated that the Invincibles were not a branch of the Land League.

(*c*) That Mr. Parnell on 23rd January 1883, by an opportune remittance, enabled F. Byrne to escape from justice to France.
We find that Mr. Parnell did not make any remittance to enable F. Byrne to escape from justice.

Pigott's Forgery.—The argument of Parnell's insincerity based on the facsimile letter alleged to have been written by Parnell condoning the Phoenix Park murders broke down altogether. It had been purchased with other documents from one Richard Pigott, who afterwards tried to blackmail Archbishop Walsh by offering, in a letter which was produced in court, to confess its forgery. Cross-examined by Charles Russell on this letter to the archbishop, Pigott broke down utterly. Before the commission sat again he fled to Madrid, and there blew his brains out. He had confessed the forgery to Labouchere in the presence of G. A. Sala, but did not stay to be cross-examined on his confession. The attorney-general withdrew the letter on behalf of *The Times,* and the commission pronounced it to be a forgery. Shortly after the letter had been withdrawn, Parnell filed an action against *The Times* for libel, claiming damages to the amount of £100,000. The action was compromised out of court by a payment of £5,000.

Practically, the damaging effect of some of the findings of the commission was neutralized by Parnell's triumphant vindication in the matter of the facsimile letter and of the darker charges levelled at him. Towards the close of 1889, before the commission had reported, but some months after the forged letter had been withdrawn, Parnell visited Hawarden to confer with Mr. Gladstone on the measure of Home Rule to be introduced by the latter should he again be restored to power. What occurred at this conference was afterwards disclosed by Parnell, but Mr. Gladstone vehemently denied the accuracy of his statements on the subject.

Divorce Case.—But Parnell's fall was at hand. In December 1889 O'Shea filed a petition for divorce on the ground of his wife's adultery with Parnell. Parnell's intimacy with Mrs. O'Shea had begun in 1881, though at what date it became a guilty one is not in evidence. O'Shea had in that year challenged him to a duel, but was pacified by the explanations of Mrs. O'Shea. It is known that O'Shea had been Parnell's confidential agent in the negotiation of the Kilmainham Treaty, and in 1885 Parnell had strained his personal authority to the utmost to secure O'Shea's return for Galway. It is not known why O'Shea suddenly took action in 1889. No defence being offered, a decree of divorce was pronounced, and in June 1891 Parnell and Mrs. O'Shea were married.

At first the Irish party determined to stand by Parnell. The decree was pronounced on Nov. 17, 1890 On the 20th a great meeting of his political friends and supporters was held in Dublin, and a resolution that in all political matters Parnell possessed the confidence of the Irish nation was carried by acclamation. But the Irish party reckoned without its English allies. At a meeting of the National Liberal Federation held at Sheffield on Nov. 21, John Morley was privately told that the Nonconformists would insist on Parnell's resignation. Parliament was to meet on the 25th. Mr. Gladstone tried to convey to Parnell privately his conviction that unless Parnell retired the cause of Home Rule was lost. But the message never reached Parnell. Gladstone then requested John Morley to see Parnell, but he could not be found. Finally, on the 24th, Gladstone wrote to Morley the famous and fatal letter, in which he declared his conviction "that, notwithstanding the splendid services rendered by Mr Parnell to his country, his continuance at the present moment in the leadership would be disastrous in the highest degree to the cause of Ireland," and that "the continuance I speak of would not only place many hearty and effective friends of the Irish cause in a position of great embarrassment, but would render my retention of the leadership of the Liberal party, based as it has been mainly upon the presentation of the Irish cause, almost a nullity" This letter was not published until after the Irish parliamentary party had met in the House of Commons and re-elected Parnell as its chairman without a dissentient voice. A few days later Parnell was requested by a majority of the party to convene a fresh meeting. It took place in Committee Room No. 15, and after several days of angry recrimination and passionate discussion, during which Parnell, who occupied the chair, scornfully refused to put to the vote a resolution for his own deposition, 45 members retired to another room and there declared his leadership at an end. The remainder, 26 in number, stood by him The party was thus divided into Parnellites and anti-Parnellites, and the schism was not healed until several years after Parnell's death.

This was practically the end of Parnell's political career in England. The scene of operations was transferred to Ireland, and there Parnell fought incessantly a bitter and a losing fight, embittered by the hostility of the Church, which had never approved of a Protestant leader The campaign ended only with his death. An attempt at reconciliation in the party was made in the spring, at what was known as "the Boulogne negotiations," where William O'Brien endeavoured to arrange an understanding; but it came to nothing. Probably Parnell was never very anxious for its success. The life he led, the agonies he endured, the labours he undertook from the beginning of 1891, travelling weekly to Ireland and intoxicating himself with the atmosphere of passionate nationalism in which he moved, would have broken down a much stronger man He who had been outwardly the most impassive of men became restless, nervous, almost distracted at times. He visited Ireland for the last time in September, and the last public meeting he attended was on the 27th of that month. The next day he sent for his friend Dr. Kenny, who found him suffering from acute rheumatism and general debility He left Ireland on the 30th, promising to return on the following Saturday week He did return on that day, but it was in his coffin He died at Brighton on Oct. 6. His remains were conveyed to Dublin, and on the following Sunday they were laid to rest in the presence of a vast assemblage of the Irish people in Glasnevin Cemetery, not far from the grave of O'Connell

The principal materials for a biography of Parnell and the history of the Parnellite movement are to be found in *Hansard's Parliamentary Debates* (1875–91); in the *Annual Register* for the same period; in the *Report of the Special Commission* issued in 1890; in *The Life of Charles Stewart Parnell*, by R. Barry O'Brien; in *The Parnellite Movement*, by T. P O'Connor, M P.; and in a copious biography of Parnell contributed by an anonymous but well-informed writer to the *Dict of Nat. Biog.*, vol xlii. *See* also Mrs. C S. Parnell, *Charles Stewart Parnell; his love story and political life* (2 vols., 1914); J. H. Parnell, *Charles Stewart Parnell* (1916); M. M. O'Hara, *Chief and Tribune; Parnell and Davitt* (1919); St. John G. Ervine, *Parnell* (1925, pop. ed. 1928); A. F. Robbins, *Parnell: the last five years* (1926). (J. R. Th.; X.)

PARNELL, THOMAS (1679–1718), Anglo-Irish poet, born in Dublin, was educated at Trinity college, Cambridge, and in 1700 took his M.A. degree, being ordained deacon in the same year. In 1704 he became minor canon of St. Patrick's cathedral and in 1706 archdeacon of Clogher. In 1713 he was one of the contributors to the *Poetical Miscellanies* edited for Tonson by Steele, and published his *Essay on the Different Styles of Poetry*. He was a member of the Scriblerus Club, and he wrote the "Essay on the Life and Writings and Learning of Homer" prefixed to Pope's translations. In 1716 Parnell was presented to the vicarage of Finglass, when he resigned his archdeaconry. In the same year he published *Homer's Battle of the Frogs and Mice. With the remarks of Zoilus. To which is prefixed, the Life of the said Zoilus.* Parnell died at Chester, where he was buried on the 24th of October, 1718 Parnell's best known poem is "The Hermit."

In 1770 *Poems on Several Occasions* was printed with a life of the author by Oliver Goldsmith. His *Poetical Works* were printed in Anderson's and other collections of the *British Poets*. See *The Poetical Works* (1894) ed. by George A. Aitken for the *Aldine Edition of the British Poets*. His correspondence with Pope is published in Pope's *Works* (ed. Elwin and Courthorpe, vii. 451–467).

PÄRNU, a seaport and watering place of Estonia in 58° 23′ N, 24° 30′ E., on the left bank of the Pärnu river, ½ m. above its entrance into Pärnu Bay, the northern arm of the Gulf of Riga. Pop. (1926), 21,000 There are two government and three private quays, with good anchorage for large vessels, a railway on the quays, extensive warehouses and an icebreaker working from November to April. The imports are salt, herrings, coal, manure and cork wood and the exports flax, timber and woodpulp

Founded on the right side of the river in 1255 by one of the bishops of Saare Maa, Pärnu was in the 16th century occupied in succession by the Swedes, the Poles and the Teutonic Knights After 1599 the Poles transferred the town to the left side of the river; and in 1642 the Swedes, who had been in possession since 1617, strengthened it with regular fortifications In 1710 it was taken by the Russians, and in 1918 was included in Estonia

PAROCHIAL SCHOOLS. In the United States a parochial school is a private elementary school maintained by a Roman Catholic parish Elementary schools conducted by the Roman Catholic Church are generally known in the United States by this name to distinguish them from public schools supported by taxation.

Parochial schools in the United States date from the early 17th century, the first schools having been founded at that time in Florida and New Mexico Prior to 1776, 70 Roman Catholic schools existed within the present confines of the United States The increased immigration, especially from Germany and Ireland, and the consequent expansion of the church after 1840 were the principal factors making for the development of the Roman Catholic school system. The Third Plenary Council of Baltimore (1885) made it obligatory for every parish to maintain a school From 1880 to 1920 the attendance at Roman Catholic schools increased from 405,234 to 1,795,673, the percentage of total increase for the 40 year period being 343·12%

Parochial schools are supported financially by each parish, but form a diocesan system administered by a diocesan superintendent who is subject immediately to the bishop or to the diocesan board of education. Each school has a principal and a supervisor belonging, as a rule, to the religious community. The curriculum of the parish school has practically the same content as that of the public elementary school, to which is added religious education in its many phases The number of hours and the length of the term are the same as in the public school. The text-books used are those ordered by law, or in use in the public school, or texts especially designed for Roman Catholic schools.

The majority of elementary school teachers in parish schools are men and women members of a religious community or order These teachers are required to undergo a professional preparation, in the main the same as that required of public school teachers In order to prepare these teachers, various Roman Catholic universities maintain departments of education. A great number of religious communities have established their own training schools. Teachers' institutes, summer courses and summer school work are offered to teachers in service. Wherever necessary, the teach-

ers obtain State certificates; in other cases they are certified by the Diocesan Board of Education. Over 75% of the teachers in parochial schools are above the age of 25.

The 1926 statistics for Roman Catholic parochial schools are as follows: schools, 7,449; teachers, 55,155 (religious, 50,931; lay, 4,224); attendance, 2,111,560.

PARODOS, the open space or passage at either side of a Greek theatre, between the stage with its subsidiary buildings and the curved cavea or place for the audience; also an ode sung by the chorus at its entrance, which was always made through the parodos.

PARODY, in the strict meaning of the word, implies a comic imitation of a serious poem (παρῳδία is "a song sung beside"). To ridicule the grandiose is a primary impulse, not confined to any one form of art, or indeed to art at all. It is of this stuff that satire is made, but poetic parody, partly through the accidents of history, has acquired a small literature of its own The Greek epic, the Greek drama, amongst a people quick-witted and politically-minded, were especially liable to this kind of critical assault. Thus, though the true father of parody may well have been the neighbour of the first man who sang, Aristotle is able to attribute the origin of parody as a definite art to Hegemon of Thasos, whose imitation of *The Battle of the Giants* appears to have consoled the Athenians for the disasters of their expeditionary force in Sicily

We have, however, other examples of early Greek parody. There is a fragment of several hundred lines still extant, by Matron, in which the dishes of an Athenian banquet are introduced in the epic style of Homer, and the *Batrachomyomachia*, or *Battle of the Frogs and Mice,* a travesty once ascribed to Homer himself, is certainly far older than Hegemon of Thasos, or Hipponax of Ephesus, another claimant to the title of first parodist Hipponax, a man himself embittered by the rude caricatures of sculptors, wrote a parody of the *Iliad*, of which the four opening lines have been preserved by Athenaeus But the Greek parodist *par excellence* is Aristophanes, who imitates Aeschylus and, with greater gusto, Euripides. His attack upon the latter poet in *The Acharnians* embraces all that is possible in the realm of parody, being a brilliant burlesque not only on mannerisms but on spirit and modes of thought There is no exact parody so penetrating and acute, or rather, none that has been preserved, until we come down to comparatively modern times

It should be remembered, however, that rigid forms of metre and an eagerly sophisticated period of letters are the forcing-ground for the parodist, while burlesque and satire flourish abundantly, especially in light drama, on every kind of soil Roman literature produces the satires of Persius, which contain interludes of parody, some of which are supposed to have been modelled on the verses of Nero Mediaeval romance is mocked in Cervantes' *Don Quixote,* but the verbal felicities here are plainly not so important as the great conception of the satire as a whole. Scarron's *Vergile Travesti,* written about the middle of the 17th century, was borrowed from the Italian Lalli's *Aeneid Travestita*, and part of it was translated into English by Charles Cotton This poem is a coarse burlesque, and not in the true sense parody. In England Shakespeare mimicked Marlowe, and was himself parodied by Marston, who wrote a travesty of *Venus and Adonis.* John Philips, who composed *The Splendid Shilling,* a burlesque of *Paradise Lost,* is described on his monument in Westminster Abbey as a "second Milton" But the epithet, even if humorously intended, is flattering in the extreme.

The English Parodists.—The golden age of English parody may be said to begin with Isaac Hawkins Brown, who wrote very passable imitations of Pope, Thomson and Young. Thenceforward English parody flows in a direct stream, and the popularity of the exercise amongst scholars and wits in this country is in all probability due to the practice of setting compositions after the manner of classical poets as a task for pupils in public schools. It is an easy step from compulsory imitations of the Greek dramatists, of Virgil, Horace and Ovid, to critical imitations of contemporary verse. The *Rejected Addresses* of Horace and James Smith, written as dedicatory odes on the occasion of the re-opening of Drury Lane theatre in 1812, are models of excellent parody, and are even said to have caused no annoyance to the poets on whose work they were based. This is a severe criterion. The authors of the *Bon Gaultier Ballads* created an imaginary contest for the poet laureateship, an office at that time rendered vacant by the death of Southey, and this fashion was followed with great skill by Sir Owen Seaman (during the interregnum between Lord Tennyson and Sir Alfred Austin), in *The Battle of the Bays* C. S. Calverley and J. K Stephen, the former aided not a little by the mediocre quality of the muses finding favour with mid-Victorian readers, wrote parodies which can scarcely be surpassed. Since the triumph of the novel as a form of literary self-expression there have been many amusing imitations of prose romance, notably by Bret Harte, Max Beerbohm and Stephen Leacock, the American parodists, however, paying far more attention to matter than to form

It should be noted that parody, if it is to be worth while, must be criticism It is not by virtue of its self-imposed limitations absolved from the duty of showing some fair cause for ridicule But the target aimed at by the parodist is not always the poet whose dress he wears Satire of current manners, politics, or morals may be conveyed by using parody as a vehicle more powerful and more authoritative than the author's unassisted pen In such cases of borrowed thunder the original author is obviously receiving the tribute of flattery either to his greatness, or to his popularity, or to both Where, however, imitation involves also criticism of the model imitated, adoration is less easily combined with mirth, and there are those who find all parodies of well-loved poets painful to read, if not blasphemous

As an example of parody pressed to its extreme limit as a direct form of literary criticism, the following lines may be quoted:—

Two voices are there: one is of the deep;
It learns the storm-cloud's thunderous melody,
Now roars, now murmurs with the changing sea,
Now bird-like pipes, now closes soft in sleep
And one is of an old half-witted sheep
Which bleats articulate monotony,
And indicates that two and one are three,
That grass is green, lakes damp and mountains steep;
And, Wordsworth, both are thine. at certain times
Forth from the heart of thy melodious rhymes,
The form and pressure of high thoughts will burst:
At other times—Good Lord! I'd rather be
Quite unacquainted with the A B C
Than write such hopeless rubbish as thy worst

This mock sonnet by J K. Stephen will be seen to embody a very general, if rather too sweeping, estimate of the poetry of Wordsworth, whilst copying alike the nobler and the less exalted mannerisms of that poet, turn by turn; yet it preserves throughout these variations the authentic cadence of the sonnet form, serenely undisturbed

Parody then, if well executed, has this merit, that it pours criticism swiftly into an unforgettable mould But much that is written in the name of parody is either on the one hand clownish mimicry, or, on the other, of no more value than a school exercise neatly performed by an assiduous student. It may be added that several famous English poets have parodied their own poetry as a *tour de force*. But they have not done it well. (E V K.)

PAROS or **PARO,** an island in the Aegean sea, 37° N lat. and 25° 10′ E. long., one of the largest of the Cyclades, with a population of 7,725 It lies to the west of Naxos, from which it is separated by a channel about 6 m. broad Its greatest length from north-east to south-west is 13 m., and its greatest breadth 10 miles. It is formed of a single mountain about 2,500 ft high, sloping evenly down on all sides to a maritime plain, which is broadest on the north-east and south-west sides. The island is composed of marble, though gneiss and mica-schist are to be found in a few places. The capital, Paroekia or Parikia (Italian, *Parechia*), on a bay on the north-west of the island, occupies

the site of the ancient capital. Its harbour admits small vessels; but the entrance is dangerous.

By the sea is a mediaeval castle built almost entirely of ancient remains. Similar traces of antiquity are numerous in the town, and on a terrace to the south is a precinct of Asclepius. Outside the town is the church of Katapoliani (Ἡ Ἑκατονταπυλιανή) "of the hundred gates," said to have been founded by the empress Helena; one of the two adjoining churches is of very early form, and there is a baptistry with a cruciform font.

On the north side of the island is the bay of Naoussa (Naussa) or Agoussa, a safe roomy harbour; in ancient times closed by a chain or boom. Another good harbour is that of Drios on the south-east, where the Turkish fleet used to anchor on its annual voyage through the Aegean. The three villages of Tragoulas, Marmora and Kepidi (pronounced Tschipidi), in an open plain on the eastern side of the island, rich in remains of antiquity, probably occupy the site of an ancient town.

Parian marble, white and semi-transparent, with coarse grain and beautiful texture, was the chief source of wealth to the island. The quarries lie on the northern side of Mt. Marpessa (afterwards Capresso). The marble, exported from the 6th century B.C., and used by Praxiteles and other sculptors, came from subterranean quarries driven horizontally or descending into the rock; being won by lamplight it had the name Lychnites, Lychneus (from *lychnos,* a lamp), or Lygdos (Plin. *H. N.* xxxvi. 5, 14; Plato, *Eryxias,* 400 D; Athen. v. 2050; Diod. Sic. 2, 52). Several of these tunnels are still to be seen. At the entrance to one of them is a bas-relief dedicated to Pan and the Nymphs. Attempts to work the marble have been made in modern times.

History.—In tradition Paros was colonized with Arcadians by Paros of Parrhasia. From Athens came Ionians later. Parian colonies were sent to Thasos and Parium on the Hellespont. In the former, founded in the 15th or 18th Olympiad, the poet Archilochus, native of Paros, is said to have taken part. As late as 385 B.C. the Parians, in conjunction with Dionysius of Syracuse, founded a colony on the Illyrian island of Pharos. In the 6th century Parians were invited by Miletus to reform its constitution. Shortly before the Persian War Paros seems to have been a dependency of Naxos. In the Persian War Paros joined the Persians and sent a trireme to Marathon. In retaliation, its city was besieged by an Athenian fleet under Miltiades, who demanded a fine of 100 talents. But the town offered a vigorous resistance, and the Athenians were obliged to withdraw. Paros also sided with Xerxes against Greece, but after the battle of Artemisium its contingent remained in Cythnos. For this unpatriotic conduct Themistocles exacted a heavy fine (Herod. viii. 112). In the Delian League Paros paid the highest tribute of all the islands—30 talents. Little is known of the constitution of Paros. In 410 B.C. the Athenian general Theramenes found an oligarchy at Paros and restored the democracy (Diod. Sic. xiii. 47). Paros joined the Athenian confederacy of 378 B.C., but withdrew about 357 B.C. along with Chios. Later, the island lost political importance, passing with other Cycladic islands to the Ptolemies of Egypt, and thence to Roman rule. When the Latins made themselves masters of Constantinople, Paros, like the rest, became subject to Venice. In 1537 it was conquered by the Turks. It now belongs to Greece and forms a province with Naxos.

Among the most interesting discoveries made in the island is the Parian Chronicle (*q.v.*).

PARR, CATHERINE (1512–1548), the sixth queen of Henry VIII., was a daughter of Sir Thomas Parr (d. 1517). of Kendal, an official of the royal household. When only a girl she was married to Edward Borough, and after his death in or before 1529 to John Neville, Lord Latimer, who died in 1542 or 1543. Latimer had only been dead a few months when, on the 12th of July 1543, Catherine was married to Henry VIII. at Hampton Court. The new queen, who was regent of England during the king's absence in 1544, acted in a very kindly fashion towards her stepchildren; but her patience with the king did not prevent a charge of heresy from being brought against her. Henry, however, would not permit her arrest, and she became a widow for the third time on his death in January 1547. In the same year she married a former lover, Sir Thomas Seymour, now Lord Seymour of Sudeley. Soon after this event, on the 7th of September 1548, she died at Sudeley castle. Catherine was a pious and charitable woman and a friend of learning; she wrote *The Lamentation or Complaint of a Sinner*, which was published after her death.

PARR, THOMAS (*c.* 1483–1635), English centenarian, known as "Old Parr," is reputed to have been born in 1483, at Winnington, Shropshire. When 130 years old he is said to have threshed corn. In 1635 his fame reached Thomas Howard, 2nd earl of Arundel, who had him conveyed to London. Here he was presented to King Charles I., but the change of air and diet soon affected him, and the old man died at Lord Arundel's house in London, on Nov. 14, 1635. He was buried in the south transept of Westminster Abbey where the inscription over his grave reads: "Tho: Parr of ye county of Salopp Born in Ao 1483. He lived in ye reignes of Ten Princes viz. K. Edw. 4, K. Ed. V. K. Rich. 3. K. Hen. 7. K. Hen. 8. K. Edw. 6. Q. Ma. Q. Eliz. K. Ja. and K. Charles, aged 152 yeares and was buried here Nov. 15. 1635."

PARR, the name given to young fish of the salmon family, which have a series of dark bars along the side of the body, termed parr marks. They generally lose the parr marks and migrate to the sea when about 6 in. long, but parr up to 10 in. are not uncommon. (*See* SALMON and SALMONIDAE.)

PARRAMATTA: *see* SYDNEY.

PARRATT, SIR WALTER (1841–1924), English organist, was born at Huddersfield on Feb. 10, 1841. He was educated privately, and displayed his musical aptitude at a very early age. He is said, indeed, to have played the whole of Bach's 48 preludes and fugues, by heart, at the age of ten. In 1872 he became organist of Magdalen college, Oxford, and in 1882 organist of St. George's chapel, Windsor. From 1908–18 he was professor of music at Oxford, and from 1916–20, dean of the faculty of music in London university. He was knighted in 1892. He died at Windsor on March 27, 1924.

PARRHASIUS, of Ephesus, one of the greatest painters of Greece. He settled in Athens, and may be ranked among the Attic artists. He was certainly distinguished as a painter before 399 B.C. He is said to have been interested in the study of proportion. Many of his drawings on wood and parchment were preserved and highly valued by later painters for purposes of study. His picture of Theseus adorned the Capitol in Rome. His other works are chiefly mythological groups. A picture of the Demos, the personified People of Athens, is famous.

PARROT, the name of a large group of birds, which for centuries have attracted attention by their gaudy plumage and by the readiness with which many of them learn to repeat all kinds of sounds, including words and phrases of human speech. It must not be thought that this implies anything more than a mimetic power, or that the bird understands what it is saying. The parrots form the family *Psittacidae* of the order *Psittaci.* This order includes also the cuckoos and honey-eaters (qq.v.).

Although the majority of parrots are tropical, the Carolina parakeet (*Conurus carolinensis*) at the beginning of last century ranged as high as the shores of lakes Erie and Ontario, while *C. patagonus* reaches the Straits of Magellan. Two genera are peculiar to New Zealand. The region containing the greatest number of parrots in proportion to its area is that covered by the islands from Celebes to the Solomon group (Wallace, *Geogr. Distr. of Animals*). The species with the widest range is the ring-necked parakeet (*Palaeonis torquatus*), which extends from the mouth of the Gambia across Africa to the Red Sea, throughout

India, Ceylon and Burmah to Tenasserim. Parrots are gregarious and monogamous. The sexes are usually alike in appearance. The flight is low and undulating but powerful. The food is largely vegetable and is held in the claws—a unique feature. The voice is usually harsh. Parrots lay their eggs in holes in trees and rocks, or on the ground, and the eggs are white, from one to twelve forming the clutch. Perhaps the best talker is the African grey parrot (*Psittacus erithacus*), which has a red tail.

See also MACAW; COCKATOO; KEA; LORY; NESTOR; LOVE-BIRD; KAKAPO; BIRD.

PARROT-FISHES, more correctly PARROT-WRASSES, marine fishes of the family *Scaridae* closely allied to the wrasses or *Labridae*. The principal genera are *Scarus, Pseudoscarus, Odan* and *Sparisama*. They have large scales, nine spines and ten rays in the dorsal fin and two spines with eight rays in the anal, and a singular dentition. The teeth of the jaws are soldered together, and form a sharp-edged beak similar to that of a parrot; the upper and lower beak are divided into two lateral halves by a median suture. By this sharp and hard beak parrot-fishes are enabled to bite off those parts of coral-stocks which contain the polyps or to cut off branches of fucus. The process of triturating the food is performed by the pharyngeal teeth, which likewise are united, and form plates with broad masticatory surfaces. Of these plates there is one pair above, opposed to and fitting into the single one which is coalesced to the lower pharyngeal bone. Nearly one hundred species of parrot-fishes are known from the tropical and sub-tropical parts of the Indo-Pacific and Atlantic oceans; like other coral-feeding fishes, they are absent on the tropical west coasts of America and Africa. Beautiful colours prevail in this group of wrasses, but are subject to great variations in the same species. The majority of parrot-fishes are eatable. Many attain to 3ft. in length.

THE RED PARROT-FISH

PARRY, SIR CHARLES HUBERT HASTINGS, 1ST BART. cr. 1903, English musical composer (1848–1918), second son of Thomas Gambier Parry, of Highnam Court, Gloucester, was born at Bournemouth on Feb. 27, 1848. He was educated at Malvern, Twyford, near Winchester, Eton (from 1861), and Exeter College, Oxford. While still at Eton he wrote music, two anthems being published in 1865. He studied music successively with H. H. Pierson (at Stuttgart), Sterndale Bennett and Macfarren; but the most important part of his artistic development was due to Edward Dannreuther. Among the larger works of this early period may be mentioned an overture, *Guillem de Cabestanh* (Crystal Palace, 1879); a pianoforte concerto in F sharp minor, played by Dannreuther at the Crystal Palace and Richter concerts in 1880; his first choral work, *Scenes from Prometheus Unbound,* produced at the Gloucester Festival, 1880; and a symphony in G given at the Birmingham Festival in 1882. A setting of Shirley's ode, *The Glories of our Blood and State,* brought out at Gloucester, in 1883, attracted general attention and laid the foundation of his reputation. After this with a noble eight-part setting of Milton's *Blest Pair of Sirens* (Bach Choir, 1887) began a fine series of compositions set to sacred or semi-sacred words. These include *Judith* (Birmingham, 1888), *Ode on St. Cecilia's Day* (Leeds, 1889), *L'Allegro ed il penseroso* (Norwich, 1890), *De Profundis* (Hereford, 1891), *The Lotus Eaters* (Cambridge, 1892), *Job* (Gloucester, 1892), *King Saul* (Birmingham, 1894), *Invocation to Music* (Leeds, 1895), *Magnificat* (Hereford, 1897), *A Song of Darkness and of Light* (Gloucester, 1898), and a *Te Deum* (Hereford, 1900). In his *Symphonic Variations* (1897), he displayed his power as an instrumental composer, while his incidental music to *The Birds* of Aristophanes (Cambridge, 1883) and *The Frogs* (Oxford, 1892) afforded opportunity for the display of that abounding sense of humour which was such an essential part of his genial and engaging disposition. He also wrote much admirable chamber music and many beautiful songs and part songs including a setting of Blake's "Milton" which under the title "Jerusalem" has become universally known and loved.

Parry's writings include: the popular *Studies of Great Composers, The Evolution of the Art of Music* (1896), a volume (*The Seventeenth Century*) of the *Oxford History of Music, Johann Sebastian Bach* (1909) and *Style in Musical Art* (1911). At the opening of the Royal College of Music in 1883 he was appointed professor of composition and of musical history, and in 1894, on the retirement of Sir George Grove, Parry succeeded him as principal. He was appointed Choragus of Oxford University in 1883, succeeding Stainer in the musical professorship of the university in 1900. Parry retired from his professorship in 1908 and died at Rustington, Sussex, on Oct. 7, 1918.

See C. L. Graves, *Hubert Parry* (2 vols., 1926).

PARRY, SIR WILLIAM EDWARD (1790–1855), English rear-admiral and Arctic explorer, was born in Bath on Dec. 19, 1790, the son of a doctor. At the age of 13 he joined the flagship of Admiral Cornwallis in the Channel fleet as a first-class volunteer, in 1806 became a midshipman, and in 1810 became lieutenant in the "Alexander" frigate, which was employed for the next three years in the protection of the Spitzbergen whale fishery. He made many astronomical observations in northern latitudes, and afterwards published the results of his studies in a small volume on *Nautical Astronomy by Night* (1816). From 1813–17 he served on the North American station. In 1818 he was given the command of the "Alexander" brig in the Arctic expedition under Captain (afterwards Sir) John Ross. This expedition returned to England without success, but in the following year Parry obtained the chief command of a new Arctic expedition, consisting of the two ships "Griper" and "Hecla." This expedition returned to England in Nov. 1820 after a successful Arctic voyage (*see* POLAR REGIONS), having accomplished more than half the journey from Greenland to Bering strait, the completion of which solved the ancient problem of a North-west Passage. A narrative of the expedition, entitled *Journal of a Voyage to discover a North-west Passage,* appeared in 1821. In May 1821 Parry set sail with the "Fury" and "Hecla" on a second expedition to discover a North-west Passage, but was compelled to return to England in Oct. 1823 without achieving his purpose. Meanwhile he had in Nov. 1821 been promoted to post rank, and shortly after his return he was appointed acting hydrographer to the navy. His *Journal of a Second Voyage,* etc., appeared in 1824.

With the same ships he undertook a third expedition on the same quest in 1824, but was again unsuccessful, and the "Fury" being wrecked, he returned home in Oct. 1825 with a double ship's company. Of this voyage he published an account in 1826. In 1827 the Admiralty sanctioned an attempt on the North Pole from the northern shores of Spitzbergen, and Parry reached 82° 45′ N. latitude. He published an account of this journey under the title of *Narrative of the Attempt to reach the North Pole,* etc. (1827). In April 1829 he was knighted. He became comptroller of the newly created department of steam machinery of the navy, retiring in 1846, when he was appointed captain-superintendent of Haslar hospital. He became a rear-admiral in 1852, and in 1853 a governor of Greenwich hospital. He died on July 8, 1855.

See *Memoirs of Rear-Admiral Sir W. E. Parry,* by his son, Rev. Edward Parry (3rd ed., 1857).

PARSEC, the unit in which distances of stars are measured, officially adopted by the International Astronomical Union in 1922. A parallax of one second of arc corresponds to a distance of one parsec. It is equal to 31 billion kilometres ($3{\cdot}1.\ 10^{13}$), 19 billion miles, or 3·3 light-years.

PARSEES or PARSIS, the followers in India of Zoroaster (Zarathustra), being the descendants of the ancient Persians who emigrated to India on the conquest of their country by the Arabs in the 8th century. They first landed at Din in Kathiawar (A.D. 76), and 19 years later moved to Sanjan on the coast of Gujarat, where the Hindu ruler received them. To this day their vernacular language is Gujarati. Their settlement in Bombay dates from 1640.

The men have light olive complexions, a fine aquiline nose, bright black eyes, a well-turned chin, heavy arched eyebrows, thick lips, and usually wear a light curling moustache. The women have small hands and feet, fair complexions, beautiful black eyes,

finely arched eyebrows, and long black hair, which they ornament with pearls and gems. They appear freely in public.

The head is covered with a turban, or a cap made of stiff material, something like the European hat, without any rim, and has an angle from the top of the forehead backwards. It would not be respectful to uncover in presence of an equal, much less of a superior. The colour is chocolate or maroon. The priests wear a white turban and are wholly dressed in white Men and women wear the sacred shirt, *sadra,* and the girdle, *kusti. See* ZOROASTER.

Sects.—The Parsees of India are divided into two sects, the Shahanshahis and the Kadmis They differ as to the correct chronological date for the computation of the era of Yazdegerd, the last king of the Sassanian dynasty, who was dethroned by the caliph Omar about A D 640. This led to the variation of a month in the celebration of the festivals The Parsees compute time from the fall of Yazdegerd. Their calendar is divided into twelve months of thirty days each; the other five days, being added for holy days, are not counted Each day is named after some particular angel of bliss, under whose special protection it is passed On feast days a division of five watches is made under the protection of five different divinities In midwinter a feast of six days is held in commemoration of the six periods of creation About March 21, the vernal equinox, a festival is held in honour of agriculture, when planting begins In the middle of April a feast is held to celebrate the creation of trees, shrubs and flowers On the fourth day of the sixth month a feast is held in honour of Sahrevar, the deity presiding over mountains and mines On the sixteenth day of the seventh month a feast is held in honour of Mithra, the deity presiding over and directing the course of the sun, and also a festival to celebrate truth and friendship On the tenth day of the eighth month a festival is held in honour of Farvardin, the deity who presides over the departed souls of men. This day is especially set apart for the performance of ceremonies for the dead The people attend on the hills where the "towers of silence" are situated, and in the *sagris* pray for the departed souls The Parsee scriptures require the last ten days of the year to be spent in doing deeds of charity

On the day of Yazdegerd, or New Year's Day, the Parsees rise early, and after having performed their prayers and ablutions don a new suit of clothes, and go to the "fire-temples," to worship the sacred fire, which is perpetually burning on the altar Unless they duly perform this ceremony they believe their souls will not be allowed to pass the bridge "Chinvad," leading to heaven. Then they visit their relations and friends, when the ceremony of *hamijur,* or joining hands, is performed, a kind of greeting by which they wish each other "a happy new year." Their relatives and friends are invited to dinner, and they spend the rest of the day in feasting and rejoicing

There are only two distinct classes among the Parsees—the priests (*dasturs,* or high priests, *mobeds,* or the middle order; and *herbads,* or the lowest order) and the people (*behadin, behdin,* or "followers of the best religion"). The priestly office is hereditary, and no one can become a priest who was not born such

The secular affairs of the Parsees are managed by an elective committee, or *panchayat,* composed of six *dasturs* and twelve *mobeds,* making a council of eighteen

Their religion teaches them benevolence as the first principle, and they practise it with liberality The sagacity, activity and commercial enterprise of the Parsees are proverbial

See Menant, *Les Parsis* (1898), Dosabhai Framji Karaka, *History of the Parsees* (1884), Seervai and Patel, *Gujarat Parsees from the Earliest Times* (Bombay, 1898); *Tribes and Castes of Bombay* (1922).

PARSLEY, a hardy biennial herb known botanically as *Petroselinum sativum* (family Umbelliferae), the leaves of which are much used for garnishing and flavouring. It occurs as a garden escape in waste places in Britain and it is doubtful if it is known anywhere as a truly wild plant; A. de Candolle, however (*Origin of Cultivated Plants*) considers it to be wild in the Mediterranean region. It grows best in a partially shaded position, in good soil of considerable depth and not too light; a thick dressing of manure should be given before sowing For a continuous supply three sowings should be made, as early in February as the weather permits, in April or early in May and in July—the last for the winter supply in a sheltered position with southern exposure. Sow thinly in drills from 12 to 15 in. apart and about 1 in. deep; thin out to 3 in. and finally to 6 in. each.

PARSNIP, botanically known as *Pastinaca sativa,* a member of the family Umbelliferae, found wild in roadsides and waste places in England and throughout Europe and temperate Asia, and as an introduced plant in North America. It has been cultivated since the time of the Romans for the sake of its long fleshy whitish root, which has a peculiar but agreeable flavour. The wild form, with a tough, pungent, somewhat poisonous root, has become extensively naturalized in North America, especially in the Eastern States and Canada and on the Pacific coast, sometimes becoming a troublesome weed

BY COURTESY OF THE IOWA EXPERIMENTAL STATION

PARSNIP (PASTINACA SATIVA) UMBELLED FLOWER CLUSTERS AND COMPOUND LEAF, ALSO MATURE FRUIT

PARSON, a technical term in English law for the clergyman of the parish The word is properly used only of a rector (*See* RECTOR; VICAR; BENEFICE, and TITHES)

PARSONS, ALFRED (1847–1920), English painter, was born at Beckington, Somerset, on Dec 2, 1847 He was educated privately, and in 1865 entered the General Post Office as a clerk, but adopted painting as a career two years later He was pre-eminently a painter of flowers and gardens, and was also interested in designing gardens. His picture of an orchard "When Nature Painted All Things Gay" (now in the Tate gallery, London), was purchased by the Chantry fund in 1887, and he exhibited frequently at the Royal Academy, the Grosvenor and New Gallery exhibitions He was elected A R A. in 1897, and R A in 1911 From 1914 till his death on Jan. 16, 1920, he was president of the Royal Society of Painters in Water Colours

Many of Parson's illustrations appeared in *Harper's Magazine;* while among the books he illustrated are *She Stoops to Conquer* (1887), Herrick's *Hesperides and Noble Numbers* (1882, with E A Abbey); and *The Danube, from the Black Forest to the Black Sea* (with F. D Millet, 1893) Parsons also wrote and illustrated *Notes in Japan* (1896), after a visit to that country in 1892–94

PARSONS, HON. SIR CHARLES ALGERNON (1854–), K.C B. (1911), O M (1927), British engineer, born in London, June 13, 1854, fourth son of the 3rd earl of Rosse Educated privately and at St John's college, Cambridge, he entered the Armstrong works at Elswick in 1877 In 1884, having served for a year on the experimental staff of Messrs Kitson, of Leeds, he entered into partnership with Messrs Clarke, Chapman and Co, of Gateshead On the dissolution of the partnership in 1889, Parsons, whose invention of the Parsons steam turbine was bringing him into considerable prominence, established his own works at Heaton, Newcastle-upon-Tyne, for the manufacture of steam turbines, dynamos and other electrical apparatus (*see* STEAM ENGINE *Parsons Turbines*) Besides the chairmanship of C A. Parsons and Co, he occupied important positions on the directorate of various electrical supply and engineering companies He was made F R S in 1898, was awarded the Royal Society's Rumford medal in 1902, was president of the Institute of Marine Engineers 1905–6 and of the British Association 1919–20; he has been awarded a number of medals and several honorary degrees He collected and republished in 1926 his father's papers, *The Scientific Papers of William Parsons, Third Earl of Rosse (1800–67)*

PARSONS (or PERSONS), **ROBERT** (1546–1610), English Jesuit and political agitator, son of a blacksmith, was born at Nether Stowey, Somerset, on June 24, 1546 Educated at Balliol College, Oxford, he was fellow, bursar and dean of his college, but

in 1574 he resigned or was dismissed from his fellowship and offices, for reasons which have been disputed. He went to London, and thence to Louvain, where he entered the Roman Catholic Church and spent some time in the company of Father William Good, a Jesuit. In July 1575 he entered the Jesuit Society at Rome. In 1580 he was selected, along with Edmund Campion, a former associate at Oxford, and others, to undertake a secret religious and political mission to England. The two emissaries engaged in political intrigue in England and on the Continent. In 1581 Campion was arrested, but Parsons made his escape to Rouen, whence he returned to Rome, where he continued to direct the English mission. In 1588 he went to Spain, where he remained for nine years. He founded seminaries for the training of English priests at Valladolid, Lucar, Seville, Lisbon and St. Omer. He was made rector of the English college at Rome in 1597, and died there on April 18, 1610.

Parsons was the author of over 30 polemical writings, including *A Conference about the Next Succession to the Crowne of Ingland* (1594), *Treatise of the Three Conversions of England* (1603–04, 3 parts) an answer to Foxe's *Acts and Monuments*.

PARSONS, THEOPHILUS (1750–1813), American jurist, was born in Byfield (Mass.), on Feb. 24, 1750. He graduated from Harvard college in 1769, was a schoolmaster at Falmouth (now Portland) (Me.), from 1770 to 1773, studied law, and was admitted to the bar in 1774. In 1800 he removed to Boston. He was chief justice of the supreme court of Massachusetts from 1806 until his death in Boston on Oct. 30, 1813. In politics he took an active part as one of the Federalist leaders in the State. He was a member of the Essex county convention of 1778, called to protest against the proposed State constitution, and as a member of the "Essex Junto" was probably the author of *The Essex Result,* which helped to secure the rejection of the constitution at the polls. He was a member of the State constitutional convention of 1779–80, and one of the committee of 26 which drafted the constitution; he was also a delegate to the State convention of 1788 which ratified the Federal constitution; and according to tradition was the author of the famous "Conciliatory Resolutions," or proposed amendments to the constitution, which did much to win over Samuel Adams and John Hancock to the side of ratification. His *Commentaries on the Laws of the United States* (1836) contains some of his more important legal opinions.

PARSONS, WILLIAM BARCLAY (1859–), American engineer, was born in New York city on April 15, 1859. He entered the service of the Erie railroad, but resigned to take up general practice in New York city in 1885 as consulting engineer. He became deputy chief engineer in 1891 to the rapid transit commission of New York city and was chief engineer of the commission, 1894–1904. As such he designed and supervised the construction of the first part of the subway system there. He was connected professionally with railway construction in various parts of the world, and with many hydro-electric developments. He was a member of the Isthmian Canal commission, 1904; advisory engineer to the Royal commission on London traffic, 1904; a member of the board of consulting engineers of the Panama canal, 1905; chief engineer of the Cape Cod canal, 1912–14, and chairman of the Chicago transit commission, 1916. He served during the Spanish-American War as chief of engineers, National Guard of New York, and in the World War was major and later lieutenant-colonel and colonel of the 11th U.S. Engineers attached to the B.E.F. and A.E.F. in France. After the war he was made brigadier-general of engineers and placed on the retired list.

His publications include *Turnouts* (1885); *Track* (1886); *Rapid Transit in Foreign Cities* (1895); *An American Engineer in China* (1900); *The American Engineers in France* (1920); *Robert Fulton and the Submarine* (1923).

PARSONS, WILLIAM EDWARD (1872–), American architect and city planner, was born at Akron (O.), June 9, 1872. He graduated from Yale university in 1895 and Columbia university in 1898, where he was awarded the McKim fellowship in 1899. He attended the École des Beaux Arts, Paris, and studied under Laloux. He entered the office of J. C. Howard, architect, New York city, in 1901, and was appointed consulting architect to the U.S. Government in the Philippines, 1905. He designed many buildings in the Philippines, including the Manila hotel, Philippine General hospital, the University hall, the Manila club and the Manila Normal school. He developed and directed the execution of a number of city plans for Manila, Baguio, Cebu, and other cities and instituted the conservation of the old fortifications of the city of Manila as public parks. In 1914 he returned to the United States, opening practice in Chicago in 1919 with E. H. Bennett as partner.

PARSONS, a city of Labette county, Kansas, U.S.A., near the south-east corner of the State. It is on Federal highway 73, and is served by the Frisco, the Missouri-Kansas-Texas, and electric railways. Pop. (1920), 16,028 (88% native white); estimated locally, 1928, 20,000. It is near the gas and coal-fields; building stone is quarried in the vicinity, and there are large deposits of brick shale and clay. The city has railroad shops, a reclamation plant, car and bridge-building works, creameries, cold-storage plants, packing-houses for poultry and eggs, a super-power plant and other manufacturing and distributing industries. The factories have over 1,100 employees, and an output in 1925 valued at $5,171,705. The city was founded in 1869 and chartered in 1871. It was named after Levi Parsons (1822–87) the first president of the Missouri-Kansas-Texas railroad.

PARSONS' TURBINE: *see* TURBINE, STEAM.

PARTABGARH, an Indian state in the Rajputana agency. Area, 886 sq.m.; pop. (1921) 67,110. The inhabitants are mostly Bhils and other aboriginal tribes. The chief, who has the title of Maharawat and a salute of 15 guns, belongs to the Sisodia clan of Rajputs: and the state, formerly a tributary to Indore, came under British protection in 1818. The town of Partabgarh (pop., 9,182) is connected by a metalled road (20 m.) with the station of Mandasor on the Rajputana railway.

PARTABGARH, a district of British India in the Fyzabad division of the United Provinces. The administrative headquarters are at Bela. Area, 1,443 sq.m.; pop. (1921), 855,130. The Ganges forms the south-western boundary line, while the Gumti marks the eastern boundary for a few miles. The only mineral products are salt, saltpetre and *kankar* or nodular limestone. The principal crops are rice, barley, pulse, millets, sugar-cane and poppy. There are manufactures of sugar and a little silk; and grain, oil-seeds, hemp and hides are exported.

PARTHENAY, a town of western France, capital of an arrondissement in the department of Deux-Sèvres, 27 m. N.N.E. of Niort, on the railway between that town and Saumur. Pop. (1926) 5,831. Considerable portions of the 13th century ramparts remain, including the Porte St. Jacques, a fortified gateway guarding an old bridge over the Thouet. The church of Ste. Croix, 12th century, restored in 1885, has a 15th century belfry; the church of St. Laurent has portions dating from the 11th century; Notre-Dame de la Couldre has a ruined Romanesque portal and 1 m. S.W. of the town is the ancient church (12th century) of Parthenay-le-Vieux. Parthenay is the seat of a sub-prefect. It manufactures woollen goods.

PARTHENIUS, of Nicaea in Bithynia, Greek grammarian and poet. He was taken prisoner in the Mithradatic War and carried to Rome (72 B.C.); subsequently he visited Neapolis, where he taught Virgil Greek. His Ἐρωτικὰ παθήματα contains a collection of 36 love-stories, which are valuable as affording information on the Alexandrian poets and grammarians.

See E. Martini in *Mythographi graeci*, vol. ii. (1902, in Teubner Series); poetical fragments in A. Meineke, *Analecta alexandrina* (1853).

PARTHENOGENESIS, the development of an egg-cell that has not been fertilized by a male element or sperm-cell. Thus, as Bonnet discovered in 1762, the summer generations of green-flies or aphids are all parthenogenetic, no males occurring for months. A drone-bee develops from an unfertilized egg, thus having a mother, the queen, but no father. Parthenogenesis is a secondary simplification of ordinary sexual reproduction, in which fertilization is an essential condition of development. This secondary nature of parthenogenesis is indicated (1) by its sporadic occurrence in diverse classes of organisms; (2) by its occasional occurrence along with ovum-fertilization in the same animal, as in

the queen-bee; (3) by its not uncommon alternation with typical sexual reproduction in the course of generations; (4) by the fact that there is often polar-body formation in parthenogenetically developing ova, though part of its significance is wrapped up with the occurrence of fertilization; (5) by the facts of artificial parthenogenesis (*see* FERTILIZATION).

Occurrence of Parthenogenesis in Animals.—(*a*) In three classes of animals there is a frequent exhibition of parthenogenesis, namely in rotifers, crustaceans and insects. In most rotifers parthenogenesis prevails; the males are usually relatively small and degenerate, and in some cases where insemination occurs, there is no fertilization In some types males are unknown

In Crustacea, among 3,000 specimens of the brine-shrimp *Artemia* only one male was found, and von Siebold repeatedly investigated every member of a colony of *Apus* (once over 5,000 strong) without finding a single male At other times he found 1%; in other conditions many males were present In daphnids there are three kinds of eggs—(*a*) large, thick-shelled, resistant eggs, which require fertilization and always develop into females, (*b*) small, thin-shelled eggs, which can develop without being fertilized, and then give rise to females, (*c*) eggs similar to the last, but producing males. Among the cyprids nearly related forms may show (1) a rare occurrence of males, parthenogenetic generations following one another for months; (2) a frequent presence of males, but occasional occurrence of parthenogenesis, (3) an abundance of males all the year round, and parthenogenesis unknown.

Among insects parthenogenesis occurs in many gall-flies (Cynipidae) and saw-flies (Tenthredinidae). In some of these no males have been found; and this negative evidence of parthenogenesis has been confirmed by isolating females and rearing their eggs The unfertilized eggs may develop into females only (thelyotoky), or into males only (arrhenotoky) for a limited period, or into both sexes. In aphids the parthenogenetic development of females may continue for at least four years, but no case is known where males do not eventually occur, also arising from parthenogenetic ova. Among scale-insects (Coccidae) parthenogenesis often occurs, even though males are present In most cases the male is still unknown, but this does not necessarily prove parthenogenesis, for the known males are very minute and short-lived In *Lecanium hesperidum,* the pigmy male was discovered in an ovarian cul-de-sac within the female In many gall-flies the successive generations show parthenogenetic and spermic development in regular alternation, but some species are perpetually parthenogenetic In some saw-flies the parthenogenetic ova develop into females only; in others into males only (thus implying that fertilized ova developing into females also occur); in others the progeny are of both sexes. There are stray occurrences of parthenogenesis among other insects, as in species of *Solenobia,* a wingless relative of clothes-moths Among nematode worms there are many instances of parthenogenesis.

Parthenogenesis in Plants.—Of parthenogenesis in the strict sense there are few examples among plants, for it must be distinguished from relapses into asexuality, as in many Fungi (*q v*) The development of an egg-cell without fertilization is seen in *Chara crinita,* one of the water-stoneworts, represented in Northern Europe by female plants only Parthenogenesis is the rule in the dandelion, and also occurs in some hawkweeds (*Hieracium*) and in species of *Alchemilla* and *Antennaria*, etc

Grades of Parthenogenesis.—(*a*) What may be called pathological parthenogenesis is illustrated when the ovum, of a bird for instance, exhibits without fertilization a number of cleavages, but with no further development (*b*) The term casual parthenogenesis may be used for exceptional aspermic development, as in silk-moths (*c*) The workers of ants, bees and wasps, not normally reproductive, may exhibit occasional parthenogenesis, the eggs apparently always developing into males. (*d*) The queen bee exhibits partial parthenogenesis, for it rests with her whether the deposited egg is fertilized from her store of spermatozoa, received during the nuptial flight from the inseminating drone. (*e*) The term seasonal parthenogenesis may be applied to cases like green-flies and some Entomostraca. (*f*) In a few strange cases, as in some species of the gall-midge (*Miastor*) the larval form becomes precociously reproductive, and illustrates juvenile or paedogenic parthenogenesis. The female lays a few, very large eggs, which develop into larvae. But inside these there arise other larvae which eat their way out. The same thing happens through several generations which succeed one another through autumn, winter and spring. In the following summer, however, the last set of larvae become pupae, which metamorphose into sexually perfect midges. The parthenogenetically-reproducing larvae have no ovaries, and their offspring arise from peculiar cells which occur in association with the fatty body. (*g*) This leads on to what is familiar in the life-history of the liver-fluke and related forms, where rediae arise inside the sporocyst, and cercariae within the rediae. The precociously reproductive sporocyst is a transformation of the sexually-produced free-swimming larva or miracidium, while the rediae and cercariae arise from "spore-cells," which are undoubtedly primitive germ-cells homologous with ova, but requiring no fertilization. (*h*) Such cases lead on to the sporogony common in plants, and familiar in ferns. But spore-formation is probably a persistent primitive mode of uni-parental reproduction, whereas the parthenogenetic development of ova seems in all cases to be secondary and derivative. (*i*) The series ends in total parthenogenesis—for one generation, as in many Cynipidae; for several successive generations, as in many Entomostraca; or perpetually, as in many rotifers

Chromosomes in Parthenogenetic Ova.—The animal ovum typically undergoes a process of maturation, in which, by meiotic or reducing division, the normal number of ordinary chromosomes (*q v.*) is halved (*see* CYTOLOGY) A similar reduction occurs in the maturation of the sperm-cells, and thus in fertilization the normal number will be restored (*see* SEX) Now in regard to parthenogenetic development, the broad fact is that the reduction process occurs in some types and not in others It may be noted further that parthenogenesis without reduction may be due (*a*) to the fact that only one polar-body is formed and no reducing division occurs (*Cypris reptans*); or (*b*) to the return of the polar-body nucleus to fuse with the ovum-nucleus (some individuals of *Artemia*); or (*c*) to the fact that both the maturation divisions are equational, neither meiotic (saw-fly *Nematus;* gall-wasp *Rhodites*). In a case like the dandelion, the egg-cell undergoes no reduction of chromosomes, while in *Chara crinita* the number is in the parthenogenetic strain permanently half the normal.

General.—There is no known general peculiarity characterizing those ova able to develop without fertilization. There is no necessary degeneration associated with long-continued or perpetual parthenogenesis Besides much non-inherited variability, mutations (*i e* , inherited variations) are known to occur in parthogenetically reproduced strains Although parthenogenesis may favour rapid multiplication, so that forms exhibiting it would tend to survive, and although it may be of use in species where males are few or where fertilization is difficult, it is not at present possible to find a utilitarian justification of every occurrence of this departure.

PARTHENON, the name generally given, since the 4th century B C, to the chief temple of Athena on the Acropolis at Athens (*e.g* , Demosthenes, *c Androt* 13, 76) The name is applied in the official inventories of the 5th and early 4th centuries to one compartment of the temple, and this was probably its original meaning It is certainly to be associated with the cult of Athena Parthenos, "the Virgin "

The most convenient position for a temple upon the natural rock-platform of the Acropolis was occupied by the early temple of Athena. When it was decided to supersede this by a larger and more magnificent temple, it was necessary to provide a site for this new temple by means of a great substructure, which is on its south side about 40 ft. high. This substructure was built for an earlier temple, probably dating from the 6th century B.C.

The extant temple was the chief among the buildings with

THE PARTHENON, SHOWING DETAILS AND PROPOSED RESTORATIONS

The Parthenon was begun 447 B.C. and dedicated 438 B.C. Designed by the architects Ictinus and Kallikrates, with sculpture by Phidias, it represents the culmination of the Periclean period in Greek architecture. Perhaps nowhere else in classic building were such perfection and subtlety, alike of design and execution, achieved. The columns are slightly inclined inward to give an impression of stability, and all of the horizontal lines are delicately curved, to compensate for any possible optical illusion of concavity. Originally all of the sculpture and many of the architectural features were brilliantly coloured

which Pericles adorned the Acropolis. The supervision of the whole work was in the hands of Pheidias, and the architects of the temple were Ictinus and Callicrates. The actual building was not begun until 447 B.C., though the decision to build was made ten years earlier (Keil, *Anonymus argentorensis*). The temple must have been structurally complete by the year 438 B.C., in which the gold and ivory statue of Athena Parthenos was dedicated; but the work of decoration was still going on in 433 B.C. The temple designed by Ictinus was about 15 ft. shorter and about 6 ft. wider than the building for which the foundations were intended; it thus obtained a proportion of length to breadth of exactly 9:4. It is the most perfect example of the Doric order. The plan was peculiar. The cella, which was exactly 100 ft long, kept the name and traditional measurement of the old Hecatompedon It was surrounded on three sides by a Doric colonnade, and in the middle of it was the great basis on which the statue was erected This cella was probably lighted only by the great doorway and by the light that filtered through the marble tiles The common notion that there was a hypaethral opening is erroneous At the back of the cella was a square chamber, not communicating with it, but entered from the west end of the temple; this was the Parthenon in the narrower sense. It seems to have been used only as a store-house, though it may have been originally intended for a more important purpose. The Prodomus and the Opisthodomus were enclosed by bronze gratings fixed between the columns, and were thus adapted to contain valuable offerings and other treasures We have inventories on marble of the contents of these four compartments of the temple The opisthodomus, in particular, probably served as a treasury. The metopes over the outer colonnade were all sculptured, and represented on the east the battle of gods and giants, on the west, probably, the battle of Greeks and Amazons, on the south Greeks and Centaurs; those on the north are almost lost The east pediment represented the birth of Athena, the west pediment her contest with Poseidon for the land of Attica The frieze, which was placed above the cella wall at the sides, represented the Panathenaic procession, approaching on three sides the group of gods seated in the middle of the east side These sculptures are admirably adapted to their position on the building.

The Parthenon probably remained intact until the 5th century of our era, when the colossal statue was removed, and the temple is said to have been transformed into a church dedicated to S Sophia. In the 6th century it was dedicated to the Virgin Mother of God (Θεοτόκος). The adaptation of the building as a church involved the removal of the inner columns and roof, the construction of an apse at the east end, and the opening of a door between the cella and the chamber behind it These alterations involved some damage to the sculptures In 1456 Athens was captured by the Turks, and the Parthenon was changed into a mosque, apparently without any serious structural alterations except the addition of a minaret. In this state it was described by Spon and Wheler in 1676 and the sculpture was drawn by the French artist Carrey in 1674 In 1687 the Turks used the building as a powder magazine during the bombardment of the Acropolis by a Venetian army under Morosini, and a shell caused the explosion which blew out the middle of the temple

Still further damage to the sculptures was done by Morosini's unsuccessful attempt to lower from the west pediment the chariot of Athena. Later a small mosque was constructed in the midst of the ruins; but nothing except gradual damage is to be recorded during the succeeding century except the visits of various travellers, notably of James Stuart (1713–88) and Nicholas Revett (1720–1804), whose splendid drawings are the best record of the sculpture as it existed in Athens In 1801 Lord Elgin obtained a firman authorizing him to make casts and drawings, and to pull down extant buildings where necessary, and to remove sculpture from them He caused all the remains of the sculpture that was found on the ground or in Turkish houses, and a certain amount—notably the metopes—that was still on the temple, to be transported to England The Elgin marbles were bought by the British Government in 1816, and are now in the British Museum Certain other sculptures from the Parthenon are in the Louvre. Copenhagen or elsewhere, and much is still in Athens.

The most accurate measurements of the temple, showing the exactness of its construction and the subtlety of the curvature of all its lines, were made by F. C. Penrose.

The perfection of the proportions and details of the parthenon has so impressed modern critics that many attempts, frequently fantastic, have been made to discover in it some geometric or mathematical system of related sizes that could thus furnish some infallible rule of beauty. The fact that so many different systems have been found to apply is a sufficient criticism of each of them. The most elaborate is the extremely ingenious analysis of Robert W Gardner, who claims to have discovered that all dimensions are based on sides of squares with related areas; the same system accounting not only for the Parthenon and its details, but also for its position, the placing of many monuments in Athens, the walls from Athens to Piraeus and the layout of Piraeus itself It seems, however, more probable that the situation of a good harbour and the requirements of military defense controlled these matters, rather than any esoteric mathematical system

PARTHIA, the mountainous country south-east of the Caspian sea, which extends from the Elburz chain eastwards towards Herat, and is bounded on the north by the fertile plain of Hyrcania (about Astrabad) at the foot of the mountains in the corner of the Caspian and by the Turanian desert, on the south by the great salt desert of central Iran It corresponds to the modern Khorasan. It was inhabited by an Iranian tribe, the *Parthava* of the inscriptions of Darius; the correct Greek form is Παρθυαῖοι. Parthia became a province of the Achaemenian and then of the Macedonian empire Seleucus I and Antiochus I founded Greek towns: Soteira, Charis, Achaea, Calliope (Appian, *Syr* 57; Plin vi 15; *cf.* Strabo xi 516); the capital of Parthia, the ruins of which are around the present town Damghan, is known only by its Greek name Hecatompylos ("The Hundred-gated"), from the many roads which met there (Polyb. x 28), and was, according to Appian, founded by Seleucus I. (*cf* Curtius vii. 2) In 208 many Greek inhabitants are found in the towns of Parthia and Hyrcania (Polyb x 31, 11).

When about 255 B.C. Diodotus had made himself king of Bactria (*q.v.*), and tried to expand his dominions, the chieftain of a tribe of Iranian nomads (Dahan Scyths) east of the Caspian, the Parni or Aparni, who bore the Persian name Arsaces, fled before him into Parthia.[1] Here the satrap Andragoras appears to have shaken off the Seleucid supremacy, as he struck gold and silver coins in his own name, on which he wears the diadem, although not the royal title (Gardner, *Numism. Chronicle*, 1870–81) He was slain by Arsaces (Justin xli 4), who occupied Parthia and became the founder of the Parthian kingdom (248 B.C.). The origin and early history of the Parthian kingdom, of which we possess only very scanty information, is surrounded by fabulous legends, narrated by Arrian in his *Parthica* (preserved in Photius, *cod.* 58, and Syncellus, p 539 *seq.*) Arsaces ruled for many years The troubles of the Seleucid empire, and the war of Seleucus II against Ptolemy III. and his own brother Antiochus Hierax, enabled him not only to maintain himself in Parthia, but also to conquer Hyrcania; but he was constantly threatened by Diodotus of Bactria (Justin xli. 4) When, about 238 B.C., Seleucus II was able to march into the east, Arsaces fled to the nomadic tribe of the Apasiacae (Strabo xi. 513; *cf* Polyb x. 48). But Seleucus was soon recalled by a rebellion in Syria, and when Diodotus died, Arsaces returned victorious to Parthia; "the day of this victory is celebrated by the Parthians as the beginning of their independence" (Justin xli 4) Arsaces was proclaimed king at Asaak in the district of Astauene, now Kuchan,

[1]Strabo xi. 515; *cf.* Justin xli 4; the Parni are said by Strabo (*ibid.*) to have immigrated from southern Russia, a tradition wrongly transferred to the Parthians themselves by Justin xli. 1, and Arrian *ap.* Phot. *cod* 58

in the upper Atrek (Attruck) valley (Isidor. Charac.), and built his residence Dara on a rock in a fertile valley in Apavarktikene (Justin xli. 5; Plin. vi. 46), now Kelat still farther eastward; the centre of his power evidently lay on the borders of eastern Khorasan and the Turanian desert. The principal institutions of the Parthian kingdom were created by him (*cf.* Justin xli. 2). The Scythian nomads became the ruling race; they were invested with large landed property, and formed the council of the king, who appointed the successor. They were archers fighting on horseback, and in their cavalry consisted the strength of the Parthian army; the infantry were mostly slaves, bought and trained for military service, like the janissaries and mamelukes. But these Scythians soon amalgamated with the Parthian peasants. They adopted the Iranian religion of Zoroaster, and "their language was a mixture of Scythian and Median" (*i e* , Iranian). Therefore their language and writing are called by the later Persians ("Pehlevi"), *i e.,* Parthian (Pehlevi is the modern form of Parthawa) and the magnates themselves Pehlevans; *i.e.,* "Parthians," a term transferred by Firdousi to the heroes of the old Iranian legend But the Arsacid kingdom never was a truly national State; with the Scythian and Parthian elements were united some elements of Greek civilization.

To Arsaces I. probably belong the earliest Parthian coins; the oldest simply bear the name Arsaces; others, evidently struck after the coronation in Asaak, have the royal title (βασιλέως Ἀρσάκου). The reverse shows the seated archer, or occasionally an elephant, the head of the king is beardless and wears a helmet and a diadem; only from the third or fourth king do they begin to wear a beard after the Iranian fashion

Of the successors of Arsaces I we know very little. His son, Arsaces II , was attacked by Antiochus III , the Great, in 209, who conquered the Parthian and Hyrcanian towns but at last granted a peace The next king, whom Justin calls Priapatius, ruled 15 years (about 190–175), his successor, Phraates I , subjected the mountainous tribe of the Mardi (in the Elburz). He died early, and was succeeded not by one of his sons but by his brother, Mithridates I , who became the founder of the Parthian empire. Mithridates I (*c* 170–138) had to fight hard with the Greeks of Bactria, especially with Eucratides (*q v.*); at last he was able to conquer a great part of eastern Iran. Soon after the death of Antiochus IV. Epiphanes (163) he conquered Media, where he refounded the town of Rhagae (Rai near Teheran) under the name of Arsacia, and about 141 he invaded Babylonia. He and his son Phraates II. defeated the attempts of Demetrius II (139) and Antiochus VII (129) to regain the eastern provinces, and extended the Arsacid dominion to the Euphrates

For the later history of the Parthian empire reference should be made to PERSIA· *Ancient History*, and biographical articles on the kings The following is a list of the kings, as far as it is possible to establish their succession The names of pretenders not generally acknowledged are put in brackets.—

Arsaces I. (perhaps Tiridates I)	248–*c*. 211	(Tiridates III.	36)
Arsaces II.	*c* 211–190	(Cinnamus	38)
Priapatius	*c* 190–175	(Vardanes I.	40–45)
Phraates I	*c*. 175–170	Gotarzes	40–51
Mithridates I	*c* 170–138	Vonones II.	51
Phraates II	*c* 138–127	Vologaeses I.	51–77
Artabanus I	*c* 127–124	(Vardanes II	55)
Mithridates II. the Great	*c* 124–88*	Vologaeses II.	77–79, 111–147
Sanatruces I.	76–70	Pacorus	78–*c* 105
Phraates III	70–57	(Artabanus III.	80–81)
Orodes I.	57–37	Osroes	106–129
(Mithridates III.	57–54)	(Mithridates IV and his son Sanatruces II , 115; Parthamaspates, 116–117; and other pretenders.)	
Phraates IV.	37–2	Mithridates V	*c* 129–147
(Tiridates II	32–31 and 26)	Vologaeses III	147–191
Phraates V. (Phraataces)	2 B C–A D. 5	Vologaeses IV	191–209
Orodes II.	A D. 5–7	(Vologaeses V.	209–*c*. 222)
Vonones I.	8–11	Artabanus IV	209–227
Artabanus II.	*c*. 10–40		

*The names of the following kings are not known; that one of them was called Artabanus II. is quite conjectural.

BIBLIOGRAPHY.—Persian tradition knows very little about the Arsacids, who by it are called Ashkanians (from Ashak, the modern form of Arsaces). Of modern works on the history of the Parthians (besides the numismatic literature), the most important are. G. Rawlinson, *The Sixth Oriental Monarchy* (1873), and A. von Gutschmid, *Geschichte Irans und seine Nachbarlander von Alexander d Gr bis zum Untergang der Arsaciden* (1888). The principal works on the Arsacid coinage are (after the earlier pub of Longpérier Prokesch-Ostan, etc.): Percy Gardner, *The Parthian Coinage* (1877), and esp. W Wroth, *Catalogue of the Coins of Parthia* in British Museum (1903), who revised the statements of his predecessors *Cf* also Petrowicz *Arsacidenmunzen* (Vienna, 1904), and Allotte de là Fuye, "Classement des monnaies arsacides," in *Revue numismatique*, 4 *série*, vol. viii., 1904.

(ED M)

PARTIES: *see* PRACTICE AND PROCEDURE

PARTITION, in law, the division between several persons of land or goods belonging to them as co-proprietors It was a maxim of Roman law, followed in modern systems, that *in communione vel societate nemo potest invitus detineri* Partition was either voluntary or was obtained by the *actio communi dividendo* In English law the term partition applies only to the division of lands, tenements and hereditaments, or of chattels real between coparceners, joint tenants (*q v*) or tenants in common (*q v*) Partition is either voluntary or compulsory, and has been regulated from time to time by various acts of parliament Since the Law of Property Act, 1925, it applies also to chattels (s 188). The English acts have been substantially adopted by many of the colonies

Partition is not a technical term of Scots law In Scotland all heritable or movable property in joint ownership may at the instance of any of the joint owners be brought to a division, failing consent, by an action of division, in which action failing the practicability of division, the property will be sold judicially and the price distributed among the joint owners Commonty lands in the perpetual joint use of the commoners as accessories of lands held by them on exclusive titles are also divisible by action The act of 1695, c 38, made all commonties, except those belonging to the king or royal burghs, divisible, on the application of any having interest, by action in the court of session By the Sheriff Courts (Scotland) Act 1907, s 5, the action for division of common property or commonty is competent in the sheriff court, but when the subject in dispute exceeds in value £50 by the year, or £1,000 value the action may on the motion of either party be removed into the court of session

In the United States, "it is presumed," says Chancellor Kent (4 *Comm* , lect lxiv) "that the English statutes of 31 & 32 Henry VIII have been generally re-enacted and adopted, and probably with increased facilities for partition " In a large majority of the States, partition may be made by a summary method of petition to the courts of common law In the other States the courts of equity have exclusive jurisdiction As between heirs and devisees the probate courts may in some States award partition The various State laws with regard to partition will be found in Washburn, *Real Property*

PARTNERSHIP, in general, the voluntary association of two or more persons for the purpose of gain, or sharing in the work and profits of any enterprise This general definition requires to be restricted, in law, according to the account given below

Though the English law of partnership is based upon Roman law, there are several matters in which the two systems differ (1) There was no limit to the number of partners in Roman law (2) In *societas* one partner could generally bind another only by express *mandatum*, one partner was not regarded as the implied agent of the others (3) The debts of a *societas* were apparently joint, and not joint and several (4) The *heres* of a deceased partner could not succeed to the rights of the deceased, even by express stipulation There is no such disability in England (5) In actions between partners in Roman law, the *beneficium competentiae* applied—*i.e* , the privilege of being condemned only in such an amount as the partner could pay without being reduced to destitution (6) The Roman partner was in some respects more strictly bound by his fiduciary position than is the English partner For instance, a Roman partner could not retire in order to enjoy alone a gain which he knew was awaiting him

Previous to the Partnership Act 1890 the English law of partnership was to be found only in legal decisions and in text-

books. It was mostly the result of judge-made law, and as distinguished from the law of joint stock companies was affected by comparatively few Acts of parliament.

In 1890 the Partnership Act of that year was passed to declare and amend the law of partnership; the Act came into operation on Jan. 1, 1891. With one important exception (s. 23), it applies to the whole United Kingdom. It is not a complete code of partnership law, it contains no provisions regulating the administration of partnership assets in the event of death or bankruptcy, and is silent on the subject of goodwill. The existing rules of equity and common law continue in force, except so far as they are inconsistent with the express provisions of the Act Indeed, the Act of 1890 has to be read in the light of the decisions which have built up these rules

Nature of Partnership.—Partnership is defined to be the "relation which subsists between persons carrying on a business in common with a view of profit." Co-ownership of property does not of itself create a partnership, nor does the sharing of gross returns The sharing of profits, though not of itself sufficient to create a partnership, is *prima facie* evidence of one To illustrate the rule that persons may share profits without being partners, the Act gives statutory expression to the decision in *Cox* v *Hickman* (1860, 8 H L C , 268), viz , that the receipt by a person of a debt or other fixed sum by instalments, or otherwise, out of the accruing profits of a business does not of itself make him a partner; and it re-enacts with some slight modification the repealed provisions of Bovill's Act (28 and 29 Vict c. 86), which was passed to remove certain difficulties arising from the decision in *Cox* v *Hickman* Partners are called collectively a "firm"; the name under which they carry on business is called the firm name Under English law the firm is not a corporation, nor is it recognized as distinct from the members composing it, any change amongst them destroys the identity of the firm In Scotland a firm is a legal person distinct from its members, but each partner can be compelled to pay its debt

At common law there is no limit to the number of partners, but by the Companies Act 1862 (25 and 26 Vict c 89, s 4), not more than ten persons can carry on the business of bankers, and not more than 20 any other business, unless (with some exceptions) they conform to the provisions of the Act. (*See* COMPANY, and also *Limited Partnerships* below)

Relations of Partners to Persons Dealing with Them.—Every partner is an agent of the firm and of his co-partners for the purpose of the partnership business; if a partner does an act for carrying on the partnership business in the usual way in which businesses of a like kind are carried on he thereby *prima facie* binds his firm. The partners may by agreement between themselves restrict the power of any of their number to bind the firm. If there be such an agreement, no act done in contravention of it is binding on the firm with respect to persons who have notice of the agreement Such an agreement does not affect persons who have no notice of it, unless indeed they do not know or believe the person with whom they are dealing to be a partner; in that case he has neither real, nor, so far as they are concerned, apparent authority to bind his firm, and his firm will not be bound

A firm is liable for loss or injury caused to any person not a partner, or for any penalty incurred by any wrongful act or omission of a partner acting in the ordinary course of the partnership business, or with the authority of his co-partners; the extent of the firm's liability is the same as that of the individual partner. The firm is also liable to make good the loss (*a*) where one partner, acting within his apparent authority, receives money or property of a third person and misapplies it, and (*b*) where a firm in the course of its business receives money or property of a third person, and such money or property while in the custody of the firm is misapplied by a partner. To fix the other partners with liability, notice of the breach of trust must be brought home to them individually

The liability of partners for the debts and obligations of their firms arising *ex contractu*, is joint, and in Scotland several also; the estate of a deceased partner is also severally liable in a due course of administration, but subject, in England or Ireland, to the prior payment of his separate debts. The liability of partners for the obligations of their firm arising *ex delicto*, is joint and several. A partner who retires from a firm does not thereby cease to be liable for debts or obligations incurred before his retirement.

Relations of Partners to One Another.—The mutual rights and duties of partners depend upon the agreement between them. Many of these rights and duties are stated in the Partnership Act; but, whether stated in the Act or ascertained by agreement, they may be varied by the consent of all the partners; such consent may be express or inferred from conduct. Subject to any agreement, partners share equally in the capital and profits of their business, and must contribute equally to losses, whether of capital or otherwise, they are entitled to be indemnified by their firm against liabilities incurred in the proper and ordinary conduct of the partnership business, and for anything necessarily done for its preservation; they are entitled to interest at 5% on their advances to the firm, but not on their capital Every partner may take part in the management of the partnership business, but no partner is entitled to remuneration for so doing. The majority can bind the minority in ordinary matters connected with the partnership business, but cannot change its nature nor expel a partner, unless expressly authorized so to do No partner may be introduced into the firm without the consent of all the partners The partnership books must be kept at the principal place of business, and every partner may inspect and copy them. Partners must render to each other true accounts and full information of all things affecting the partnership A partner may not make private use of anything belonging to his firm nor may he compete with it in business

Partners may agree what shall and what shall not be partnership property, and can by agreement convert partnership property into the separate property of the individual partners, and vice versa Subject to any such agreement, all property originally brought into the partnership stock, or acquired on account of the firm or for the purposes and in the course of its business, is declared by the Act to be partnership property Property bought with money of the firm is *prima facie* bought on account of the firm Partnership property must be applied exclusively for partnership purposes and in accordance with the partnership agreement. The legal estate in partnership land devolves according to the general law, but in trust for the persons interested therein

When no fixed term has been agreed upon for the duration of the partnership, it is at will, and may be determined by notice at any time by any partner If a partnership for a fixed term is continued after the term has expired without any express new agreement, the rights and duties of the partners remain as before, so far as they are consistent with a partnership at will

A partner may assign his share in the partnership either absolutely or by way of mortgage The assignee does not become a partner; during the continuance of the partnership he has the right to receive the share of profits to which his assignor would have been entitled, but he has no right to interfere in the partnership business, or to require any accounts of the partnership transactions, or to inspect the partnership books.

Since the Act came into operation no writ of execution may issue in England or Ireland against any partnership property, except on a judgment against the firm If in either of these countries a judgment creditor of a partner wishes to enforce his judgment against that partner's share in the partnership, he must obtain an order of court charging such share with payment of his debt and interest. The court may appoint a receiver of the partner's share, and may order a sale of such share

Dissolution of Partnership.—A partnership for a fixed term, or for a single adventure, is dissolved by the expiration of the term or the termination of the adventure. A partnership for an undefined time is dissolved by notice of dissolution, which may be given at any time by any partner. The death or bankruptcy of any partner dissolves the partnership as between all its members If a partner suffers his share in the partnership to be charged under the Act for his separate debts, his partners may dissolve the partnership The foregoing rules are subject to any agreement there may be between the partners. A partnership is in every case dissolved by any event which makes the partnership or its business

unlawful. The court may order a dissolution in any of the following cases, viz.: When a partner is found lunatic or is of permanently unsound mind, or otherwise permanently incapable of performing his duties as a partner; when a partner has been guilty of conduct calculated to injure the partnership business, or wilfully or persistently breaks the partnership agreement, or so conducts himself in partnership matters that it is not reasonably practicable for his partners to carry on business with him; when the partnership can only be carried on at a loss; and lastly, whenever a dissolution appears to the court to be just and equitable. A dissolution usually is not complete as against persons who are not partners, until notice of it has been given; until then such persons may treat all apparent partners as still members of the firm. Notice is not necessary to protect the estate of a dead or bankrupt partner from partnership debts contracted after his death or bankruptcy; nor is notice necessary when a person not known to be a partner leaves a firm. Notice in the *Gazette* is sufficient as regards all persons who were not previously customers of the firm; notice in fact must be given to old customers.

The Act makes no mention of goodwill, but the rights of a seller in this respect were fully discussed in the House of Lords in *Trego* v. *Hunt* (L.R. 1896, App Cas. 7). In the absence of special agreement, the seller may set up business in competition with, and in the immediate neighbourhood of, the purchaser, and advertise his business and deal with his former customers, but may not represent himself as carrying on his former business, nor canvass his former customers The purchaser may advertise himself as carrying on the former business, canvass its customers, and trade under the old name, unless that name is or contains the name of the vendor, and the purchaser by using it without qualification would expose the vendor to the liability of being sued as a partner in the business If, on a dissolution or change in the constitution of a firm, the goodwill belongs under the partnership agreement exclusively to one or more of the partners, the partner who is entitled to the goodwill has the rights of a seller. Those to whom the goodwill does not belong have the rights of a purchaser.

If a partner ceases to be a member of a firm, and his former partners continue to carry on business with the partnership assets without any final settlement of accounts, he, or, if he be dead, his estate, is, in the absence of agreement, entitled to such part of the subsequent profits as can be attributed to the use of his share of the partnership assets, or, if he or his representatives prefer it, to interest at 5% on the amount of his share If his former partners have by agreement an option to purchase his share, and exercise the option, he is not entitled to any further or other share in profits than that given him by the agreement.

Limited Partnerships.—In the law of partnership as set out above, the Limited Partnership Act 1907 introduced a considerable innovation. By that Act power was given to form limited partnerships, like the French *société en commandite*; *i.e.*, a partnership consisting not only of general partners, but of others whose liability is limited to the amount contributed to the concern. Such a limited partnership must not consist, in the case of a partnership carrying on the business of banking, of more than ten persons, and in the case of any other partnership of more than 20 persons There must be one or more persons called general partners who are liable for all the debts and obligations of the firm, and limited partners, who on entering into partnership contribute a certain sum or property valued at a stated amount, beyond which they are not liable. Limited partners cannot withdraw or receive back any of their contributions; any withdrawal brings liability for the debts and obligations of the firm up to the amount withdrawn. A body corporate may be a limited partner No limited partner can take part in the management of a partnership business; if he does so he becomes liable in the same way as a general partner, but he can at all times inspect the books of the firm and examine into the state and prospects of the business. Every limited partnership must be registered with the registrar of joint stock companies, and the statutory particulars must be given. If any change occurs in these particulars, a statement signed by the firm and specifying the nature of the change, must be sent within seven days to the registrar An advertisement must also be inserted in the *Gazette* of any arrangement by which a general partner becomes a limited partner or under which the share of a limited partner is assigned. The law of private partnership applies to limited partners except where it is inconsistent with the express provisions of the Limited Partnership Act.

See Lindley, *A Treatise on the Law of Partnership* (7th ed. 1905); Pollock, *A Digest of the Law of Partnership* (8th ed. 1905).

Scots Law.—The law of Scotland as to partnership agrees in the main with the law of England and the Act of 1890 applies. The principal difference is that Scots law recognizes the firm as distinct from the individuals composing it. The name of the company may be either personal or descriptive. A firm with a personal name may sue or be sued under that name, but a firm with a descriptive name may sue and be sued only with the addition of the names of three at least (if there are so many) of the partners A consequence of this view of the company as a separate person is that an action cannot be maintained against a partner personally without application to the company in the first instance, the individual partners being in the position of cautioners for the company rather than of principal debtors. But, though the company must first be discussed, diligence must necessarily be directed against the individual partners. Heritable property cannot be held in the name of a firm; it can only stand in the name of individual partners. Notice of the retirement of even a dormant partner is necessary The law of Scotland draws a distinction between joint adventure and partnership Joint adventure or joint trade is a partnership confined to a particular adventure or speculation, in which the partners, whether latent or unknown, use no firm or social name, and incur no responsibility beyond the limits of the adventure. In the rules applicable to cases of insolvency and bankruptcy of a company and partners, Scots law differs in several respects from English. Thus a company can be made bankrupt without the partners being made so as individuals. And, when both company and partners are bankrupt, the company creditors are entitled to rank on the separate estates of the partners for the balance of their debts equally with the separate creditors. But in sequestration, by the Bankruptcy Scotland Act 1913, s. 62, the creditor of a company, in claiming upon the sequestrated estate of a partner, must deduct from the amount of his claim the value of his right to draw payment from the company's funds, and he is ranked as creditor only for the balance. (*See* Erskine's *Inst.* bk iii tit iii ; Bell's *Comm.* ii. 500–562; Bell's *Principles*, ss. 350–403) (X.)

United States.—In the United States, though the basis of the law of partnership was the English common law, there have been significant legislative changes dealing with partnership rights and liabilities Prior to 1914 the legislation was special in character and numerous diversities were to be found in the law of the various States In that year the conference of commissioners on uniform State laws approved a draft act for a uniform partnership law which has since been adopted by the legislatures of about one-third of the States Two divergent legal theories as to the nature of the partnership had been developed by the American courts, one adhering to the old common law conception that the partnership was simply an aggregate of individuals, and the other building up the newer conception that the partnership existed as an entity distinct from the partners In the divergent problems peculiar to the United States and centring in the enforcement of a judgment obtained against a partnership in one State as against partners resident in another State, the issue between the entity and aggregate theory of a partnership has become a problem of important legal significance.

The Uniform Partnership Act, with some exceptions, is an attempt to codify the existing common law on the subject of partnership. In its major provisions it conforms with the law as found in the English Partnership Act. Like the English act its provisions must be read in the light of the earlier common law decisions The tests for establishing the existence of a partnership are essentially similar to those in the English act, though greater emphasis is laid upon the fact of the sharing of the profits of a business as being an indication that such person is a partner in the business The act lays down no limit as to the

number of persons that may comprise a partnership nor the types of business in which a partnership may engage. Such limitations may, however, be commonly found in other legislation. Partners are the agents of the partnership to carry on the partnership business but specific authority from all the partners must be had in order that a partner may bind the partnership in a limited class of transactions. Partnership liability in contract is made joint, but in tort is joint and several. Prior to the act there had been a manifest tendency in the various States to make all partnership obligations joint and several. The act restores the common law rule. Partners may be created by estoppel, as where a person gives credit to a partnership upon the representation by one who is not a partner but represents himself or consents to others representing that he is a partner. In contradistinction to the English rule a person admitted to the partnership is liable to the extent of the partnership property for any liabilities incurred before he became a member.

The relations of the partners to one another are substantially those prevailing in England. Liberal variations of these rights by mutual agreement between the partners are permitted. The fiduciary relationship between the partners is retained with full vigour. The extent of partnership property and its devolution upon the death of a partner are regulated in detail. Assignment of a partner's interest does not operate to dissolve the partnership. In the dissolution and winding up of a partnership, the act even more closely follows its English model. The causes for dissolution are identical, notification of dissolution to third parties is essential in order that the limited authority of any partner to bind the partnership shall be effectual. Special provision is made for the continuation of the partnership business with the aid of the partnership assets in cases where the dissolution is caused in contravention of the partnership agreement, those partners who have not wrongfully caused the dissolution being permitted to carry on the business.

Limited partnerships are wholly a creation of statute law, originating from the need of new commercial ventures for increased capital. In 1822 New York passed the first statute permitting their creation. It was followed by similar legislation in other States. The desire of the legislatures, however, to safeguard the interests of persons dealing with an association and relying upon the individual liabilities of the associates as well as the joint assets, led them to subject the limited partner to an unlimited liability for the slightest infraction of the statutory rules. By the Uniform Limited Partnership Act drafted in 1916 and since then enacted by almost a third of the States, the limited partner was given a greater protection. Such legislation has undoubtedly stimulated the organization of limited partnerships. To give publicity to the limitation of liability, a device of registering that fact is employed together with complete details as to the organization of the partnership The limited partner is given the character of an investor rather than a general partner and does not participate in the management of the business No limitations exist as to the character of the business that can be conducted by a limited partnership, except as other special legislation excludes this form of associate enterprise from particular enterprises.

See Burdick, *Law of Partnership* (3d ed. 1917); Warren, *Corporate Advantages without Incorporation* (1929); Magruder and Foster, "Jurisdiction over Partnerships," 27 *Harvard Law Review*, 793 (1924).

(J. M. La.)

PARTON, JAMES (1822–1891), American biographer, was born in Canterbury, England, Feb. 9, 1822. He was taken to the United States when he was five years old, studied in and near New York, and was a schoolmaster in Philadelphia and New York. He removed (1875) to Newburyport (Mass.), where he died on Oct. 17, 1891. Parton's best known books were *Life of Horace Greeley* (1855), *Life and Times of Aaron Burr* (1857), and *Life of Andrew Jackson* (1859–60) Among his other publications were: *General Butler in New Orleans* (1863), *Famous Americans of Recent Times* (1867) and *Captains of Industry* (2 ser., 1884 and 1891), for young people. His first wife Sara (1811–72), sister of N. P. Willis, attained considerable popularity as a writer under the pen-name "Fanny Fern"

PARTONOPEUS DE BLOIS, hero of romance. The French romance dates from the 13th century, and is in fact a variation of *Cupid and Psyche*. Partonopeus is represented as having lived in the days of Clovis. He was seized while hunting, and carried off to a castle, the inhabitants of which were invisible. Melior, empress of Constantinople, came to him at night, stipulating that he must not attempt to see her for two years and a half. After successful fighting against Sornegur of Denmark, he returned to the castle, armed with an enchanted lantern which broke the spell. The tale ends happily. It had a continuation giving the adventures of Fursin or Anselet, nephew of Sornegur

Bibliography.—The French romance was edited by G. A. Crapelet, with an introduction by A. C. M. Robert, as Partonopeus de Blois (2 vols., 1834); an English *Partonope of Blois*, by W. E. Buckley for the Roxburghe club (1862), and another fragment for the same society in 1873; the German *Partonopier und Melior* of Konrad von Würzburg by Bartsch (1871); the Icelandic *Partalópa saga* by Klockhoff in *Upsala Universitets Arsskrift* for 1887 *See* also H. L. Ward, *Catalogue of Romances*, i. 689, etc. (1883, 1910 etc.); E. Kölbing, *Die verschiedenen Gestaltungen der Partonopeus-Sage*, in *Germ Stud* (vol. ii, 1875), in which the Icelandic version is compared with the Danish poem *Persenober* and the Spanish prose *Historia del conde Partinobles;* E. Pfeiffer, "Über die MSS. des Part. de Blois" in Stengel's *Ausg. in Abh. phil.* (No. 25, Marburg, 1885).

PARTRIDGE, SIR BERNARD (1861–), British artist, born in London on Oct 11, 1861, was educated at Stonyhurst, and after matriculating at London University entered the office of Dunn & Hansom, architects He then joined for a couple of years a firm of stained-glass designers (Lavers, Barraud & Westlake), learning drapery and ornament; and then studied and executed church ornament under Philip Westlake, 1880–1884 He began illustration for the press and practised water-colour painting, but his chief success was derived from book illustration In 1891 he joined the staff of *Punch*, and became one of its most famous artists. He was knighted in 1925.

PARTRIDGE, WILLIAM ORDWAY (1861–), American sculptor, was born at Paris, France, on April 11, 1861 He received his training as a sculptor in Florence (under Galli), in Rome (under Welonski), and in Paris He became a lecturer and writer, chiefly on art subjects, and from 1894 to 1897 was professor of fine arts in Columbia university (now the George Washington university), Washington (D.C) His sculptural works include the statue of Shakespeare, Lincoln park, Chicago; the bronze statues of Alexander Hamilton and Thomas Jefferson, Columbia university; and the equestrian statue of Gen Grant, Grant Square, Brooklyn, N Y.

PARTRIDGE, any one of certain game-birds The name was originally applied to the grey partridge (*Perdix cinerea*), the only species indigenous to Britain The excellence of its flesh at table has been esteemed from the time of Martial For the sport of partridge-shooting *see* Shooting

The grey partridge has largely increased in numbers in Great Britain in the last century During incubation the normal scent of the hen is suppressed Allied species occur in eastern Siberia and in Tibet.

The common red-legged partridge of Europe, generally called the French partridge, *Caccabis rufa*, is considered the type of a separate group. This bird was introduced into England in the last quarter of the 18th century. It prefers heavy clay soils or the most infertile heaths.

In Africa north of the Atlas is the Barbary partridge, *C petrosa;* in southern Europe another, *C. saxatilis*, which extends eastward till it is replaced by *C chukar*, which reaches India. Two desert forms are *Ammoperdix heyi* of North Africa and Palestine and *A bonhami* of Persia. The francolins and snow-partridges are generally furnished with strong but blunt spurs. Of the former, *Francolinus vulgaris* used to be found in many parts of the south of Europe; it extends to India, where it is known as the black partridge. The snow-partridges (*Tetraogallus*) are the giants of their kin, and nearly every considerable range of mountains in Asia seems to possess its specific form.

The name "partridge" has been loosely applied in North America to the ruffed grouse (*Bonasa umbellus*), the Virginia quail (*Ortyx virginianus*) and other species. In South America

the name is given to various tinamous (q.v.).

PARTRIDGE BERRY (*Mitchella repens*), a North American plant of the madder family (Rubiaceae), growing in dry woods from Nova Scotia to Minnesota and southward to Florida and Texas. It is evergreen, with a trailing stem, round, often whitish veined leaves, and white flowers, often borne in pairs, which are replaced by scarlet, edible berries. The flowers are dimorphic, long-styled and short-styled forms occurring, as in the primrose. The plant is also called checkerberry, squaw-vine and twin flower.

PARTS OF SPEECH: *see* GRAMMAR.

PARTY WALL, a building term, which in England and the United States, means a solid dividing wall between two houses, to be used by each as an exterior wall without any exclusive use by either Two views as to the rights of adjoining owners in the property wall are commonly held. one that they are tenants in common of the wall, each owning an undivided moiety therein, the other that each owns in severalty the part thereof on his side of the line and possesses an easement of support in the other part. The creation of rights in party walls, apart from statute, results from contract or prescription, that is, long continued use giving a right to an easement of support. Statutes, such as the London Building Act, 1894, commonly govern the creation of party walls in cities and towns, permitting an adjoining owner to rest one half of a party wall upon the land of his neighbour and enter the land for that purpose Some statutes impose a duty upon the neighbour to contribute to the cost of erecting a party wall. Neither owner may interfere with the wall to the detriment of the other and the expenses of repairing it are commonly to be shared by both. The easements of reciprocal support continue as long as the wall is sufficient for the purposes and as long as the necessity for the exercise of the easement exists.

PASADENA, a city of Los Angeles county, California, U S A, in the foot-hills of the Sierra Madre mountains, overlooking the San Gabriel valley; 11 m N E of the business centre of Los Angeles and touching its boundaries at several points. It is served by the Santa Fe, the Southern Pacific, and the Union Pacific railways, and by inter-urban electric and motor-coach lines. Pop. 45,354 in 1920 (82% native white); estimated locally at 80,000 in 1928. The city occupies 17 sq m., at an altitude of 800–1,200 ft, with the pine-clad heights of Mt. Wilson (6,666 ft) and Mt. Lowe (6,100 ft) for background. It is primarily a residential city and year-round resort, noted for its own beauty and the varied charm of the surrounding scenery. Roses bloom through the winter, and on New Year's Day is held the "Tournament of Roses," a festival attended by 700,000 visitors During the preceding week a rare spectacle is offered in the suburb of Altadena by the illumination every night of "the street of the Christmas-trees," an avenue lined for more than a mile on both sides with Himalayan cedars, or deodars. An outdoor amphitheatre seating 70,000 (called the Rose Bowl) has been constructed in a dry canyon, and is the scene of many pageants, festivals and athletic events. The city has an art institute, a Community playhouse (one of the earliest and most successful of the "little theatres" of the country), and a beautiful new public library (1927) with outdoor reading-rooms. It is the seat of the California Institute of Technology. Busch Gardens, privately owned but open to the public, comprise 30 ac. of rare horticultural specimens and beautiful landscape-gardening. In the suburb of San Marino is the Henry E. Huntington library (one of the finest collections of first editions and manuscript literary material in the world), and the Huntington art gallery, both administered for the public under a trust established by Henry Huntington before his death. A mile above Pasadena, on Mt. Wilson, is the Solar observatory of the Carnegie Institution, equipped with the largest reflecting telescope (1928) in the world and other powerful and delicate instruments. Manufacturing is relatively unimportant, but there were 162 plants in 1928, with an annual output valued at $9,000,000. The assessed valuation of property for 1927 was $155,732,710. Bank debits in 1927 amounted to $481,058,000 There were over 34,000 telephones in use in 1928, and the number of automobiles registered from the city in 1927 (28,782) was more than one for each three of the population.

Pasadena was founded in 1874 by a colony of fruit-growers from Indianapolis, Ind, who settled on its site. The city was chartered in 1886. Since 1921 it has had a commission-manager form of government.

PASARGADAE, a city of ancient Persia, situated in the modern plain of Murghab, some 30 m N E of the later Persepolis. The name originally belonged to one of the tribes of the Persians, which included the clan of the Achaemenidae, from which sprang the royal family of Cyrus and Darius (Herod. i. 125; a Pasargadian Badres is mentioned, Herod iv 167). According to the account of Ctesias (preserved by Anaximenes of Lampsacus in *Steph. Byz.* *s v* Πασσαργάδαι; Strabo xv. 730, *cf.* 729; Nic. Damasc. fr. 66, 68 *sqq*; Polyaen vii. 6, 1. 9. 45, 2), the last battle of Cyrus against Astyages, in which the Persians were incited to a desperate struggle by their women, was fought here. After the victory Cyrus built a town, with his palace and tomb, which was named Pasargadae after the tribe (*cf.* Curt. v. 6, 10; x 1, 22) Every Persian king was, at his accession, invested here, in the sanctuary of a warlike goddess (Anaitis?), with the garb of Cyrus, and received a meal of figs and terebinths with a cup of sour milk (*Plut Artax.* 3), and whenever he entered his native country he gave a gold piece to every woman of Pasargadae in remembrance of the heroic intervention of their ancestors in the battle (Nic Damasc. *loc cit.*; Plut *Alex* 69) According to a fragment of the same tradition, preserved by Strabo (xv. 729), Pasargadae lay "in the hollow Persis (*Coele Persis*) on the bank of the river Cyrus, after which the king changed his name, which was formerly Atradates" (in Nic Damasc. this is the name of his father) The river Cyrus is the Kur of the Persians, now generally named Bandamir; the historians of Alexander call it Araxes, and give to its tributary, the modern Pulwar, which passes by the ruins of Murghab and Persepolis, the name Medos (Strabo xv. 729; Curt. v. 4, 7).

The capital of Cyrus was soon supplanted by Persepolis, founded by Darius; but in Pasargadae remained a great treasury, which was surrendered to Alexander in 336 after his conquest of Persis (Arrian iii 18, 10; Curt v. 6, 10) After his return from India he visited Pasargadae on the march from Carmania to Persepolis, found the tomb of Cyrus plundered, punished the malefactors, and ordered Aristobulus to restore it (Arrian vi. 29; Strabo xv. 730). Aristobulus' description agrees exactly with the ruins of Murghab on the Bandamir, about 30 m. upwards from Persepolis; and all the other references in the historians of Cyrus and Alexander indicate the same place The identity of the ruins of Murghab with Pasargadae has lately been established beyond doubt by the discovery of the sculpture of Cyrus, bearing the trilingual inscription "Cyrus, the great King, the Achaemenian" which can refer to none but the founder of the Achaemenian dynasty The conjecture of Oppert, that Pasargadae is identical with Pishiyauvāda, where (on a mountain Arakadri) the usurper Gaumāta (Smerdis) proclaimed himself king, and where his successor, the second false Smerdis Vahyazdāta, gathered an army (inscrip. of Behistun, i. 11; iii 41), is hardly probable. T. Markwart proposed another etymology, "pas-arkadrish," that is, "Behind the (mount) Arkadrish."

The principal ruins of the town of Pasargadae at Murghab are a great terrace like that of Persepolis, and the remainders of three buildings, on which the building inscription of Cyrus, "I Cyrus the king the Achaemenid" (*sc.* "have built this"), occurs five times in Persian, Susian and Babylonian. They were built of bricks, with a foundation of stones and stone door-cases, like the palaces at Persepolis; and on these fragments of a procession of tribute-bearers and the figure of a winged demon (wrongly considered as a portrait of Cyrus) are preserved. Outside the town is one tomb in the form of a tower, and the tomb of Cyrus himself, a stone house on a high substructure which rises in seven surrounded by a court with columns The remains of a portico, which are discernible around the tomb, belong to a mosque constructed about A.D 1300

See Sir W. Gore-Ouseley, *Travels in Persia* (1811); Morier, Ker

Porter, Rich and others; Texier, *Description de l'Arménie et la Perse;* Flandin and Coste, *Voyage en Perse,* vol. ii.; Stolze, *Persepolis;* Dieulafoy, *L'Art antique de la Perse;* and E. Herzfeld, " Pasargadae," in *Beiträge zur alten Geschichte,* vol. viii. (1908), who has in many points corrected and enlarged the earlier descriptions and has proved that the buildings as well as the sculptures are earlier than those of Persepolis, and are, therefore, built by Cyrus the Great. New photographs of the monuments are published by Fr. Sarre, *Iranische Felsreliefs* (unter Mitwirkung von E. Herzfeld, Berlin, 1908).

PASCAL, BLAISE (1623–1662), French religious philosopher and mathematician, was born at Clermont Ferrand, in Auvergne, on June 19, 1623, son of Étienne Pascal, president of the Court of Aids at Clermont; his mother's name was Antoinette Bégon. His mother died when he was about four years old, and left him with two sisters—Gilberte, who afterwards married M. Périer, and Jacqueline. When Pascal was about seven years old his father gave up his post at Clermont, and settled in Paris. It does not appear that Blaise, who went to no school, but was taught by his father, was at all forced, but rather the contrary. But he was a precocious child, whose precocity was followed by great performance at maturity.

Étienne Pascal incurred the displeasure of Richelieu by protesting against the reduction of the rate of interest on some Paris municipal bonds, and to escape the Bastille had to go into hiding. He is said to have been restored to favour owing to the success of Jacqueline in a representation of Scudéry's *Amour tyrannique* before the cardinal. In any case Richelieu gave Étienne Pascal (in 1639) the important intendancy of Rouen, which he held for nine years. At Rouen they became acquainted with Corneille. The year 1646 is a landmark in Pascal's life. His father was confined to the house in consequence of an accident, and was visited by persons who had come under the influence of Saint-Cyran and the Jansenists. The Pascal family had hitherto paid due respect to religious matters, but they had not regarded religion as all-absorbing; but they now became converts to Jansenism.

But though his family, and especially his sister Gilberte, now Madame Périer, became strict devotees, it does not appear that Pascal had yet accepted the full consequences of the new doctrine. He continued to be indefatigable in his mathematical work in spite of nearly continuous illness. In 1647 he published his *Nouvelles expériences sur le vide,* and in the next year the famous experiment with the barometer on the Puy de Dôme was carried out for him by his brother-in-law Périer, and repeated on a smaller scale by himself at Paris, to which place by the end of 1647 he and his sister Jacqueline had removed, to be followed shortly by their father. In a letter of Jacqueline's, dated Sept. 27, an account of a visit paid by Descartes to Pascal is given. Descartes and Torricelli had suggested the principle of the barometer, but Pascal's experiments were the first complete demonstration.

Port Royal.—As early as May 1648 Jacqueline Pascal was strongly drawn to Port Royal, and her brother frequently accompanied her to its church. She desired indeed to join the convent, but her father, who returned to Paris with the dignity of counsellor of state, disapproved of the plan, and took both brother and sister to Clermont, where Pascal remained for the greater part of two years. He, his sister and their father returned to Paris in the late autumn of 1650, and in September of the next year Étienne Pascal died. Almost immediately afterwards Jacqueline joined Port Royal—a proceeding which led to some soreness, finally healed, between herself and her brother and sister as to the disposal of her property. It has sometimes been supposed that Pascal, from 1651 or earlier to the famous accident of 1654, lived a dissipated, extravagant, worldly, luxurious (though admittedly not vicious) life with his friend the duc de Roannez and others. His *Discours sur les passions de l'amour,* assigned to this period, has been supposed, on quite insufficient grounds, to indicate a hopeless passion for Charlotte de Roannez, the duke's sister. What is certain is that the winter of 1653–54 was one of hard scientific work and saw the production of some of his most important treatises. At the same time he sought some other than the Christian solution to the problem of existence, and made a close study of Epictetus and of Montaigne. He found satisfaction in neither. He began to visit his sister at Port Royal. After two months of seeking God, Pascal suddenly, when alone in his room on Nov. 22, underwent conversion, the mystic experience suffered and described by many of the great religious thinkers. His record of it, written in disjointed sentences, he wore thenceforward as a kind of amulet. At the time he said nothing of his conversion, but he presently decided (Jan. 7, 1655) to go into retreat for a time at Port Royal. He was thirty-two, prematurely aged by suffering.

Though Pascal lived much at Port Royal, and partly at least observed its rule, he was never of it. At the end of 1655 a motion was brought forward to expel Antoine Arnauld from the Sorbonne, the immediate cause of the attack being Arnauld's *Lettres à un duc et pair* on the refusal of absolution by his parish priest to the duc de Liancourt on account of his alleged Jansenist leanings. Pascal undertook Arnauld's defence against the Jesuits. The first of the *Provinciales* (*Provincial Letters,* properly *Lettres écrites par Louis de Montalte à un provincial de ses amis*) was written in a few days. It appeared on Jan. 27, 1656, and was followed by others to the number of eighteen. The *Provincial Letters* are the first example of French prose which is at once considerable in bulk, varied and important in matter, perfectly finished in form. They owe not a little to Descartes, for Pascal's indebtedness to his predecessor is unquestionable from the literary side, whatever may be the case with the scientific. The first example of polite controversial irony since Lucian, the *Provinciales* have continued to be the best example of it during more than two centuries in which the style has been sedulously practised, and in which they have furnished a model to generation after generation.

Last Years.—Shortly after the appearance of the *Provinciales,* on May 24, 1656, occurred the miracle of the Holy Thorn, a fragment of the crown of Christ preserved at Port Royal, which cured the little Marguerite Périer of a fistula lacrymalis. The Jesuits were much mortified by this Jansenist miracle, which, as it was officially recognized, they could not openly deny. Pascal and his friends rejoiced in proportion. The details of his later years after this incident are somewhat scanty, though in 1658 he lectured to the leaders of Port Royal on Christian apologetics, embodying the substance of a work which he had been considering since the *Provinciales.* Two drafts of the lecture were made by friends, and one of these, by his nephew Étienne Périer, is preferred to the Port Royal editions of the *Pensées.* For years before his death we hear only of acts of charity and of, as it seems to modern ideas, extravagant asceticism. Thus Mme. Périer tells us that he disliked to see her caress her children, and would not allow the beauty of any woman to be talked of in his presence. What may be called his last illness began as early as 1658, and as the disease progressed it was attended with more and more pain, chiefly in the head. In June 1662, having given up his own house to a poor family who were suffering from small-pox, he went to his sister's house to be nursed, and never afterwards left it. His state was, it seems, mistaken by his physicians, so much so that the offices of the Church were long put off. For the last year of his life he had relinquished his questions, and had been preparing himself, as a humble Christian, for death. He was able, however, to receive the Eucharist, and soon afterwards died in convulsions on Aug. 19. A post mortem examination was held, which showed not only grave derangement in the stomach and other organs, but a serious lesion of the brain.

Pensées.—Eight years after Pascal's death, in 1670, appeared what purported to be his *Pensées.* The editing of the book was peculiar. It was submitted to a committee of influential Jansenists, with the duc de Roannez at their head. It does not appear that there was much suspicion of the garbling which had been practised, but as a matter of fact no more entirely factitious book ever issued from the press. The fragments which it professed to give were in themselves confused and incoherent enough, nor is it easy to believe that they all formed part of any single and coherent design. The editors omitted, altered, added, separated, combined at their pleasure. This rifacimento remained the standard text with a few unimportant additions for nearly two

centuries, except that, by a truly comic revolution of public taste, Condorcet in 1776 published, after study of the original, which remained accessible in manuscript, another garbling, conducted this time in the interests of *un*orthodoxy. In 1842 Victor Cousin drew attention to the absolutely untrustworthy condition of the text, and in 1844 A. P. Faugère edited that text from the ms. in something like a condition of purity, though, as subsequent editions have shown, not with absolute fidelity. The subjects dealt with concern more or less all the great problems of thought on what may be called the theological side of metaphysics—the sufficiency of reason, the trustworthiness of experience, the admissibility of revelation, free will, foreknowledge, and the rest. Speaking generally, the tendency of the *Pensées* is towards the combating of scepticism by a deeper scepticism, or, as Pascal himself calls it, Pyrrhonism, which occasionally goes the length of denying the possibility of any natural theology. Pascal explains all the contradictions and difficulties of human life and thought by the doctrine of the Fall, and relies on faith and revelation alone to justify each other.

Natural Philosopher and Mathematician.—Pascal was a great mathematician in an age which produced Descartes, Fermat, Huygens, Wallis and Roberval His precocity in mathematics is established by the fact that he had completed before he was sixteen years of age a work on the conic sections, in which he had laid down a series of propositions, discovered by himself, of such importance that they may be said to form the foundations of the modern treatment of that subject. This work (like many others by the same master hand) was never published We know something of what it contained from a report by Leibnitz, who had seen it in Paris, and from a *résumé* of its results published in 1640 by Pascal himself, under the title *Essai pour les coniques*. The method was that of Girard Desargues, viz , the transformation of geometrical figures by conical or optical projection. In this way he established the famous theorem that the intersections of the three pairs of opposite sides of a hexagon inscribed in a conic are collinear This proposition, which he called the mystic hexagram, he made the keystone of his theory; from it alone he deduced more than 400 corollaries, embracing, according to his own account, the conics of Apollonius, and other results innumerable.

Pascal also worked on the infinitesimal calculus, then in the embryonic form of Cavalieri's method of indivisibles. The cycloid was a famous curve in those days; it had been discussed by Galileo, Descartes, Fermat, Roberval and Torricelli, who had in turn exhausted their skill upon it. Pascal solved the hitherto refractory problem of the general quadrature of the cycloid, and proposed and solved a variety of others relating to the centre of gravity of the curve and its segments, and to the volume and centre of gravity of solids of revolution generated in various ways by means of it He published a number of these theorems without demonstration as a challenge to contemporary mathematicians. Solutions were furnished by Wallis, Huygens, Wren and others; and Pascal published his own in the form of letters from Amos Dettonville (his assumed name as challenger) to Pierre de Carcavy. His initiative led to a great extension of our knowledge of the properties of the cycloid, and indirectly hastened the progress of the differential calculus

The mathematical theory of probability and the allied theory of the combinatorial analysis were in effect created by the correspondence between Pascal and Fermat, concerning certain questions as to the division of stakes in games of chance, which had been propounded to the former by the gaming philosopher De Méré. Of the treatise *De aleae geometria* all that actually appeared was a fragment on the arithmetical triangle (*Traité du triangle arithmétique*, "Properties of the Figurate Numbers"), printed in 1654, but not published till 1665, after his death.

Pascal's work as a natural philosopher was not less remarkable than his discoveries in pure mathematics. His experiments and his treatise (written before 1651, published 1663) on the equilibrium of fluids entitle him to rank with Galileo and Stevinus as one of the founders of the science of hydrodynamics The idea of the pressure of the air and the invention of the instrument for measuring it were both new when he made his famous experiment, showing that the height of the mercury column in a barometer decreases when it is carried upwards through the atmosphere. This experiment was made by himself in a tower at Paris, and was carried out on a grand scale under his instructions by his brother-in-law Florin Périer on the Puy de Dôme in Auvergne. Its success greatly helped to break down the old prejudices, and to bring home to the minds of ordinary men the truth of the new ideas propounded by Galileo and Torricelli.

Whether we look at his pure mathematical or at his physical researches we see the strongest marks of a great original genius creating new ideas, and seizing upon, mastering, and pursuing farther everything that was fresh and unfamiliar in his time. We can still point to much in exact science that is absolutely his; and we can indicate infinitely more which is due to his inspiration.

Bibliography —Editions of Pascal's works are those by Bossut (5 vols. 1779), Renouard (1803), Lefèvre (1819), and Lahure (1858) The standard edition is by Brunschwig and Boutroux in the *Grands écrivains de la France* (14 vols., Paris, 1908–14). There is also a separate edition of the *Pensées* by Brunschwig (1904). Among other modern editions of the *Pensées* may be mentioned that of Molinier (1877–79), a carefully edited and interesting text, the important corrections of which have been introduced into Havet's last edition, and that of G. Michelant (Freiburg, 1896). The main original source for the biography of Pascal is P. Faugère, *Lettres, opuscules et mémoires de Mme Périer et de Jacqueline, soeurs de Pascal, et de Marguerite Périer, sa nièce* (Paris, 1645) Works on Pascal are innumerable· Sainte-Beuve's *Port Royal,* Cousin's writings on Pascal and his *Jacqueline Pascal,* and the essays of the editors of the *Pensées* first mentioned are the most noteworthy. Recent handlings are, in French, E. Boutroux's *Pascal* (Paris, 1903), and, in English, R. H. Soltau, *Pascal· The Man and the Message* (1927), which contains a selected bibliography.

PASCAL, JEAN LOUIS (1837–1920), French architect, was born in Paris June 4, 1837. At the age of 16 he became a pupil of Gilbert. Later, when in the studio of Questel, he entered the École des Beaux-Arts, and amongst other distinctions gained the *Grand Prix de Rome* in 1866 On his return to Paris in 1870, after his four years at the Villa Medici, he was appointed inspector of works at the Louvre and the Tuileries. He became a member of the council of the Beaux-Arts and of the Institut de France, and was made a commandeur of the Legion of Honour. Pascal's work ranged from the commemorative monuments, erected to Henri Regnault at the École des Beaux-Arts and President Carnot at Bordeaux, to public and private buildings of every description He lived long enough to see the completion of his great work, the Bibliothèque Nationale, Paris With M Gaudet, he is responsible for the splendid edition of Blondel's *Architecture Française*, published under the auspices of the French Government. The celebrated *atelier,* of which he was for so many years the head, is responsible for the training of architects from every country in Europe, the United States and Canada Pascal died in Paris in 1920.

PASCHAL I., pope from 817 to 824, a native of Rome, was raised to the pontificate by the acclamation of the clergy, shortly after the death of Stephen IV., and before the sanction of the emperor (Louis the Pious) had been obtained—a circumstance for which it was one of his first cares to apologize. His relations with the imperial house, however, never became cordial; and he failed to win over the Roman nobles. He died in Rome while the imperial commissioners were investigating the circumstances of the murder of two important Roman personages seized at the Lateran The successor of Paschal I was Eugenius II.

PASCHAL II. (Ranieri), pope from Aug. 16, 1099, to Jan. 21, 1118, a native of Bieda, near Viterbo, was a Cluniac monk. He was created cardinal-priest of S Clemente by Gregory VII. about 1076, and was consecrated pope in succession to Urban II. on Aug. 14, 1099. In the long struggle with the emperors over investiture, he zealously carried on the Hildebrandine policy, but with only partial success. In 1104 Paschal instigated the emperor's second son to rebel against his father, but soon found Henry V. even more persistent in maintaining the right of investiture than Henry IV. had been. The imperial Diet at Mainz invited (Jan. 1106) Paschal to visit Germany and settle the trouble, but the pope in the Council of Guastalla (Oct. 1106) simply renewed the prohibition of investiture. In the same year he ended the investiture struggle in England. At the close of 1106 he

sought in vain the mediation of King Philip and Prince Louis in the imperial struggle, but, his negotiations remaining without result, he returned to Italy in Sept. 1107.

When Henry V. advanced with an army into Italy in order to be crowned, the pope agreed to a compromise, but the Romans rose in revolt against the compact, and Henry retired taking with him pope and curia. After sixty-one days of harsh imprisonment, Paschal yielded and guaranteed investiture to the emperor. Henry was then crowned in St. Peter's on April 13, and withdrew beyond the Alps. The Hildebrandine party was aroused to action, however; a Lateran council of March 1112 declared null and void the concessions extorted by violence; a council held at Vienna in October actually excommunicated the emperor, and Paschal sanctioned the proceeding. Towards the end of the pontificate trouble began anew in England. On the death of the countess Matilda, who had bequeathed all her territories to the Church (1115), the emperor at once laid claim to them as imperial fiefs and forced the pope to flee from Rome. Paschal returned after the emperor's withdrawal at the beginning of 1118, but died within a few days on Jan. 21, 1118. His successor was Gelasius II.

The principal sources for the life of Paschal II. are his Letters in the *Monumenta Germaniae historica, Epistolae,* vols. 3, 6, 7, 13, 17, 20–23, 25, and the *Vita* by Petrus Pisanus in the *Liber pontificalis,* ed. Duchesne (Paris, 1892). Important bulls are in J. A. G. von Pflugk-Harttung, *Die Bullen der Päpste bis zum Ende des zwölften Jahrhunderts* (Gotha, 1901), and a valuable digest in Jaffé-Wattenbach, *Regesta pontif. roman.* (1885–88). There is an exhaustive bibliography with an excellent article by Carl Mirbt in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1904). *See* the *Catholic Encyclopaedia.* (C. H. H.)

PASCHAL III., anti-pope from 1164 to 1168, was elected the successor of Victor IV. on April 22, 1164. He was an aged aristocrat, Guido of Crema. Recognized at once by the emperor Frederick I. he soon lost the support of Burgundy, but the emperor crushed opposition in Germany, and gained the co-operation of Henry II. of England. Supported by the victorious imperial army, Paschal was enthroned at St. Peter's on July 22, 1167, and Pope Alexander III. became a fugitive. Suddenly imperial reverses, however, made Paschal glad in the end to hold so much as the quarter on the right bank of the Tiber, where he died on Sept. 20, 1168. He was succeeded by the anti-pope Callixtus III.

See A. Hauck, *Kirchengeschichte Deutschlands,* Bd. IV. (Leipzig, 1903, 259–276); H. Böhmer in Herzog-Hauck, *Realencyklopädie,* Bd. XIV., 724 *seq.;* and Lobkowitz, *Statistik der Päpste* (Freiburg i. B., 1905).

PASCHAL CHRONICLE (Chronicum Alexandrinum or Constantinopolitanum; Fasti Siculi), so called from being based on the Easter canon, an outline of chronology from Adam to A.D. 629, with historical and theological notes. The work, which has lost some parts, has an introduction on Christian chronology and the Easter cycle. It was written under Heraclius (610–641), and is generally attributed to an unknown Byzantine cleric and friend of the patriarch Sergius, who is alluded to as the author of certain ritual innovations. The so-called Byzantine or Roman era (which continued in use in the Greek Church until its liberation from the Turkish rule) was adopted in the *Chronicum* for the first time as the foundation of chronology, in accordance with which the date of the creation is given as March 21, 5507. The author is merely a compiler from earlier works except in his history of the last 30 years.

Editions: Dindorf (1832) with Ducange's preface and notes, in *Corp. scriptorum hist. byzant.;* Migne, *Patrolog. graeca.* xcii.; *see* also Wachsmuth, *Einl. ins Studium der alten Geschichte* (1895); Gelzer, *Sextus Africanus,* ii. 1 (1885); v. der Hagen, *Observationes in Heraclii methodum paschalem* (1736, but still indispensable); Schwarz in Pauly-Wissowa, *Realencyclop.* iii., pt. 2 (1899); Krumbacher, *Gesch. der byzant. Litt.* (1897).

PASCOLI, GIOVANNI (1855–1912), Italian poet, was born at San Mauro di Romagna on Dec. 31, 1855. He studied at the college of the Scolopi fathers at Urbino, and at the University of Bologna. He then became a secondary school teacher. In 1891 he published his first volume of verse, *Myricae.* He then held chairs successively at the Universities of Bologna, Messina and Pisa, and, finally, was appointed to succeed Carducci as professor of Italian literature at Bologna. He published other volumes of poetry, *Primi poemetti* (1912), *Nuovi poemetti, Canti di Castelvecchio, Poemi conviviali, Poemi del Risorgimento, Canzoni di Re Enzio* (1908) and *Carmina* (in Latin). Pascoli was a mystic, given to meditation and solitude, and his poetic output faithfully reflects the characteristics of his melancholy and extremely sensitive temperament. He died at Bologna on April 6, 1912.

See A. Galletti, *La poesia e l'arte di G. Pascoli* (1918); J. J. Hartman, *De Joanne Pascoli poeta Latino* (1920); F. Morabito, *Il Misticismo di Giovanni Pascoli* (1920); A. Valentin, *I Pascoli, Les thèmes de son inspiration* (1925).

PAS-DE-CALAIS, a maritime department of northern France, formed in 1790 of nearly the whole of Artois and the northern maritime portion of Picardy including Boulonnais, Calaisis, Ardrésis, and the districts of Langle and Bredenarde, and bounded north by the Straits of Dover ("Pas de Calais"), east by the department of Nord, south by that of Somme, and west by the English channel. Pop. (1926) 1,171,912; area 2,606 sq.m. Except in the neighbourhood of Boulogne-sur-Mer with its *côtes de fer* or "iron coasts," the seaboard of the department, which measures 65 m., consists of dunes. From the mouth of the Aa (the limit towards Nord) it trends west-south-west to Gris Nez, the point of France nearest to England; in this section lie the port of Calais, Cape Blanc Nez, rising 440 ft. above the sandy shores, and the port of Wissant (Wishant). The seaside resorts include Boulogne, Berck-sur-Mer, Paris-Plage, Wimereux, etc. Beyond Griz Nez the direction is due south; in this section are the small port of Ambleteuse, Boulogne at the mouth of the Liane, and the two bays formed by the estuaries of the Canche and the Authie (the limit towards Somme).

The dominant feature of the department is the Cretaceous scarp extending north-westward towards the sea, and revealing, between Boulogne and Calais, lower Cretaceous, Jurassic and a little Palaeozoic rock in what is really the eastern end of the Wealden dome of south-east England. The greatest height reached by the scarp in the department is about 710 ft. in the north-west. The scarp overlooks the plains of Flanders on the north and is the source of the Aa, Lys, Scarpe, Sensée and Escant. It is the defensible line of France in the north, and most of it remained in the possession of the Franco-British armies throughout the World War, but the ridges of Vimy and Bapaume were the scenes of very severe fighting, and the German armies penetrated across the continuation of the scarp farther to the south-east. To the north of the hills running between St. Omer and Boulogne, to the south of Gravelines and the south-east of Calais, lies the district of the Wattergands, fens now drained by means of canals and dikes, and turned into highly productive land. The climate is free from extremes of heat and cold, but damp and changeable. At Arras the mean annual temperature is 47°; on the coast it is higher. The rainfall varies from 24 to 32 in., though at Cape Gris Nez the latter figure is much exceeded. Cereals are largely grown and also potatoes, sugar-beets, forage, oil-plants and tobacco. Market gardening flourishes in the Wattergands. Livestock and poultry are reared, and the horses of the Boulonnais are famous.

The department is the chief in France for the production of coal, its principal coal-basin, a continuation of that of Valenciennes, centring round Béthune. The manufacture of beetroot-sugar, oil and alcohol distilling, iron-working, dyeing, brewing, paper-making, and various branches of the textile manufacture, are the chief industries. Boulogne, Calais and Étaples equip vessels for the cod, herring and mackerel fisheries. Calais and Boulogne are important ports of passenger-transit for England; and Boulogne also carries on a large export trade in the products of the department. The canal system comprises part of the Aa, the Lys, the Scarpe, the Deûle (a tributary of the Lys passing by Lille), the Lawe (a tributary of the Lys passing by Béthune), and the Sensée (an affluent of the Scheldt), as well as the canals of Aire to Bauvin, Neuffossé, Calais, Calais to Ardres, etc., and thus a line of communication is formed from the Scheldt to the sea by Béthune, St. Omer and Calais, with branches to Gravelines and Dunkirk. The department is served by the Northern railway.

Pas-de-Calais forms the diocese of Arras (archbishopric of Cambrai), belongs to the district of the I. army corps, the edu-

cational division (académie) of Lille; the appeal court is at Douai. There are five arrondissements (Arras, Béthune, Boulogne, Montreuil-sur-Mer and St. Omer) with 46 cantons and 905 communes. The chief towns are Arras, the capital, Boulogne, Calais, St. Omer, Béthune, Lens, Montreuil-sur-Mer, Bruay, Berck, Étaples and Aire-sur-la-Lys (*qq.v.*). Liévin (24,054), Hénin-Liétard (21,370), in the neighbourhood of Lens, are large centres of population. Lillers (pop. 5,453) carries on boot-making and has a fine 12th century Romanesque church; Hesdin owes its regular plan to Charles V, by whom it was built; and St Pol has the remains of medieval fortifications and castles and gave its name to the famous counts of St. Pol.

PASDELOUP, JULES ÉTIENNE (1819–1887), French conductor, was born in Paris, and educated in music at the *conservatoire*. He founded in 1851 a "société des jeunes artistes du conservatoire," and, as conductor of its concerts, produced many new works and introduced many classical works hitherto not heard in Paris His "popular concerts" at the Cirque d'hiver, from 1861 till 1884, much improved French taste in music

PASHA, also written "pacha" and formerly "pashaw," etc., a Turkish title, superior to that of bey (*q.v.*), borne by persons of high rank and placed after the name. The title appears, originally, to have been bestowed exclusively upon military commanders, but it is now given to any high official, and also to unofficial persons whom it is desired to honour A pashalik was a province governed by or under the jurisdiction of a pasha

The word is variously derived from the Persian *pādshah,* Turkish *pādishah,* equivalent to king or emperor, and from the Turkish *bash,* in some dialects *pash,* a head, chief, etc In old Turkish there was no fixed distinction between *b* and *p*. As first used in western Europe the title was written with the initial *b* The English forms bashaw, bassaw, bucha, etc, of the 16th and 17th centuries, were derived through the med Lat and Ital *bassa.*

PAŠIČ, NICHOLAS (1846?–1926), Serbian statesman, was the son of a merchant at Zaječar, close to the Bulgarian frontier He studied engineering first at Belgrade and then, with the help of a State bursary, at the University of Zürich, where he and other young Serbs came under the influence of Bakunin. Pašič was one of a small group who surrounded Svetozar Marković, and on the latter's early death in 1875 became one of the chief exponents of his views, which were of capital importance for the political development of Serbia. He became a deputy in 1878, and was in 1881 one of the founders of the Radical party.

A popular rising which broke out at Zaječar in 1883 led to the arrest of most of the Radical leaders and fresh repressive measures. Pašič fled across the Danube and was condemned to death *in absentia,* remaining in exile till after King Milan's abdication in 1889 On his return he became president of the Skupština and on two occasions mayor of Belgrade. He was premier for the first time from Feb. 1891 to Aug. 1892, and as foreign minister accompanied the young King Alexander on his first visit to the Tsar. As a strong Russophile he was made Serbian minister in St. Petersburg, but resigned as a mark of protest against the illegal return of King Milan to Serbia in 1894 The Radicals were now in keen opposition, and when an attempt was made on the ex-king's life in 1899 the Government rid itself of their leaders by trumped-up charges of engineering the crime, and imposed savage sentences of forced labour. Pašić, thanks to Russian remonstrances, received only five years and was then amnestied on condition of leaving the country. He returned only after Milan's final withdrawal. After the fall of the Obrenović dynasty in 1903 the Radical party became dominant, and Pašić was foreign minister in 1904 and premier in 1906 and again from 1908–10. He shared in Milovanović's negotiations for a Balkan league and on Milovanović's death in 1912 became the dominant figure in the Radical party, resuming the premiership on the very eve of war with Turkey. He remained in office throughout the two Balkan wars, and contributed materially towards the alliance with Greece and the *rapprochement* with Rumania. While his foreign policy was essentially Russophile, he, on two occasions, in 1912–13 made overtures to Vienna, which were rejected.

The murder of the Archduke at Sarajevo brought the already strained relations with Austria-Hungary to a head. But so absorbed was Pašič in internal politics that he was absent from Belgrade when the fateful ultimatum was presented, and even then was preparing to visit Venizelos at Salonica when an urgent message recalled him. Party discord was silenced by the national danger, the elections were postponed and the already dissolved Parliament reassembled at Niš. In November, a coalition cabinet was formed, but Pašič remained premier, and when in 1917 the Opposition again seceded, he once more formed a purely Radical Government

The revolution of March 1917 and the fall of Tsardom weakened Pašić's position both at home and abroad, forcing him to recede from his strictly Pan-serb and Orthodox attitude, and to negotiate, upon equal terms, with the Yugoslav committee under Dr Trumbić, the so-called "declaration of Corfu" (July 1917), which laid down the broad lines of the future unified Yugoslav State But his relations with the committee became increasingly strained, and he stubbornly denied to them any status in the allied camp and refused to admit them to a coalition cabinet. This attitude was the main reason why the Entente governments withheld from the Yugoslavs that recognition which they accorded in Aug 1918 to the much less favourably situated Czechoslovaks. The result was that Austria-Hungary collapsed before any agreement had been reached among the Allies on the Yugoslav problem, and that Italy, abandoning the compromise reached at the Roman Congress of Oppressed Nationalities in the previous April, reasserted her full territorial claims under the secret Treaty of London Despite this dangerous situation Pašič maintained his obstructive tactics not merely towards the Yugoslav committee but also towards the new provisional Government which had been formed in Zagreb and which had at once nominated Trumbić as its spokesman in Paris Finally, a certain compromise was reached, and while Protić became the first premier of Yugoslavia, Pašič was made first delegate to the Peace conference, with Trumbić and Vesnić as his colleagues

In Jan 1921 Pašič again became premier, and thanks partly to his skilful bargaining with the minor groups and partly to the foolish abstention of the Croat Peasant party, he was able to manoeuvre the new centralist constitution through parliament (June 28, 1921), and to suppress the Communist Party In the following winter he manoeuvred his Democratic allies out of the Government and formed a purely Radical cabinet At the elections of March 1923 he failed to secure a majority, but was again saved by the blunders of the Opposition Though from July to Oct. 1924 he had to give place to a coalition cabinet under Davidović, he returned to power stronger than ever

In Feb. 1925 he again dissolved parliament, threw Radić and his colleagues into prison, and by the adoption of extremely drastic electoral measures secured a small working majority. Radić hereupon made his famous recantation (*see* RADIĆ, STJEPAN) and entered the cabinet in October The two strongest parties in Yugoslavia were now temporarily united; but the situation became increasingly difficult On April 4, 1926 Pašič, whose health was failing, handed the premiership over to Ouzounović. He died on Dec 10, 1926

PASIG, a municipality (with administration centre and 24 *barrios* or districts) and the capital of the province of Rizal, Luzon, Philippine Islands, about 6 m. E S E of Manila Pop. (1918), 16,767, of whom 21 were whites. Pasig is located on the Pasig river (the outlet of Laguna de Bay which reaches the sea at Manila) and its tributary the Mariquina Ft. McKinley, a large military post established for the troops from the United States, lies in the south-west part of the municipality The principal industries are rice farming, the manufacture of a cheap red pottery and fishing The language spoken is Tagalog.

PASKEVICH, IVAN FEDOROVICH (1782–1856), count of Erivan, prince of Warsaw, Russian field marshal, was born at Poltava on May 19, 1782 He entered the army through the imperial institution for pages in 1800, saw much active service, and by 1828 had reached the rank of field marshal. In 1830 he subdued the mountaineers of Daghestan. In 1831 he suppressed the

revolt of Poland, and after the fall of Warsaw, which gave the death-blow to Polish independence, he was raised to the dignity of prince of Warsaw, and created viceroy of the kingdom of Poland. On the outbreak of the insurrection of Hungary in 1848 he commanded the Russian troops sent to the aid of Austria, and compelled the surrender of the Hungarians at Világos. In April 1854 he commanded the army of the Danube, but on June 9, at Silistria, he was defeated. He died on Feb. 13, 1856 at Warsaw.

See Tolstoy, *Essai biographique et historique sur le feld-maréchal Prince de Varsovie* (Paris, 1835); *Notice biographique sur le Maréchal Paskévitch* (Leipzig, 1856); and Prince Stcherbatov's *Life* (St. Petersburg, 1888–94).

PASQUE-FLOWER, the name applied to two species of *Anemone* (*q.v.*), of the family Ranunculaceae (*q.v.*). They are low, stemless, densely silky-hairy perennial herbs, rising from thick rootstocks, and bearing long-stalked, digitately-divided leaves and large purple or lavender flowers, followed by a fruiting head of silky achenes with long feathery tails (styles). The European pasque-flower (*A. Pulsatilla*), with violet purple flowers, wide-spread on the Continent, grows in chalky pastures in England. The American pasque-flower (*A. patens* var. *Wolfgangiana*), with light bluish or pale lavender flowers, is abundant on prairies from Illinois to Alberta and southward in the Great Plains to Texas; it occurs also in British Columbia. Both species are more or less planted in gardens. By some botanists the pasque-flowers have been placed in a separate genus *Pulsatilla*, the European plant becoming *P. vulgaris* and the American, *P. hirsutissima*.

PASQUIER, ÉTIENNE (1529–1615), French lawyer and man of letters, was born at Paris, on June 7, 1529, by his own account, according to others a year earlier. He was called to the Paris bar in 1549. In 1560 he published the first book of his *Recherches de la France*. In 1565, when he was 36, his fame was established by a great speech still extant, in which he pleaded the cause of the University of Paris against the Jesuits, and won it. Meanwhile he pursued the *Recherches* steadily. He left accounts of the jests of himself and his colleagues at the *Grands Jours* of Poitiers in 1579 (the celebrated collection of poems on a flea) and Troyes in 1583. In 1585 Pasquier was appointed by Henry III. advocate-general at the Paris cour des comptes. He died on Sept. 1, 1615.

Pasquier's work was considerable, and it has never been fully collected or indeed printed. The standard edition is that of Amsterdam (2 vols., 1723). But for ordinary readers the selections of Léon Feugère, published at Paris (2 vols., 1849), with an elaborate introduction, are most accessible. As a poet Pasquier is chiefly interesting as a minor member of the Pléiade movement. As a prose writer he is of much more account. The three chief divisions of his prose work are his *Recherches*, his letters and his professional speeches. *See* H. Gaudrillait, "Etienne Pasquier," in the *Séance publique* of the Institut Royal for 1839.

PASQUIER, ÉTIENNE DENIS, Duke (1767–1862), French statesman, was born on April 22, 1767. He was a counsellor of the Paris parlement. Napoleon in 1810 made him prefect of police. He was captured in the strange conspiracy of the republican general, Malet (Oct. 1812), who, giving out that Napoleon had perished in Russia, managed to surprise and capture some of the ministers and other authorities at Paris. He soon, however, regained his liberty.

When Napoleon abdicated in April 1814 Pasquier resigned the prefecture of police, whereupon Louis XVIII. allotted to him the control of roads and bridges. He held various ministerial offices under Louis XVIII., but refused to join the reactionary cabinets of the close of the reign of Charles X. After the July Revolution (1830) he became president of the Chamber of Peers —a post which he held through the whole of the reign of Louis Philippe (1830–48). In Feb. 1848, Pasquier retired from active life. He died in 1862.

See *Mémoires du Chancelier Pasquier* (6 vols., 1893–95; partly translated into English, 4 vols., 1893–94). Also Louis de Viel-Castel, *Histoire de la Restauration*, vols. i.–iv. (20 vols., 1860–77).

PASSAGE RITES. The social and religious orders are concerned with, interpret, explain, and exploit the facts of the biological order. Man passes from one stage of life to another continuously. Yet there are breaks, moments of discontinuity. All the various moments of discontinuity in the social life are the occasions of passage rites. Time and place, age and status, social ideas, determine their detail, but all exhibit a common form because all serve a common purpose. What is new is dangerous. What is new may be necessary or inevitable, fore-ordained and foreseen. The nearest source of strength for the individual is found in the solidarity of his society. The cake of custom constrains and protects him. All passage rites consist of a period of separation marked by formal acts of severance, physical or symbolic. This is followed by a period of delay, sometimes of some length, and is completed by a series of rites uniting the individual to his society; indeed they make him a member of his society. Other ends may be served by subordinate ancillary rites which often acquire such prominence as to obscure the primary purpose. Thus marriage rites contain various elements but as a whole are typically passage rites. Birth rites, naming rites, initiation rites, marriage rites, and funeral rites, exhibit these essential features. The common purpose is to effect and to mark a change in the status of the individual, to affirm and to confirm the solidarity of society, and to protect the individual at the moments when by social or physical necessity he is subjected to abnormal emotional stress, and therefore dangerous.

See Consecration, Initiation, Mana, Marriage, Ritual, Tabu.

Bibliography.—A. Van Gennep, *Les Rites de Passage* (1909); A. R. Brown, *The Andaman Islanders* (1922).

PASSAIC, a city of Passaic county, New Jersey, U.S.A., on the Passaic river, 9 m. above Newark and 4 m. below Paterson. It is served by the Erie, the Lackawanna and the New York, Susquehanna and Western railways, interurban trolleys and motor-bus lines. Pop. (1920) 63,541; 1928 est. 71,800. The city has an area of 3·26 sq.m.; an assessed valuation for 1927 of $103,482,677; and a commission form of government. It shares in the water-supply from the Wanaque watershed and empties its sewage into the great Passaic Valley drain. (*See* Newark.) Passaic has long been an important manufacturing centre, with highly diversified industries, and the output of its factories in 1925 was valued at $94,724,897. A settlement was established here by the Dutch in 1679. Until the middle of the 19th century it was called Acquackanonk or Paterson Landing. In 1873 it was chartered as a city. Between 1880 and 1910 the population increased from 6,532 to 54,773, doubling in each of the three decades.

PASSAU, a town and episcopal see of Germany, in the republic of Bavaria, situated at the confluence of the Danube, the Inn and the Ilz, close to the Austrian frontier, 89 m. N.E. from Munich and 74 S.E. of Regensburg by rail. Pop. (1925) 24,428, nearly all being Roman Catholics. On the site of the present Innstadt there was a pre-Roman settlement, *Boiudurum*. Afterwards the Romans established a colony of Batavian veterans, the *castra batava* here. It received civic rights in 1225. The bishopric was founded by St. Boniface in 738 and included until 1468 not only much of Bavaria, but practically the whole of the archduchy of Austria. About 1260 the bishop became a prince of the empire. In 1803 the bishopric was secularized, and in 1805 its lands came into the possession of Bavaria. The area, which was diminished in the 15th, and again in the 18th century, was then about 350 sq.m., and the population about 50,000. A new bishopric of Passau, with ecclesiastical jurisdiction only, was established in 1817.

Passau consists of the town proper, lying on the rocky tongue of land between the Danube and the Inn, and of suburbs, lying along the other rivers. Of the 11 churches, the most interesting is the cathedral of St. Stephen. The two linked fortresses, the Oberhaus and the Niederhaus, are the remains of the fortifications. The former was built early in the 13th century by the bishop in consequence of a revolt on the part of the citizens; the latter is mentioned as early as 737. The chief industries are the manufacture of tobacco, beer, leather, porcelain, machinery, paper, iron founding and the quarrying of graphite and granite. Large quantities of timber are floated down the Ilz. Passau is a tourist centre, and has an important river trade, especially since

the construction of the Rhine-Main-Danube canal.

See W. M. Schmidt, *Gesch. der Stadt Passau* (1928).

PASSCHENDAELE, BATTLE OF, 1917. This protracted operation formed part of the still more prolonged offensive known as and described under *Ypres, Battles of, 1917*. But because of its unhappy significance as the final stage and ultimately the final goal of these operations, the term "Passchendaele Offensive" is often used to denote not merely the part but the whole.

PASSERAT, JEAN (1534–1602), French poet, was born at Troyes, on Oct. 18, 1534. He studied at the university of Paris, and is said to have worked in a mine. He taught at the Collège de Plessis, and was made professor of Latin in 1572 in the Collège de France. Passerat composed much agreeable poetry in the Pléiade style, the best being his short ode *Du Premier jour de mai,* the charming villanelle, *J'ai perdu ma tourterelle,* and the famous political song, *Sur la journée de Senlis.* His share in the *Satyre ménippée* (Tours, 1594), the manifesto of the *politique* or Moderate Royalist party when it had declared itself for Henry of Navarre, is doubtful. He died in Paris on Sept. 14, 1602.

See a notice by P. Blanchemain prefixed to his edition of Passerat's *Poésies françaises* (1880). Among his Latin works should be noticed *Kalendae januariae et varia quaedam poemata* (2 vols., 1606), addressed chiefly to his friend and patron Henri de Mesmes. For the *Satyre ménippée* see the edition of Charles Read (1876).

PASSERES or **PASSERIFORMES,** the largest order of birds, containing most of the highest forms. They are the true perching birds, with three toes directed forwards and one backwards; the latter is long and is moved by a separate tendon from that moving the front ones. There are between 5,000 and 6,000 species, mostly small birds; they fall into two sections, the Mesomyodi, with a simple syrinx (*see* Song in Birds) and hence songless, and the Acromyodi with a complex syrinx and including all the true song-birds, besides others. In size, passerines range from the minute wrens, sun-birds and flower-peckers (*qq.v.*) to the relatively large crows and birds of paradise (*qq.v.*). The order includes songsters such as the nightingale, mocking-bird, bulbul, skylark, song and hermit thrushes and brilliantly coloured forms such as the cocks of the rock, birds of paradise, the cardinals, pittas, etc. (*See* Ornithology, Bird.)

PASSION, a term used in two main senses: (1) the suffering of pain, and (2) feeling or emotion. The first is chiefly used of the suffering of Jesus Christ, extending from the time of the agony in the garden until His death on the Cross. In this sense, *passio* (late Lat.), was used by the early Christian writers, and the term is also applied to the sufferings and deeds of saints and martyrs. Passion Week is the name given to the fifth week in Lent, beginning with Passion Sunday. One of the earlier forms of oratorio, developed from the ancient church usage of reciting in Holy Week the story of the Passion, to appropriate plain-song music.

PASSION-FLOWER (*Passiflora*), the typical genus of the family Passifloraceae, to which it gives its name. The name passion-flower—*flos passionis*—arose from the supposed resemblance of the corona to the crown of thorns, and of the other parts of the flower to the nails, or wounds, while the five sepals and five petals were taken to symbolize the ten Apostles—Peter, who denied, and Judas, who betrayed, being left out of the reckoning. There are about 300 species, mostly natives of western tropical South America; others are found in various tropical and sub-tropical districts of both hemispheres. The tacsonias, by some considered to form part of this genus, inhabit the Andes at considerable elevations. They are mostly climbing plants having a woody stock and herbaceous or woody branches, from the sides of which tendrils are produced. Some few form trees of considerable stature destitute of tendrils, and with broad magnolia-like leaves in place of the more or less palmately-lobed leaves which are most generally met with in the family.

The inflorescence is usually of a cymose character. The flower consists of a receptacle varying in form from that of a shallow saucer to that of a long cylindrical or trumpet-shaped tube, and giving off from its upper border the five sepals, the five petals (rarely these latter are absent), and the threads or membranous processes constituting the "corona." This corona forms the most conspicuous and beautiful part of the flower of many species, and consists of outgrowths from the tube formed subsequently to the other parts; it is physiologically useful in favouring the cross-fertilization of the flower by means of insects. From the base of the inner part of the tube of the flower, but quite free from it, uprises a cylindrical stalk surrounded below by a small cup-like outgrowth, and bearing above the middle a ring of five flat filaments each attached by a thread-like point to an anther. Above the ring of stamens is the ovary itself, upraised on a prolongation of the same stalk which bears the filaments, or sessile. The stalk supporting the stamens and ovary is called the "gynophore" or the "gynandrophore," and is a characteristic of the family.

FROM BAILLON, "HISTOIRE DES PLANTES" (COPR. H BONNAIRE)

PASSION-FLOWER (PASSIFLORA CERULEA), SHOWING (A) FLOWERS AND CLIMBING HABIT, (B) LONGITUDINAL SECTION THROUGH THE FLOWER

The ovary of passion-flowers is one-celled with three parietal placentas, and bears at the top three styles, each terminating by a large button-like stigma. The ovary ripens into a berry-like, very rarely capsular, fruit with the three groups of seeds arranged in lines along the walls, but imbedded in a pulpy arillus derived from the stalk of the seed. This succulent berry is in some cases highly perfumed, and affords a delicate fruit for the dessert-table, as in the case of the "granadilla" *P. quadrangularis,* also *P. edulis, P. macrocarpa,* and various species of *Tacsonia* known as "curubas" in Spanish South America; *P. laurifolia* is the water-lemon, and *P. maliformis* the sweet calabash of the West Indies. The fruits do not usually exceed in size a hen's or a swan's egg, but that of *P. macrocarpa* is a gourd-like oblong fruit attaining a weight of 7 to 8 pounds.

In the United States about 10 native species of *Passiflora* occur, chiefly in the South and South-west. The passion-vine (*P. incarnata*), climbing 10 to 30 ft. high, with pink and white flowers and a yellow, berry-like, edible fruit, 2 in. long, is found from Virginia to Missouri south to Florida and Oklahoma. The yellow passion-flower (*P. lutea*), of similar range, is a smaller plant, with greenish-yellow flowers and purple fruit.

The tacsonias, which in cultivation are often regarded as distinct, differ from *Passiflora* in having a long cylindrical calyx-tube, bearing two crowns, one at the throat, the other near the base; they are stove or greenhouse plants; *T. pinnatistipula,* with pale rose-coloured flowers, a native of Chile and Peru, has long been in cultivation; *T. Van-Volxemii* and *T. manicata,* with handsome scarlet flowers, are among the finest species.

PASSIONISTS, a congregation of men of the Roman Catholic Church comprising priests, seminarists and lay auxiliaries. Its official title is The Congregation of the Discalced Clerks of the most Holy Cross and Passion of our Lord Jesus Christ. It was founded by St. Paul of the Cross whose name was Paul Francis Daneo. He was born at Ovado, Italy, Jan. 3, 1694; died at Rome, Oct. 18, 1775; and was canonized, June 29, 1867. The Passionists were established at Castelazzo, Italy, 1720.

The Passionist congregation endeavours to unite the active and the contemplative forms of the religious life. Passionists take the three customary vows of poverty, chastity and obedience to which a fourth is added, that of promoting in the hearts of the faithful a devotion to the Passion and Death of Jesus Christ. The vows made are *simple,* not *solemn,* and are perpetual from their final profession. Their houses are not endowed, although

they are allowed to possess in common, buildings with a few acres of land attached.

During the lifetime of St. Paul of the Cross 12 houses of his institute were established in Italy and this number was greatly augmented during the ensuing years until 1810, when, by the order of Napoleon, they were suppressed together with all other religious institutions. From the time of the restoration of the congregation under Pius VII., the institute has spread throughout the world. At present houses of the congregation are found in Italy, France, Germany, Austria, England, Scotland, Ireland, Spain, Holland, Belgium, Poland, United States, Canada, Mexico, Colombia, Cuba, Argentine, Chile, Peru, Brazil, Australia, China, Rumania and Bulgaria.

See Father Pius, *The Life of St. Paul of the Cross* (Dublin, 1868); Felix Ward, *The Passionists* (Benziger, New York, 1923).

PASSOVER, a spring festival celebrated by the Jews in commemoration of the Exodus from Egypt by a family feast in the home on the first evening, and by abstaining from leaven during the seven days of the feast. According to tradition, the first Passover ("the Passover of Egypt") was preordained by Moses at the command of God. The Israelites were commanded to select on the tenth of Abib (Nisan), a he-lamb of the first year, without blemish, to kill it on the eve of the fourteenth, and to sprinkle with its blood the lintel and side post of the doors of their dwellings so that the Lord should "pass-over" them when he went forth to slay the first-born of the Egyptians. The lamb thus drained of blood was to be roasted and entirely consumed by the Israelites, who should be ready with loins girded, shoes on feet and staff in hand so as to be prepared for the Exodus. In memory of this the Israelites were for all time to eat unleavened bread (Mazzoth) for seven days, as well as keep the sacrifice of the Passover on the eve between the fourteenth and the fifteenth of Nisan. This evening meal was not to be attended by any stranger or uncircumcised person. "On the morrow of the Sabbath" a wave-offering of a sheaf of barley was to be made.

Various theories have been from time to time proposed to account for this complex of enactments. J. Spencer in his *De legibus Hebraeorum* (1685) saw in the Passover a practical protest against the Egyptian worship of Apis. Vatke considered it a celebration of the spring solstice, Bauer a means of removing the impurity of the old year. Lengerke recognized a double motive: the lamb for atonement, the unleavened bread as a trace of the haste of the early harvest. Ewald regarded the Passover as an original pre-Mosaic spring Festival made to serve the interest of purity and atonement.

Investigations based on minute literary analysis of the Pentateuch, were begun by Graf, continued by Kuenen, and culminated in the work of Wellhausen and Robertson Smith. The modern view claims to determine the respective ages and relative chronological position of the various passages in which the Passover is referred to in the Pentateuch, and assumes that each successive stratum represents the practice in ancient Israel at the time of composition, laying great stress upon the omissions as implying non-existence. The main passages and their contents are arranged chronologically in the following way:—

A. In the Elohist Book of the Covenant (Exod. xxiii.).
B. In the Yahwist Source (Exod. xxxiv. 18–21, 25).
C. In the Yahwistic History (Exod. xii. 21–27, 29–36, 38–39, xiii. 3–16).
D. The Deuteronomist (Deut. xvi. 1–8, 16–17).
E. In the Holiness Code (Lev. xxiii. 4–8, 9–14).
F. In the Priestly History (Exod. xii. 1–20, 28–31, xiii. 1–2).
G. In the Secondary Sources of the Priestly Code (Exod. xii. 40–41, 43–50, ix. 1–14, xiv. 16–25).

Many discrepancies have been observed by critics in the different portions of this series of enactments. Thus in the Elohist and in Deuteronomy the date of the festival is only vaguely stated to be in the month of Abib, while in the Holiness Code and in the Priestly History the exact date is given and so on.

As regards the character and significance of the two feasts it may be noted that the Passover (Nisan 15) is taken back to the beginning of the national history. It originally connoted a pastoral feast celebrating the birth of the lambs. It goes back to the desert period, whereas the Feast of Unleavened Bread is an agricultural observance and cannot have been practised before the entry into Palestine. The "sheaf of first-fruits of your harvest" mentioned in Lev. xxiii. 10, is associated in Jewish tradition with the barley harvest (Mishna, *Menachoth* x.).

The folk-etymology of the word Passover given in Exod. xii. 23 seems to connect the original of the feast with a threshold covenant (*see* Trumbull, *Threshold Covenant,* 1902); the daubing of the side-posts and lintel with blood at the original Passover, which finds its counterpart in Babylonian custom (Zimmern, *Beit. z. Bab. Rel.* ii. 126–7) and in Arabic usage (*Wakidi,* ed. Kremer, p. 28), implies a blood covenant.

The feast is connected both in later Jewish tradition and among the Samaritans with the sacro-sanctity of the first-born. Hebrew tradition further connects the revelation of the sacred name of the God of the Hebrews with the festival, and thus connects it with the Exodus, the beginning of the theocratic life of the nation. There seems no direct connection between the Paschal sacrifice and an agricultural festival; the Hebrew tradition, to some extent, dissociates them by making the sacrifice on 14th of Nisan and beginning the Feast of Unleavened Bread on 15th.

Wellhausen and Robertson Smith suggested that the Passover was, in its original form, connected with the sacrifice of the firstlings, and the latter points to the Arabic annual sacrifices called *'atair,* which some of the lexicographers interpret as firstlings. These were presented in the month of Rajab, corresponding to Nisan (Smith, *Religion of Semites*). But the real Arabic sacrifice of firstlings was called *fara;* it might be sacrificed at any time, as was also the case with the Hebrews (Exod. xxii. 30). The paschal lamb was not necessarily a firstling, but only in the first year of its life (Exod. xii. 5). The suggestion of Wellhausen and Robertson Smith confuses the offering of firstlings (Arabic *fara*) and that of the first yearlings of the year in the spring (Arabic *'atair*). It is possible that the Passover was originally connected with the latter (*cf.* Wellhausen, *Reste arab. Heidentums*). As regards the feast of Unleavened Bread, now indissolubly connected with the Paschal sacrifice, no satisfactory explanation has been given either of its original intention or of its connection with the Passover. It has been suggested that it was originally a *ḥag* (*ḥajj*) or pilgrimage feast to Jerusalem, of which there were three in the year connected with the agricultural festivals (Exod. xxxiv. 17 *seq.*). But the real agricultural occasion was not the eating of unleavened bread but the offering of the first sheaf of the barley harvest on the "morrow of the Sabbath" in the Passover week (Lev. xxiii. 10 *seq.*). This occasion determined the second agricultural festival, the Feast of Weeks, fifty days later (Deut. xvi. 9; Lev. xxiii. 16; *see* PENTECOST). It still remains possible therefore, that the seven days' eating of unleavened bread (and bitter herbs) is an historical reminiscence of the incidents of the Exodus where the normal commissariat did not begin until a week after the first exit. On the other hand, the absence of leaven may recall primitive practice before its introduction as a domestic luxury.

According to Robertson Smith, the development of the various institutions connected with the Passover was as follows. In Egypt the Israelites, as a pastoral people, sacrificed the firstlings of their flocks in the spring, and, according to tradition, it was a refusal to permit a general gathering for this purpose that caused the Exodus. When the Israelites settled in Canaan they found there an agricultural festival connected with the beginnings of the barley harvest, which coincided in point of date with the Passover and was accordingly associated with it. At the time of the reformation under Josiah, represented by Deuteronomy, the attempt was made to turn the family thank-offering of firstlings into a sacrificial rite performed by the priests in the Temple with the aid of the males of each household, who had to come up to Jerusalem but left the next morning to celebrate the Feast of Unleavened Bread in their homes. During the exile this was found impossible, and the old home ceremonial was revived and was kept up even after the return from the exile. There appears to have been at first considerable variety in the mode of keeping the Passover, but the earliest

mention in the historical narratives (Josh. v. 11) connects the Paschal sacrifice with the eating of unleavened bread.

At any rate the Samaritans have throughout their history observed the Passover with all its Pentateuchal ceremonial and still observe it down to the present day. They sacrifice the paschal lamb, which is probably the oldest religious rite that has been continuously kept up. In two important points they differ from later Jewish interpretation. The term "between the evenings" (Lev. xxiii. 5) they take as the time between sunset and dark, and "the morrow of the Sabbath" (v. 11) they take literally as the first Sunday in the Passover week; wherein they agree with the Sadducees, Boethusians, Karaites and other Jewish sectaries. The Paschal Lamb is no longer eaten, but represented by the shank bone of a lamb roasted in the ashes; unleavened bread and bitter herbs (*haroseth*) are eaten; four cups of wine are drunk before and after the repast, and a certain number of Psalms are recited.

The Passover among the Jews is regarded as the Festival of Freedom. It seems probable in any case that the ritual of the Mass has grown out of that of the Passover service (*see* Bickell, *Messe und Pascha*, trans. W. F. Skene, Edinburgh, 1891). Up to the Nicene Council the Church kept Easter (*q.v.*) coincident with the Jewish Passover, but after that period took elaborate precautions to dissociate the two.

BIBLIOGRAPHY.—The commentaries on Exodus and Leviticus; that of Kalisch on the latter book (vol. ii., London, 1871) anticipates much of the critical position. The article in Winer's *Bibl. Realwörterbuch* gives a succinct account of the older views. A not altogether unsuccessful attempt to defend the Jewish orthodox position is made by Hoffmann in his *Commentary* on Leviticus (Berlin, 1906). Wellhausen's views are given in his *Prolegomena*. A critical yet conservative view of the whole question is given by R. Schaefer, *Das Passah-Mazzoth-Fest* (Gutersloh, 1900) which has been partly followed above. For the general attitude towards the comparative claims of institutional archaeology and literary criticism adopted above *see* J. Jacobs, *Studies in Biblical Archaeology* (London, 1895). *See* also I. Abrahams, *Annotated Jewish Prayer Book* (London, 1914), and Oesterley, *Jewish Background of the early Christian liturgy* (London, 1926).

(J. JA.; G. H. B.)

PASSOW, FRANZ LUDWIG CARL FRIEDRICH (1786–1833), German classical scholar and lexicographer, was born at Ludwigslust in Mecklenburg-Schwerin on Sept. 20, 1786, was professor of ancient literature at Breslau, and died there on March 11, 1833. He aroused great opposition by his advocacy of gymnastic exercises. Passow's great work was his *Handwörterbuch der griechischen Sprache* (1819–24), originally a revision of J. G. Schneider's lexicon, which appeared in the fourth edition (1831) as an independent work, without Schneider's name (new ed. by Crönert, 1901). It formed the basis of Liddell and Scott's lexicon.

See L. and A. Wachler, *Franz Passow's Leben und Briefe* (1839), which contains a full bibliography.

PASSPORT, or safe-conduct in time of war, a document granted by a belligerent Power to protect persons and property from the operation of hostilities. In the case of the ship of a neutral Power, the passport is a requisition by the Government of the neutral State to suffer the vessel to pass freely with the crew, cargo, passengers, etc., without molestation by the belligerents. A passport is also a document authorizing a person to pass out of or into a country, or a licence or safe-conduct to the person specified therein and authenticating his right to aid and protection. Passports are usually granted by the foreign office of a State, or by its diplomatic agents abroad. They may be granted to naturalized as well as natural-born British subjects.

In the United States, passports are issued by the Department of State at Washington, and, for the benefit of American citizens abroad, where there is no question of their citizenship, at a large number of American consular offices.

See N. W. Sibley, "The Passport System," *Jour. Comp. Leg.* new series, vol. vii.

PASSY, FRÉDÉRIC (1822–1912), French economist and pacifist, was born in 1822 and was a nephew of the economist Hippolyte Passy (1793–1880), finance minister to Louis Philippe and to Louis Napoleon's republican Government. His first work, *Mélanges économiques,* appeared in 1857. He was an ardent free-trader and an admirer of Cobden. In 1867 he founded the Ligue Internationale de la Paix, afterwards known as the Société Française pour l'Arbitrage entre Nations, and devoted himself to the promotion of international peace. From 1881 to 1899 he was deputy for the Seine department. In 1901 he shared the Nobel Peace prize with Dunant. He died in Paris on June 12, 1912.

His published works include *De la Propriété Intellectuelle* (1859), *Leçons d'économie politique* (1860–61); *La Démocratie et l'Instruction* (1864); *L'Histoire du Travail* (1873), *Malthus et sa Doctrine* (1868); *La Solidarité du Travail et du Capital* (1875), and *Le Petit Poucet du XIX^me siècle; George Stephenson* (1881).

PASTEBOARD: *see* CARDBOARD.

PASTEL, the simplest of all methods of laying colour upon a flat surface. The colours used consist practically of the pure powder colours; whereas in other methods, the colours have to be mixed with some medium, the immediate result often being that the tone of the colour is lowered; and even if on drying the original tone is restored, as in fresco (*q.v.*), the artist while at work can only calculate what the picture will look like when dry. In pure pastel as the colour is put on so it remains. The disadvantage of pastel is that its life is precarious, not because its colours are more fugitive than in other methods but because it remains on the surface of the paper, liable, unless protected by glass, to be rubbed off by any chance touch. On the other hand, if certain precautions are observed during the course of applying the colour it is able to resist violent shocks, even if ordinary powder colour is applied direct; as it may be at times.

Pastels are made up into cylinders or pencils with the least amount of adhesive (a gum) necessary to hold the particles of colour together in the lightest possible manner, so that a touch of the pencil on the surface of the paper leaves an impression. Pastels, as sold by the modern dealer, are usually arranged in a series of tones, the darkest pencil consisting of the pure colour; all the other pencils of the series are mixed with white to a greater and greater degree as they ascend the scale toward the lightest. Thus the artist has a certain number of tones ready to use at once. The white used is either precipitated chalk or pipe-clay. Pastels can be applied to any paper but some seem to hold the powdered colour much better than others. The paper may be of any colour.

If white paper is decided upon, a good one is a medium "Whatman," but even here the papers of different years vary considerably, and if the artist finds one he likes he will be wise to lay in a considerable stock as he may find it impossible to buy exactly the same again. He should also avoid certain papers of almost a felt-like character, which take up a considerable amount of powder and are liable to shed it again on very slight provocation. It is a curious thing that this powder will adhere to a comparatively smooth surface, so long as the artist, while at work on the picture, blows, at intervals, the superfluous powder away, and, occasionally, taps the back of the board upon which the paper is laid. Pastels should not be done upon canvas or sand paper.

Pastel can be applied as a pencil, *i.e.*, by means of lines or short touches, or it may be rubbed. By far the best way of rubbing pastel is with the pad of the tip of the finger; if stumps are used they are apt to remove most of the powder. Speaking generally pastel should not be fixed, the use of the fixatives at once alters its character; it is converted into a painting and all the tones are lowered, and the beauty of the surface is at once destroyed. It becomes like a butterfly's wing dipped in water. No fixative is satisfactory, but one, which serves its purpose, is a weak solution of parchment, size and water blown on with a spray diffuser from a considerable distance.

Sometimes a very little fixative may be used in the early stage as this prevents a heaping up of the powder, the fixative making what is there firmly and thinly adhere to the paper, but the final touches must be pure pastel. It is easy by loading pastel upon the paper to reach the end of the possibility of this method, therefore, above all, the artist must learn to apply the powder very thinly and to keep the colours as much as possible clear and defined. A dirty mess is the end of a good many pastels.

Pastel has most distinctly a character of its own and should be used with an understanding of what it can do and what it cannot do. It should not be used to imitate oil-painting which it certainly cannot do without entirely altering its natural character.

It should be considered as a method of applying colour, which owing to the practical absence of a medium is higher in tone than in any other method, thinly to the surface of the paper so that as in water-colour the actual paper itself may occasionally play a part in the design. With this knowledge of its proper use, very beautiful results can be obtained. It is an excellent method to use when a portrait is required, but better for small portraits than large; a life-sized head in pastel is seldom satisfactory and generally becomes overloaded with colour. It cannot pretend to the carrying power of oil-painting; it may be described as a more humble medium and, therefore, is not to be employed in large designs. (H. To.)

HISTORY

The invention of pastel, which used to be generally called "crayon," has frequently been accredited to Johann Alexander Thiele (1685–1752), landscape-painter and etcher of distinction, as well as to Mme. Vernerin and Mlle. Heid (1688–1753), both of Danzig. But the claim cannot be substantiated, as drawing in coloured chalks had been practised long before, *e.g.*, by Guido Reni (1575–1642), by whom a head and bust in this manner exists in the Dresden Gallery. Thiele was perhaps the first to carry the art to perfection, but his contemporary, Rosalba Carriera of Venice (1675–1757), is more completely identified with it. The Dresden Museum contains 157 examples of her work in this medium, portraits, subjects and the like. Thiele was followed by Anton Raphael Mengs (1728–1779) and his sister Theresia Mengs (afterwards Maron, 1725–1806), and by Johann Heinrich Schmidt (1749–1829).

Holbein, Watteau, Boucher, Greuze, John Raphael Smith and Sir Thomas Lawrence all made use of the coloured chalk. In 1747 Nattier (1685–1766) showed a pastel portrait of M. Logerot in the Paris Salon, and his son-in-law, Louis Tocqué (1696–1772), soon followed with similar work. Hubert Drouais (1699–1767) had preceded his rival Nattier in the Salon by a single year with five pastel portraits, and Chardin (1699–1779) followed in 1771. This great master set himself to work in emulation of Quentin de la Tour (1704–1788), who in spite of the ability of his rivals may be regarded as the most eminent pastellist France has produced. His full strength as a portrait-pastellist is to be gauged in the collection of eighty-five of his principal works now in the museum of St. Quentin. Then followed Simon Mathurin Lantara (1729–1778), who was one of the first to paint pastel-pictures of landscapes.

Two Swiss painters had considerable influence in spreading the use of pastel—the experimentalist Dietrich Meyer (1572–1658), one of the first to make designs in coloured chalks (and reputed inventor of soft-ground etching), and Jean Étienne Liotard (1702 or 1704–1788), one of the most brilliant pastellists who ever lived. Two of his works are world-famous, "La Belle Chocolatière de Vienne," executed in 1745, now in the Dresden Museum, and "La Belle Liseuse" of the following year at the museum at Amsterdam. The latter is a portrait of his niece, Mlle. Lavergne.

Crayon-painting was practised in England at an early date, and John Riley (1646–1691), many of whose finest works are attributed to Sir Peter Lely, produced numerous portraits in that medium. Francis Knapton (1698–1778), court painter, was a more prolific master, and he, with William Hoare of Bath (?1707–1792) who had studied pastel in Italy, prepared the way for the triumph of Francis Cotes (?1725–1770). Then for the first time pastel-painting was fully developed by an English hand. Before he became a painter in oil Cotes had worked under Rosalba Carriera, and, although he was rather cold and chalky in his tones, he produced portraits, such as his "Mr. and Mrs. Joah Bates" and "Lord Hawke," which testify to his high ability. He was, however, far surpassed by his pupil, John Russell, R.A. (1745–1806), who brought the art to perfection, displaying grace and good expression in all his pastel work, whether portrait, fancy picture, historical subject, group, or "conversation-piece." Romney (1734–1802) in his single pastel portrait, a likeness of William Cowper the poet, showed that he might have excelled in this medium, which, indeed, was particularly suited to his tender manner. Hugh D. Hamilton (*c.* 1734–1806) of the Royal Hibernian Academy, Ozias Humphry, A.R.A. (1742–1810), Richard Cosway, R.A. (1742–1821) and his wife Maria Cosway (1759–1838) are among the better known English pastellists. Daniel Gardner (?1750–1805), whose pictures in oil have often been mistaken for Reynolds's and Gainsborough's, gave rein to his exuberant fancy and his rather exaggerated taste in compositions. Gardner marked the deterioration of the art, which thereafter declined, Henry Bright (1814–1873) being almost the only pastellist of real power who followed him. Bright's landscapes have probably in their own line never been surpassed.

Since 1870 there has been a revival of the art of pastel, the result of a better understanding and appreciation on the part of the public. The art of pastel, as M. Roger Ballu expressed it, "was slumbering a little," until in 1870 the Société des Pastellistes was founded in France and met with ready appreciation. With many artists it was a matter of "coloured chalks," as, for example, with Millet, Lhermitte and Degas in France, and with Whistler in England. With the majority the full possibilities were seized, and a great number of artists abroad then practised the art for the sake of colour, among whom may be mentioned Adrien Moreau, A. Besnard, Émile Lévy, Machard, Pointelin, Georges Picard, de Nittis, Iwill, René Billotte, Jozan, Nozel, Raffäelli, Brochard (mainly upon vellum) and Lévy-Dhurmer in France; in Belgium, Émile Wauters (who has produced a great series of life-sized portraits of both men and women of amazing strength, vitality and completeness) and Fernand Khnopff; in Italy, C. Laurenti, P. Fragiacomo and Giovanni Segantini; in Holland, Josselin de Jong; in Germany, F. von Lenbach, Max Liebermann and Franz Stück; and in Norway, Fritz Thaulow.

America has also been closely identified with the revival of the art. Among the American painters who have been successful in the use of pastel are: August Renoir, Mary Cassatt, Thomas W. Dewing, Robert Blum, Jerome Myers, W. J. Glackens, Albert Sterner, Everett Shinn, J. Wells Champney and James Alden Weir.

In England the revival of pastel dates from 1880, when the first exhibition of the Pastel Society was held in the Grosvenor Gallery. The exhibition was a *succès d'estime*, but after a while the society languished until, in 1899, it was reconstituted, and obtained the adhesion of many of the most distinguished artists practising in the country, as well as of a score of eminent foreign painters. In that year, and since, it has held exhibitions of a high order; and intelligent public appreciation has been directed to the work of the most noteworthy contributors. Among these are E. A. Abbey, R.A.; M'Lure Hamilton, J. M. Swan, R.A.; J. Lorimer, R.S.A.; A. Peppercorn, R. Anning Bell, J. J. Shannon, R.A.; Sir James Guthrie, P.R.S.A.; H. Brabazon, Walter Crane, Melton Fisher, Edward Stott, A.R.A.; S. J. Solomon, R.A.; and W. Rothenstein.

See Karl Robert [Georges Meusnier], *Le Pastel* (Laurens, Paris, 1890); J. L. Sprinck, *A Guide to Pastel Painting* (Rowney, London); Henry Murray, *The Art of Painting and Drawing in Coloured Crayons* (Winsor and Newton, London). Among early works are: John Russell, R.A., *Elements of Painting with Crayons* (1776); M.P.R. de C.C., *Traité de la peinture au pastel avec les moyens de prévenir l'altération des couleurs* (Paris, 1788); Rosalba Carriera, *Diario degli anni 1720 e 1721 scritto di propria mano in Parigia*, etc. (Giovanni Vianelli, Venice, 1793, 4to); Girolamo Zanetti, *Elogio di Rosalba Carriera, pittrice* (*Venice*, 1818, 8vo). *See* also Henri Lapauze, *Les Pastels de M. Quentin de la Tour à St. Quentin*, preface by Gustave Larroumet (Paris); George C. Williamson, *John Russell, R.A.* (London, 1894). (M. H. S.)

PASTEUR, LOUIS (1822–1895), French chemist, was born on Dec. 27, 1822, at Dôle, Jura, the son of a tanner. Shortly afterwards his family moved to Arbois, where Louis attended the primary and secondary schools. In Oct. 1838 he was sent to a school in the Quartier Latin of Paris, preparatory to the École normale, but his health broke down and he yearned for home. "If only I could smell the tannery once more," said he, "I should feel well." He was allowed to return to Arbois, but soon left to enter the Royal College of Besançon, where in 1840 he won his "bachelier ès lettres." He then became assistant mathematical master in the college, securing in 1842 the "baccalauréat ès sciences" with "mediocre" in chemistry attached to his diploma. Even in these

EXAMPLES OF PASTEL

1. Self-portrait by Quentin de La Tour (1704–1788), French. 2. "Portrait of a Lady with Flowers in her Hair" by Rosalba Carriera (1675–1757), Italian. 3. "The Ballet Dancer" by Henri Matisse (1869–), French. 4. "Auguste Rodin" by Henry Tonks (1862–), English. 5. "The Violet Note" by J. A. M. Whistler (1834–1903), American. In the Isabella Stewart Gardner Collection, Boston. 6. "The Toilet" by Hilaire G. E. Degas (1834–1917), French. 7. "Lapis Lazuli" by J. A. M. Whistler (1834–1903), American. In the Isabella Stewart Gardner Collection, Boston

early days the dominant note in Pasteur's life was sounded. To his sisters he writes: "These three things, will, work and success, between them fill human existence." Throughout his entire life, work was his constant inspiration. On his deathbed he turned to his devoted pupils and exclaimed: "Oú en êtes-vous? Que faites-vous?" ending with his favourite words, "Il faut travailler."

In 1843 Pasteur was admitted fourth on the list to the École normale. He now attended the lectures of J. B. Dumas at the Sorbonne, and thereby received his first incentive to the serious study of chemistry. Shortly afterwards, to his great joy, he became laboratory assistant to A. J. Balard In 1848, having been successful at the examinations for the *licence,* the *agrégation* and the doctorate, he accomplished his first startling piece of research, on racemic acid. Mitscherlich had shown in 1844 that the ordinary commercial acid rotated the plane of polarized light to the right, while the paratartrate or racemic acid possessed no rotary power. Being interested in crystals, Pasteur soon realized that the paratartrate contained two types of crystals. He separated them and found that their solutions when tested with a polariscope gave two contrary deviations. He then mixed an equal number of each kind and was able to procure the desired optical neutrality of racemic acid Thus he had proved that this mysterious acid was made up of a right-hand tartaric acid and a left-hand one, and had incidentally discovered a new class of isomeric substances. (*See* ISOMERISM.)

In the autumn of 1848 Pasteur moved to Dijon as professor of physics, but in the beginning of the following year was transferred as professor of chemistry to Strasbourg, where he soon married Mlle Laurent, who proved herself a devoted and noble helpmeet. While at Strasbourg he was awarded the ribbon of the Legion of Honour for having artificially produced from the ordinary commercial acid that racemic acid which up to then had only once been produced, and that by accident. Pasteur's appointment in 1854 as professor and dean of the new Faculté des sciences at Lille placed him in a district where his interest in fermentation could be applied to the manufacture of alcohol from grain and beet-sugar, and his energies were now bent towards discovering the causes of the diseases of beer and wine On examining the yeasts of sound and unsound beer under the microscope, he at once saw that the globules of the sound beer were nearly spherical, whilst those of the sour beer were elongated. He continued his researches, and, after his removal in 1857 to the École normale as director of scientific studies, definitely proclaimed that fermentation is the result of minute organisms, and that when a fermentation failed, either the necessary organism was absent or unable to grow properly Hitherto all explanations of the phenomenon of fermentation had been obscure and without experimental foundation, but Pasteur supported his contention by showing that milk could be soured by injecting a number of the organisms from buttermilk or beer kept unchanged if similar organisms were excluded. "The chemical act of fermentation," wrote Pasteur, "is essentially a correlative phenomenon of a vital act beginning and ending with it." (*See* FERMENTATION.)

The recognition of the fact that both lactic and alcohol fermentations were hastened by exposure to air naturally led Pasteur to wonder whether his invisible organisms were always present in the atmosphere or whether they were spontaneously generated By a series of intricate experiments, including the filtration of air and the famous exposure of unfermented liquids to the pure air of the high Alps, he was able to declare with certainty in 1864 that the minute organisms causing fermentation were not spontaneously generated, but came from similar organisms with which ordinary air was impregnated. Pasteur was now acknowledged the leading chemist of his day and the recipient of honours both from his own country and abroad Lord Lister, who saw the applicability of these discoveries to surgery, was able to revolutionize surgical practice by utilizing in 1865 carbolic acid to exclude the atmospheric germs and thus prevent putrefaction in compound fractures.

In June 1865, after much persuasion from his old teacher, J. B. Dumas, Pasteur went to the south of France to investigate the disease of silkworms which was ruining the French silk industry. (*See* SILK.) Three years later he was able to announce that he had isolated the bacilli of two distinct diseases and that he had found a method of preventing contagion as well as of detecting diseased stock. These results not only saved the prosperity of the French silk industry but that of all silk-producing countries. In the October of 1868 Pasteur was struck with semi-paralysis, but he was able to return to Paris and continue his experiments on fermentation. The war of 1870 made him more desirous than ever of devoting himself to the perfecting of French brewing In 1872 he wrote his famous paper on fermentation, and in 1873 he became a member of the French Academy of Medicine In 1874 he received a life-pension from the National Assembly. Three years later Pasteur, who had already revolutionized the production of alcohols, established the germ theory and saved the silk industry, turned his attention to the fatal cattle scourge known as anthrax, and within two years had demonstrated the entire natural history of the disease. In 1880, however, his researches were diverted to chicken cholera, an epidemic which destroyed 10% of the French fowls. He was soon able to isolate the germ of this disease, and by cultivating an attentuated form of the germ and inoculating fowls with the culture, he proved that they were rendered immune from virulent attacks of cholera. He now returned to his researches on anthrax, a disease upon which Davaine and Koch had been working Following the same methods that he had used in cholera, he isolated the bacillus, and by cultivating it in oxygen at a temperature of 42°C produced a successful inoculation material which, by inducing a mild attack of anthrax, rendered the inoculated animal immune for a time against a culture of full strength. These methods Pasteur called vaccination, because of his desire to render homage to Jenner, who had discovered means for protecting man against smallpox by inoculating with cowpox. (*See* ANTHRAX and VACCINATION.) As to the money values of these discoveries, which had brought Pasteur world fame, T. H. Huxley expressed the opinion that it was sufficient to cover the whole cost of the war indemnity paid by France to Germany in 1870. He himself chose to remain poor and to set an example of simplicity.

Perhaps the most interesting of Pasteur's investigations concerned the curative and preventive treatment of hydrophobia in man and of rabies in dogs After prolonged experiments with inoculations of saliva from infected beings, he came to the conclusion that the virus had its seat in the nerve centres, and demonstrated that a portion of the matter of the spinal column of a rabid dog when injected into the body of a healthy animal produced the symptoms of rabies. By further work on the dried tissues of infected animals and the effect of time and temperature on these tissues, he was able to obtain a weakened form of the bacillus which could be used for inoculation On July 6, 1885, Pasteur was bold enough to inoculate a human being, a child who had been badly bitten by an infected dog The experiment was so successful that by Nov 1888 the Institut Pasteur was founded Thousands suffering from hydrophobia have been treated there and the mortality from this disease has been reduced to less than 1%. (*See* HYDROPHOBIA.) At the inauguration of the institute, Pasteur closed his oration with the following words.—

"Two opposing laws seem to me now in contest. The one, a law of blood and death, opening out each day new modes of destruction, forces nations to be always ready for the battle. The other, a law of peace, work and health, whose only aim is to deliver man from the calamities which beset him. The one seeks violent conquests, the other the relief of mankind. The one places a single life above all victories, the other sacrifices hundreds of thousands of lives to the ambition of a single individual. The law of which we are the instruments strives even through the carnage to cure the wounds due to the law of war. Treatment by our antiseptic methods may preserve the lives of thousands of soldiers Which of these two laws will prevail, God only knows But of this we may be sure, that science, in obeying the law of humanity, will always labour to enlarge the frontiers of life."

Rich in years and in honours, this simple and devout Catholic, this great human benefactor, whose scientific acumen and profound sagacity enabled him to solve the problems of the world of the infinitely small (as he called it), passed quietly away

near St. Cloud on Sept. 28, 1895.

See *Oeuvres de Pasteur,* ed. by P. Vallery-Radot, 2 vols. (1922); René Vallery-Radot, *Vie de Pasteur,* Eng. trans. by Mrs. R. L. Devonshire (1919); L. Descour, *Pasteur and his work,* Eng. trans. by A. F. Wedd (1922) and E. Duclaux, *Pasteur, the History of a Mind,* Eng. trans. by E. F. Smith (Philadelphia, 1920).

PASTO, a city of Colombia and capital of the department of Nariño, about 36 m. from the boundary line with Ecuador, on one of the inland trade routes with that republic, and on a principal line of communication with the great forested regions of the Caquetà (Japurà), Putumayo and Napo. Pop. (1918) 29,035. It stands on an elevated plain, 8,347 ft. above the sea, at the eastern foot of the Pasto volcano, which rises above the city to a height of 13,990 feet. Wool is produced to some extent and is woven for the local market in the woollen factories of Pasto.

PASTON LETTERS, an invaluable collection of the correspondence of the Paston family and others, from 1422 to 1509, including State-papers and other documents. Most of these were sold by the 2nd earl of Yarmouth, the last representative of the family, to the antiquary Le Neve early in the 18th century. On his death in 1729 they were acquired by Thomas Martin of Palgrave, who married Le Neve's widow; and on Martin's death in 1771 they were purchased by John Worth of Diss, whose executors sold them to John Fenn of East Dereham. In 1787 Fenn published two volumes of selections, the originals of which he presented to George III.; in 1789 he issued two more volumes, and when he died in 1794 had prepared a fifth, which was issued in 1823 by his nephew Serjeant Frere. The originals unfortunately all disappeared; and some doubt was cast upon the genuineness of the letters, notably by Herman Merivale in the *Fortnightly* (1865). It was, however, defended by James Gairdner in the same periodical, and established within a year by the discovery of the originals of the fifth volume by Frere's son Philip in his house at Dungate, Cambridgeshire. Ten years later those of the third and fourth volumes were found at Roydon Hall, Norfolk, the chief seat of the Freres; and in 1889 the originals of the remaining two (those presented to George III.) were unearthed at the seat of Captain E. G. Pretyman. It is probable that they had been given to Bishop Pretyman Tomline, friend and tutor of William Pitt.

Among these discoveries were many documents not printed by Fenn; and there are still others. When the 2nd earl of Yarmouth died in 1732 many papers referring to his family were found at his seat, Oxnead Hall. Some of these came into the hands of the Rev. Francis Blomefield, who meant, but failed, to unite his collection with that of Martin. This section of the letters was scattered, part being acquired by the antiquary Ives. Most of the documents are now in the British Museum; but some are at Orwell, others in the Bodleian, others at Magdalen college, Oxford, and a few at Pembroke, Cambridge.

In 1872 Gairdner published the first volume of a new edition. Taking Fenn's work as a basis, he included in his three volumes (1872–75) over 400 hitherto unprinted letters and a valuable Introduction. As a supplement he was able to give an account of the Roydon discovery of 1875, and in later editions he printed the Roydon papers in full. Finally, in 1904, he re-edited the whole; and the six volumes of this edition, with their 1,088 documents and most erudite Introduction, are the chief authority on the subject.

The Paston family takes its name from a village about 20 m. N. of Norwich, and the first known member of the family was living there early in the 15th century. This was Clement Paston (d. 1419), a peasant holding about 100 acres. His son William (1378–1444), to whom Clement had given an excellent legal education, and who is described as "a right cunning man in the law," became in 1429 a justice of the common pleas. He bought land in Norfolk, some of it in Paston, and improved his position by his marriage with Agnes (d. 1479), heiress of Sir Edmund Berry of Harlingbury, Hertfordshire. When he died he left a large inheritance to his son John, who was already married to Margaret (d. 1484), daughter of John Mauteby. At this time England was under a weak king, and only the strong man armed could hope to keep his goods. Paston, a lawyer like his father, lived much in London, and many of the most important of the letters are from Margaret to her husband describing the state of affairs in Norfolk. In 1448 Paston's manor of Gresham was seized by Lord Moleyns, and though it was recovered, the owner could obtain no redress. More serious troubles were caused by the ambiguities of the will of Sir John Fastolf (apparently a relative of Margaret), which involved Paston not only in lawsuits, but in actual warfare, with many neighbouring magnates, among whom were the duke of Suffolk and the (3rd) duke of Norfolk. Paston died in 1466, leaving the affair still unsettled, although in 1461 the king and council had decided in favour of his claim. His son Sir John (1442–79) and the dowager Margaret carried on the struggle, which was marked by repeated captures and recaptures of Caister Castle. A peace was patched up by Waynflete, bishop of Winchester, in 1474, and the death of the (4th) duke of Norfolk paved the way for the restoration of Caister; but a fresh dispute arose with the duke of Suffolk. The intricate story is given in full in Gairdner's introduction. Through these quarrels and Sir John's extravagance the lands were much diminished; yet he left a goodly inheritance to his younger brother, whose name was also John (d. 1503). At this point the letters begin to be scanty and uninteresting; but the family still flourished. Robert Paston was created earl of Yarmouth in 1679. His son William died, aged 80, in 1732, leaving no heir; and his titles became extinct.

The *Letters* are of high historic importance, especially for the reign of Henry VI. The weakness of the king had disorganized the whole administration; the succession itself was contested; the great nobles did what was right in their own eyes; and the prevailing discontent found expression in the rebellion of Jack Cade and the Wars of the Roses. The correspondence reveals the Pastons in a great variety of relations, friendly or hostile, with their neighbours; and abounds with illustrations of the course of public events, as well as of manners and morals. Nothing is more remarkable than the acquaintance of educated persons, both men and women, with the law—an acquaintance which they plainly found indispensable.

All editions are superseded by Gairdner's 6 vols. of 1904; but Blomefield and Parkin's *History of Norfolk* (1805–10) may be consulted, and the article *Paston* in *Dict. Nat. Biog.,* where other authorities are quoted. Some references to the 2nd earl of Yarmouth will be found in the *Lives of the Norths* (edit. Jessopp, 1890). (X.; E. E. K.)

PASTORAL, the name given to a certain class of modern literature derived ultimately from the "idyll" of the Greeks, the "eclogue" of the Latins and their 15th century imitator, J. B. Spagnuoli (Mantuanus) and the late Greek romances. It was a growth of humanism at the Renaissance, and its first home was Italy. Pastoral *poetry,* as it appeared in Tuscany in the 16th century, was really an allegorical eclogue and the idyll could be expanded from a single scene into a drama. The first dramatic pastoral which is known to exist is the *Favola di Orfeo* of Politian, which was represented at Mantua in 1472. But this poem led the way rather to tragedy than to pastoral, and it is the *Il Sagrifizio* of Agostino Beccari, which was played at the court of Ferrara in 1554, that is always quoted as the beginning of sentimental pastoral in European literature. Torquato Tasso followed Beccari after an interval of 20 years, and by the success of his *Aminta,* which was performed before the court of Ferrara in 1573, secured the popularity of dramatic pastoral. Guarini produced in 1590 his famous *Pastor Fido,* and Ongaro his fishermen's pastoral of *Alceo* in 1591. During the last quarter of the 16th century pastoral drama was really a power in Italy. Some of the best poetry of the age was written in this form, to be acted privately on the stages of the little court theatres, that were everywhere springing up. In a short time music was introduced, and rapidly predominated, until the little forms of tragedy, and pastoral altogether, were merged in opera.

Pastoral *romance* dates from the publication, in 1504, of the famous *Arcadia* of J. Sannazaro, a work which passed through 60 editions before the close of the 16th century, and left its mark upon every literature in Europe. This remarkable romance, the type of so many succeeding pastorals, is written in musical prose, into which are inserted passages of verse. The characters live an innocent voluptuous existence, with no hell or heaven in the

background: the narrative, the adventures, the dialogue are equally exalted and unreal.

In Spain the influence of the *Arcadia* made itself rapidly felt through Jorge de Montemayor, whose *Diana* (1524) was founded on Sannazaro. Gaspar Gil Polo, after the death of Montemayor in 1561, completed his romance, and published in 1564 a *Diana enamorada.* Both these works are mentioned with respect, in their kind, by Cervantes. The author of *Don Quixote* himself published an admirable pastoral romance, *Galatea,* in 1584. Lope de Vega made a pastoral of the Nativity introducing much of the Old Testament in narrative episodes related by the characters.

The typical French pastoral, the *Astrée* of Honoré d'Urfé (1610), has almost more connection with the knightly romances which Cervantes laughed at than with the pastorals which he praised. The famous *Astrée* was the result of the study of Tasso's *Aminta* on the one hand and Montemayor's *Diana* on the other, with a strong flavouring of the romantic spirit of the *Amadis.* To remedy the pagan tendency of the *Astrée* a priest, Camus de Pontcarré, wrote a series of Christian pastorals. Racan produced in 1625 a pastoral drama, *Les Bergeries,* founded on the *Astrée* of D'Urfé.

In England the chief example of the form is Sir Philip Sidney's *Arcadia* (written in 1580), published in 1590). In 1584 were published two pastoral dramas, the *Gallathea* of Lyly and the *Arraignment of Paris* of Peele. Greene became more and more imbued with the Italian spirit of pastoral. His *Menaphon* and his *Never too Late* are pure bucolic romances. In *Rosalynde* (1590) Lodge made an interesting contribution to English literature in general, and to Arcadian poetry in particular. This beautiful and fantastic book is modelled more exactly upon the masterpiece of Sannazaro than any other in our language. In 1598 Bartholomew Young published an English version of the *Diana* of Montemayor.

In Spain, France and England there was a strong native tradition of bucolic verse which blended easily, though in differing proportions, with classical impulses from Theocritus, Virgil and the Italians. The Spanish poet Garcilaso de la Vega (d. 1536) is Virgilian, the lyrics of Gil Vicente are of the soil, like the songs of Shakespeare. In the *Bergerie* of Rémy Belleau the new art of Sannazaro joins hand with the simplicity of the Old French *pastourelle.* It was probably the study of the eclogues of Clément Marot that led Spenser to the composition of what is the finest example of pastoral in the English language, the *Shepherd's Calendar,* printed in 1579. This famous work is divided into 12 months, and it is remarkable because in it Spenser turns from the artificial Latin style of pastoral and brings upon the pastoral stage actual rustics using their own peasant dialect, a departure from precedent for which Sidney blamed him.

After Spenser, Drayton is the first pastoral poet who deserves mention. His *Idea: The Shepherd's Garland* bears the date 1593, but was probably written rather earlier. In 1595 he produced *Endimion and Phoebe,* and then turned his fluent pen to the other branches of poetic literature; but after more than 30 years, at the very close of his life, he turned to this early love, and published in 1627 two pastorals, *The Quest of Cynthia* and *The Shepherd's Sirena.* The general character of all these pieces, as of the *Queen's Arcadia* of Daniel, is rich, but vague and unimpassioned. Marlowe's pastoral lyric "Come live with Me," although not printed until 1599, has been attributed to 1589. Barnfield's singular production *The Affectionate Shepherd* was printed in 1594.

With the close of the 16th century pastoral literature was not extinguished in England as suddenly or as completely as it was in Italy and Spain. Throughout the romantic Jacobean age the English love of country life asserted itself under the guise of pastoral sentiment, and the influence of Tasso and Guarini was felt in England just when it had ceased to be active in Italy. In 1606 Day dramatized part of Sidney's *Arcadia* in his *Isle of Gulls,* and about 1625 Thomas Goffe composed his *Careless Shepherdess,* which Ben Jonson designed to imitate in the opening of his *Sad Shepherd.* In 1610 Fletcher produced his *Faithful Shepherdess* in emulation of the *Aminta* of Tasso. This is the principal pastoral play in the language, and in the *Sad Shepherd,* which was perhaps written about 1635, and in his pastoral masques, we see Ben Jonson following along the track that Fletcher had pointed out. The last pastoral drama in the 17th century was Settle's *Pastor Fido* (1677).

Still more characteristic are the lyrical eclogues, usually in short measure, a class of poetry peculiar to the nation and to that age. The lighter staves of *The Shepherd's Calendar* were the model from which all these graceful productions were drawn. Nicholas Breton came first with his *Passionate Shepherd* in 1604. Wither followed with *The Shepherd's Hunting* in 1615, and Braithwaite, an inferior writer, published *The Poet's Willow* in 1613 and *Shepherd's Tales* in 1621. Wither's friend William Browne published in 1613–16 his beautiful collection of Devonshire idylls called *Britannia's Pastorals.* These were in heroic verse and less distinctly Spenserian in character than those eclogues recently mentioned. In 1614 Browne, Wither, Christopher Brook and Davies of Hereford united in the composition of a little volume of pastorals entitled *The Shepherd's Pipe.* The masterpieces of this native school are *L'Allegro* and *Il Penseroso,* as *Lycidas* is the masterpiece of the Virgilian manner.

This sub-Spenserian poetry led in another generation to a rich growth of lyrics which may be roughly called pastoral, but are not strictly bucolic. Carew, Lovelace, Suckling, Stanley and Cartwright are lyrists who all contributed to this harvest of country song, but by far the most copious and the most characteristic of the pastoral lyrists is Herrick. He has, perhaps, no rival in modern literature in this particular direction. His originality and observation, his interest in recording homely facts of country life, combine with his extraordinary gift of song to place him in the very first rank among pastoral writers; in Herrick's hands the pastoral becomes real and modern. From him we date the recognition in poetry of the humble beauty that lies about our doors.

Pastoral came into fashion again early in the 18th century. The quarrel between Philips and Pope gives 1708 a considerable importance in the annals of bucolic writing. Pope had written his idylls first, and it was a source of infinite annoyance to him that Philips contrived to precede him in publication. He succeeded in throwing ridicule on Philips, however, and his own pastorals were greatly admired. Yet there was some nature in Philips, and, though Pope is more elegant, he is not one whit more bucolic. A far better writer of pastoral than either is Gay, whose *Shepherd's Week* was a serious attempt to break with the Arcadian tradition and to copy Theocritus in his simplicity. Swift proposed to Gay that he should write a Newgate pastoral in which the swains and nymphs should talk and warble in slang. This Gay never did attempt; but a northern admirer of his and Pope's achieved a veritable and lasting success in Lowland Scotch, a dialect then considered no less beneath the dignity of verse. Allan Ramsay's *Gentle Shepherd* (1725) was the last, and remains the most vertebrate and interesting, bucolic drama produced in Great Britain. It remained a favourite, 150 years after, among Lowland reapers and milkmaids. With the *Gentle Shepherd* and Johnson's denunciation of the whole pastoral convention (including *Lycidas*) the chronicle of pastoral in England practically closes.

The taste of the 18th century was very agreeably tickled by the religious idylls of Salomon Gessner, who died in 1787. His *Daphnis und Phillis* and *Der Tod Abels* were read and imitated throughout Europe. Jean Pierre Clovis de Florian, who began by imitating the *Galatea* of Cervantes, continued with an original bucolic romance entitled *Estelle.* But pastoral is a form of literature which disappears before a breath of ridicule. Neither Gessner nor his follower Abbt were able to survive the laughter of Herder. Since Florian and Gessner there has been no reappearance of bucolic literature properly so-called. Throughout Europe the Romantic interest in nature and the humanitarian interest in the poor combined in the 19th century to produce a new form, the rustic stories of Auerbach, of George Sand and of Hardy, which are the modern equivalent of the pastoral, stripped of Arcadian convention and merging in the larger *genera* of realist or romantic fiction.

PASTORAL EPISTLES, THE. This is a title given to three New Testament epistles which purport to have been written

by St. Paul to Timothy (two) and Titus. From the second century onwards it was recognised that these three epistles bore specially upon church work and orders; but it was not until the eighteenth century that some German scholars devised the convenient term "Pastoral" to denote the group. "How people ought to bear themselves in the household of God" (I. Tim. iii.15) is the general subject of all three, and special stress is laid upon the responsibilities of Christian ministers in their pastoral care of the Church. The epistles contain much personal information, especially 2 Timothy, but their common aim differentiates them from a semi-private letter like Philemon. In outlook, diction and style, they stand by themselves in the New Testament canon.

1. First Timothy is a pastoral letter in the form of counsels from St. Paul to his younger colleague Timothy (i.1–2), but the plural "you" in the final greeting (vi.21) reveals the fact that all along the writer has the Church in his mind. After reminding Timothy that he had been left at Ephesus to safeguard the faith of local Christians, the writer proceeds to contrast the antinomian practices of the errorists with the Pauline gospel as the norm of faith and morals (i.3f). To this apostolic trust and tradition Timothy is bidden adhere. Then follow a series of regulations on various aspects of church-life (ii.1f); for whom and by whom prayer is to be offered in worship, the latter counsel (8f) drifting into a word on the subordination of women; the qualifications of a bishop (iii.1f), of deacons and deaconesses (9f); the general advice at the close of this section (14f) implies that even organisation and worship cannot altogether eliminate heresies and moral aberrations, so that the writer passes (iv.1f) to the need for Timothy meeting such dangers by a faithful ministry. This includes wise behaviour towards individual groups in the church (v.1f), such as widows (3–16), presbyters (17f) and slaves (vi.1f). A brief conclusion (vi.3f) contrasts the true "man of God" with the errorists who profaned religion by their quarrelsomeness and self-seeking.

Second Timothy is less loosely knit and less discursive. After (i.1f) warning Timothy against false shame, when his chief was imprisoned and suffering, he urges the younger man (13f) to follow the heroic example of a certain Onesiphorus, who had proved himself loyal to Paul and the Pauline cause, and to uphold at all costs (ii.1f) the gospel of his chief, transmitting the apostolic tradition to subordinate agents, teaching and practising it himself, and maintaining a firm position against (16f) controversial errorists of the period. After exposing their methods and spirit (iii.1f), the writer warns Timothy again (iii.10f) by his own example that suffering is inevitable in the service of the gospel, and that the apostolic gospel must be upheld (13f) unflinchingly (iv.1f). The final paragraphs (iv.6f) solemnly describe the critical position of the apostle as he faces a martyr's death, and the epistle closes with a number of personal messages.

Titus is on the whole more of a unity than either of the others. After the greeting (i.1–4), the writer recalls the duties of Titus in the island of Crete, where presbyters have to be appointed with care, and the local errorists dealt with sharply. Then come instructions on the sound doctrine which Titus is to convey to various classes of people (ii.1f), in the light of the true gospel (10f); these general counsels are reiterated (iii.1f) in view of the outside world, believers being expected to rise above worldliness and wrangling. A few personal remarks (iii.12f) conclude the epistle.

The only passage in Titus which seems out of place is i.7–9, which reads like a later interpolation, breaking the connection between ver.6 and ver.10; it may be a marginal gloss added by the writer himself, or inserted by some editor who was interested in the monarchical episcopate. Such additions were not uncommon in writings used for ecclesiastical procedure. "It is very probable that the Pastoral Epistles contain many interpolations in which statements about errors and even directions about discipline have been somewhat altered to suit the requirements of the middle of the second century" (Lindsay, *Church and Ministry in the Early Centuries*, p. 141). Thus it is possible that the formula "Faithful is the saying" (I. Tim. i.15, etc.) is an appended phrase. I. Tim. v.23 also reads like a marginal gloss, unless it originally lay elsewhere. That some passages have been displaced is a fair hypothesis; *e.g.* I. Tim. i.12–17 would come better between ver.2 and ver.3, whilst vi.17–21 is either a later edition or misplaced from the vicinity of ver.8, and the correct place for v.16 is after v.4. In 2 Tim. iv.9f the heterogeneous character of the text is most apparent; there is no good reason to doubt the authenticity of the contents, but it is hardly possible to take them as they stand, and the general conclusion is that we have here two or three notes written at various times, which have been put side by side by the editor, and which refer to some earlier phases in the apostle's life.

2. This raises the problem of the literary origin of the epistles. Were they written by the apostle Paul himself, or in his name by some disciple who sought to convey what he believed to be his master's mind on a religious situation of later date? The Pastorals were suspected in some quarters of the early Church; they were rejected, for example, by Marcion as being private letters, as well as by Basilides and others, including Tatian, who retained only Titus. But such rejections were probably due to dislike of their teaching and cannot be held to reflect any reasoned belief in their post-Pauline origin. The reasons which have led an increasing number of scholars to place them after the life-time of St. Paul are drawn from internal evidence of style and subject, style including diction. There are, however, differences between the vocabulary of the earlier and later Pauline letters which must be taken into account in handling the Pastorals. They remind us of no writer so much as St. Paul. Yet neither differences of subject-matter nor a fresh emphasis on certain topics, much less any supposed change of amanuensis, avail to weaken the inferences drawn from the language of the Pastorals, which is distinctive, and not distinctive of the Paul we otherwise know. An examination of the Greek vocabulary shows not only a remarkable proportion of words used for the first time by the writer, but new compounds, an absence of characteristically Pauline terms, the substitution of one word for another used in the same or a similar sense by the apostle, and an independent use of the Greek particles, which is of much significance. The philologist Th. Naegeli, in a monograph on the language of the apostle (*Der Wortschatz der Apostels Paulus*, 1905, pp. 85f), deduces from such phenomena that the Pastorals cannot have been written by him—a conclusion which is all the more significant that he does not come to this conclusion about any other Pauline letter.

The theological outlook is by itself also. It is not easy to suppose that in three epistles the apostle, for example, would ignore such fundamental truths of his gospel as the fatherhood of God, the union of the believing man with Jesus Christ, and the power of the Holy Spirit in the Christian experience. The only explanation of this seems to be that the epistles were written by a disciple of St. Paul who, in the name of his master, and on the basis of some authentic fragments of Pauline correspondence, wrote against tendencies which threatened the later church, denouncing incipient forms of gnosticism, for example, roundly and indiscriminately. The writer fully believed he was giving what was his master's mind, as an historian would compose a speech in the name of a hero—perhaps as his contemporary Luke composed some of the Pauline speeches in Acts. He felt rightly that Paul would have been anti-gnostic, and that the maintenance of the apostolic gospel was essential for the Churches. His spirit was that of the apostle himself in the prediction of Acts xx.28f. It is no longer tenable to identify the errorists with any school of second century gnostics, but it is equally impossible to find them in any party which Paul is known to have encountered in his lifetime. Also, the spirit in which they are attacked is not in line with St. Paul's method. His way of enforcing ethical requirements and of insisting on organisation is different from that followed by the author of the Pastorals—a shrewd man, who writes with excellent sagacity and point, but hardly with the sustained insight and creative vigour of his master. We might say that this author possesses the intuition of authority rather than the authority of intuition.

The alternatives are (i.) to regard the epistles as genuine on the whole, containing extracts from Paul's correspondence, but largely expanded and edited, or (ii.) to read them as Pauline *in toto*. The

latter hypothesis has to meet the difficulty of placing them in his life-time; either they must be viewed as written after his supposed release from the first imprisonment at Rome, or they must be somehow relegated to his career as outlined in Acts. The latter view is extremely hard to present satisfactorily, for although there are gaps in his life as it is recorded, it is almost incredible that he should have suddenly written in this strain and then dropped into the strain familiar to us in the other epistles Furthermore, the historical setting is hard to reconstruct. That Titus went to Crete, and that Timothy had a responsible position at Ephesus, is indeed likely, for apart from such tradition the setting of the Pastorals would be incredible; even a pseudonymous author would not be likely to invent freely such a framework. But to find any place for such activities during the lifetime of the apostle is not easy! Indeed the majority of those who defend the traditional hypothesis relapse on the view that the Pastorals represent a period in the apostle's life subsequent to the career described in the Acts of the Apostles It is a moot point whether the apostle was ever released from his imprisonment, however, and even if he was, the problem of fitting the Pastorals into this closing period of his career involves considerable historical ingenuity.

To sum up—the data of the Pastorals are so conflicting and ambiguous that they seem to justify us in supposing that "a writer, believing himself to be in accord with St Paul's teaching, and possessing some remains of his correspondence, expanded such into these letters, in order to combat erroneous speculations in the Church by opposing to them sound teaching and an objective standard of belief. He probably lived at a time when ecclesiastical organisation was growing in importance, and seems to offer a safeguard against the spread of moral and intellectual error. Timothy and Titus are thus representative figures, standing for those whom the writer really wished to admonish and instruct" (G. W. Wade, *New Testament History*, 1922, p 303) It does not follow, however, that he wrote the epistles in their canonical order. The likelihood is that 2 Timothy was the earliest, 1 Timothy betrays a more advanced situation, and by the time he had come to write it the author had used up nearly all his Pauline fragments, in 1 Timothy he is more of an author than an editor. As the epistles had no titles, it was natural that when they were incorporated in the canon, 2 Timothy, with its richer and more detailed outlook on the last days of the apostle, should be placed second.

Bibliography.—The most adequate editions in English are by Ellicott (4th edition, 1864), J H Bernard (*Cambridge Greek Testament*, 1899), N. J. D. White (*Expositor's Greek Testament*, 1910), R S J Parry (Cambridge, 1920), and W Lock (*International Critical Commentary*, 1924), though the expositions by A. E Hillard (1919) and A. Plummer (*Expositor's Bible*, 1888) are also valuable for insight into the religious spirit of the epistles, as is the commentary by E F Brown (*Westminster Commentaries*, 1917) on the English text All these represent the conservative position upon the authorship. In German scholarship this position is best represented by B Weiss (Meyer's *Commentar*, 7th edition, 1902) and Wohlenberg (Zahn's *Commentar*, third edition, 1923), otherwise the German editions of importance reflect the non-Pauline authorship, *e g.*, Holtzmann's *Pastoralbriefe* (1880), von Soden's (*Handcommentar*, 1891), and M Dibelius' (in Lietzmann's *Handbuch*, 1913), which are the outstanding editions

Schleiermacher's tract *Ueber den sogenannten ersten Brief des Paulus an d. Tim.* (1807) really started the critical movement, which Holtzmann stated fully; later upholders are Renan (*S. Paul* pp xxiif, *L'Eglise Chrétienne* ch. v), Weizsaecker (*Apostolic Age*, ii pp 163f, 259f), McGiffert (*Apostolic Age*, pp 398f, 423f), and P N Harrison (*The Problem of the Pastoral Epistles*, Oxford, 1921), which may be said to have settled the linguistic case against the Pauline authorship. The opposite side is put by writers like Bertrand (*L'Authenticité des épîtres Pastorales*, 1888), W E Bowen (*Dates of the Pastoral Epistles*, 1900), J. D. James (*Genuineness and Authorship of the Pastoral Epistles*, 1906), and Zahn in his *Einleitung in das Neue Testament* (sections 33f). R. A. Falconer's article in the *Dictionary of the Apostolic Church* (ii. pp. 583f) sums up the traditional position adequately, as opposed to the present writer's conclusions in the *Encyclopaedia Biblica* (5079f).

Special monographs on points of importance are C. W Otto's *Geschichtliche Verhaeltnisse der Pastoralbriefe* (1860), W Mangold's *Irr lehrer der Pastoralbriefe* (Marburg, 1856), W. Lutgert's *Irrlehrer d. Pastoralbriefe* (1909), and H. H. Mayer's *Ueber die Pastoralbriefe* (Gottingen, 1913), the last-named emphasizing the later church-orders implied in the epistles, a point already treated by J. Reville in his *Origines de l'épiscopat* (i. pp. 262f).

On First Timothy, since Melanchthon's special commentary (*Enarratio*, 1561), there have been a series of works, including Koelling's (1882, f) and Liddon's *Analysis* (1897); on Second Timothy, Bahnsen's *Sogenannte Pastoralbriefe* (1876), and on Titus monographs from Mosheim's *Erklarung* (1779) to Kuinoel's *Explicatio* (1812); but the epistles have been commonly edited together. (J Mof)

PASTORAL STAFF, in the Christian Church, an ensign of office or dignity It is some five feet long, ending at the top in a crook (*volute*) bent inwards, and made of metal, ivory or wood If of metal, it is hollow; if of wood, it is usually covered with metal The crook is usually richly ornamented, and is divided from the shaft by a boss; the shaft is commonly separated into sections by rings, so that it can be taken to pieces.

The pastoral staff is the ensign proper of cardinals (except cardinal-deacons) and bishops; but the former are entitled to use it only in the churches from which they derive their titles, the latter only in their dioceses. The pope so early as the time of Innocent III did not carry the pastoral staff, and it would seem never to have been his custom The *ferula* that the Ordo of Cencius Sabellius (ch 48) speaks of was not a pastoral staff, but the symbol of authority over the papal palace, with which by its transference he was invested Abbots carry the pastoral staff only when specially empowered by the pope to do so, and then only in the territory under the jurisdiction of their monastery and in the churches subordinated to it With certain restrictions the pastoral staff is also sometimes conceded to dignitaries of cathedral and collegiate churches.

PASTRY, HOME MADE. General rules for the making of pastry are: wash hands in cold water. Work in a cool place Use dry sifted flour Mix with very cold water Roll away from you and the same way, then, if necessary, across Roll firmly but lightly Lift paste to see that it does not stick to board Flour hands, board and roller but not the paste Add liquid by degrees: it is impossible to say exactly what amount will be required as the mixture-absorbing quality of flour varies Mix with knife or fork Use hands as little as possible Pieces scraped from board, roller and hands should not be used. Trimmings may be rolled out again but after several rollings will not be as light as the original pastry.

Plain Short Crust.—For tarts, tartlets, pastries: 1 lb. flour, 6 oz clarified dripping, margarine or half lard and half butter, 1 teaspoonful baking powder, ½ teaspoonful salt, cold water Sieve dry ingredients Rub in fat with floured finger-tips until flour resembles bread crumbs Mix to a stiff dough Roll Bake in a moderately hot oven For a rather richer paste use 8 oz fat and mix with milk and water.

Rich Short Crust.—1 lb flour, 12 oz butter or margarine, 1 teaspoonful baking powder, 1 or 2 eggs, 2 teaspoonfuls castor sugar, a pinch of salt Sift dry ingredients Rub in butter as in plain short crust Mix yolks of eggs and water Mix to smooth stiff paste Roll Bake in a moderately hot oven If used for a tart, five minutes before serving brush over with egg white and sprinkle with sugar For savoury short crust proceed as before, but omit sugar and white of egg

Flaky Pastry.—For sweets or for meat pies and sausage rolls ½ lb flour, pinch of salt, 6 oz margarine and lard mixed, cold water Divide lard and margarine into three portions Sieve dry ingredients Rub in one-third fat Mix to fairly stiff paste Roll into long thin strip Place one-third of fat all over this in little lumps, dredge with flour and fold in three Press edges carefully together and turn fold to left hand Roll out again, put on the remainder of the fat as before, flour and fold After three folds and three rolls, roll into required shape Bake in quick oven.

Puff Paste.—For vol-au-vents, patties, pies, tarts ¾ lb flour, ¾ lb butter or margarine, yolk of 1 egg, 1 dessertspoonful lemon juice, pinch of salt, cold water Sieve flour and salt, rub in 1 oz of fat Put flour on board in a heap Make a hollow in centre

Mix egg yolk and liquids. Mix into flour with a fork, then with fingers to a firm paste. Knead with floured hand until paste leaves board clean: dust with flour as necessary until you have a smooth firm paste. Fold over into the middle. Roll into a square. Hold up so that its own weight helps to pull paste into right shape. Divide fat into four parts. Cut one part into small pieces. Place on paste at regular intervals. Fold the four corners over until they meet in centre. Turn folded side down. Roll twice to form a square. Repeat with fat portions two and three. Wrap paste in cloth, leave in cold place 15 minutes. Add fourth portion of fat as before. Roll and fold into three. The paste should now be firm and spongy. Roll as required for use. This pastry may be made on previous day except for the fourth portion of fat and put away in cloth in a cold place. Bake in a hot oven. Reduce heat gradually.

Suet Pastry.—For boiled or steamed meat or fruit puddings and dumplings: ½ lb. flour, ½ teaspoonful baking powder, pinch of salt, 4 oz. suet. Sieve dry ingredients. Remove skin and strings from suet. Chop very finely on a floured board. Add to flour. Make a well in centre. Stir in flour with a knife from sides of basin. Make a smooth soft dough which leaves the sides of basin clean. Knead lightly until free from cracks. Place on floured board. Roll as required.

Cheese Pastry.—For cheese straws and biscuits: 2 oz. butter, 2½ oz. flour, 2 oz. Parmesan cheese, 1 oz. Cheshire or Cheddar cheese, yolk of 1 egg, salt and cayenne pepper. Mix flour and grated cheese together. Rub in butter, season with salt and cayenne pepper. Form into stiff paste with egg yolk and water, adding liquid gradually. Roll as required. Bake in moderate oven.

(D. C. Pe.)

PASTURE: *see* Grass and Grasslands.

PASURUAN, a residency of Java, Dutch East Indies, area, 8,782 sq. kilometres. It is in the south-east of the island, and is bounded on the west by Surabaya and Kediri, on the east by Besuki, north by the Java sea and south by the Indian ocean. It is extremely mountainous, the whole of its central portion being occupied by the Tengger plateau and its mountains with heights of over 12,000 ft., and the Welirang-Arjuna mountain group (heights over 10,000 ft.), with the valley of the Brantas river between them, and part of the Ijen highlands, whilst most of the southern coastal land is hilly, the level portion being in the east. The northern coastal lands however, form a wide plain with rich volcanic soil, of great fertility, and, with the Malang plain, one admirably suited to the growth of sugar-cane, of which culture Pasuruan is one of the leading centres in Java. Tobacco is another product, also coffee, cassava, coca and maize, whilst rice, coco-nut palms, and the usual other native crops flourish. In the forest of Pasuruan are wild cattle (*banteng*), which are used to improve the breed of the humped Java cattle, also for food and agricultural purposes, and the hides are made into leather. The population is 2,231,832, almost entirely Javanese, and including 11,886 Europeans and Eurasians. Pasuruan, on the north coast, is the capital, and seat of the resident: it has a sugar production experimental station, and with Probolinggo (26,040) further along the coast, is a port of call for Royal Packet Navigation Company vessels. Other towns are the mountain health resorts of Tosari and Nongkajajar, Malang, on the Brantas, a military settlement, Lawang, which has an assistant-resident, Bangil, a railway junction, and Pasirian, near the south coast. The railway from Surabaya to Banyuwangi passes through Pasuruan, first along the coast, and then inland, between the Ijen and Tengger plateaux, with a branch to Pasirian, and another to Kediri.

PATAGONIA, a regional name applied to the southern part of South America south of approximately 40° S. lat. Physiographically, it is divided into two longitudinal sections—the cordilleras of the Andes (including the islands of the Chilean archipelago) and the Patagonian table-land between the Andes and the Atlantic ocean. It is as a regional name for this table-land region that the term Patagonia is now most commonly used. The term, in this sense, is usually applied to that section of the Argentine Republic between the Negro river and its tributary the Limay, on the north, and the Beagle channel, on the south, together with that section of southern Chile in the region of the Strait of Magellan which lies east of the Andes. Actually the Patagonian table-land extends considerably north of the Negro river and, in addition to the Argentine territories of Tierra del Fuego, Santa Cruz, Chubut and Rio Negro, includes the southern part of the territories of Neuquen and La Pampa. There is no sharp line of division, but the chief characteristics of the table-land (a surface cover of rounded pebbles or shingle, and volcanic materials in place of the clays of the pampa) appear a short distance north of the Colorado river.

General Description.—The general aspect of the table-land is that of vast steppe-like plains rising terrace-fashion from high coastal cliffs to the foot of the Andes; but their true aspect is by no means so simple as such a general description would imply. Along the Negro river they rise by a series of fairly level plains from 300 ft. at the coast to about 1,300 ft. at the junction of the Limay and Neuquen rivers and 3,000 ft. at the base of the Andes. South of the Negro river they are much more irregular. There volcanic eruptions have occurred down to fairly recent times. Basaltic sheets, apparently only recently cooled, cover the table-land east of Lake Buenos Aires and Lake Pueyrredon. On the Chico and Santa Cruz rivers they have spread to within about 50 m. of the coast and reach almost to the coast south of the Coyle and Gallegos rivers. Basaltic massifs like Añecon Grande east of Lake Nahuel Huapi and those along the railway south of Maquinchao, in the Somuncurra region west of the Gulf of San Antonio, and south of Lake Musters, are the salient features of the landscape. The coast consists in large part of high cliffs separated from the sea by a narrow coastal plain.

Deep, wide valleys bordered by high cliffs cut the table-lands from west to east. All are the beds of former rivers which flowed from the Andes to the Atlantic, but only a few now carry permanent streams of Andean origin (the Colorado, Negro, Chubut, Senguerr, Chico, Santa Cruz). The majority either have intermittent streams like the Chalia, Coyle and Gallegos, which have their sources east of the Andes, or, like the Deseado, are completely dry except for salt ponds in the deeper depressions and so altered by the combined effect of wind and sand as to afford little surface evidence of the rivers that once flowed in them. In the past many observers have classed with these true river valleys the numerous other long depressions without outlet, known as *bajos,* that are scattered over the table-land, but more recent observers have found no evidence that they were once river channels. A part of them at least are considered as caused by local faulting. Wind erosion has undoubtedly contributed to their present form and it is due to the aridity of the region that they have not been filled in by the normal processes of erosion. They serve an important purpose in the collection of the scanty surface water. Alluvial soils of considerable depth have been built up in them. In the larger of them ranches are located. Along the main routes they are of great value as pasturing grounds for droves of cattle and sheep on their way to seaport or railhead. The shingle (rounded pebbles of granite and eruptive rock), although of glacial origin, is the product of the destruction of old moraines carried out over the table-land before the transverse valleys were cut and the circulation of water from the glaciers localized in them. Its concentration on the surface is due to the action of the wind in sorting the pebbles from the finer and more easily moved materials.

The line of contact between the Patagonian table-land and the folds of the Andes is marked by a line of lakes. From Lake Aluminé northward these lakes are not of glacial origin but have been dammed up by lava flows. South of Lake Aluminé they are long lakes of Alpine form that reach back fiord-like into the cordillera. Their beds have been deepened by glacial action and in most cases are continued across the table-land by the broad transverse valleys described above, through which all the lakes at some former time drained to the Atlantic. From Lake Nahuel Huapi northward the lakes, except for Lake Lacar, still drain to the Atlantic. South of Lake Nahuel Huapi all of the lakes except Viedma and Argentino now drain to the Pacific through deep canyons cut across the cordillera; and the interoceanic divide

follows the terminal moraines of the old glaciers to the east of the present lake beds, leaving the majority of the transverse valleys without streams. Lakes Viedma and Argentino, which drain to the Atlantic by the Santa Cruz river, lie opposite that part of the cordillera which is still effectively covered by inland ice. The lakes from Nahuel Huapi southward are frequently described as lying wholly or in part in a longitudinal depression that separates the table-land from the cordillera. This depression, however, is by no means continuous, and, in many places, the table-land butts directly against the cordillera.

In the Argentine Territory of Neuquen the Andes lower rapidly toward the south, Cerro Domuyo east of the upper basin of the Neuquen river being the last peak that exceeds 12,000 feet. The cordillera there consists of a broad zone of mountain chains and narrow valleys. The crests that have a fairly uniform elevation have been carved by erosion from the older Andean rocks. Above them rise isolated volcanic peaks. From Lake Buenos Aires southward the Andes are known in detail only on their eastern border. Two great fields of inland ice fill all the central part of the cordillera from about 46° S. lat. to 51° S. lat., separated only at the 48th parallel by the Baker canal where the Baker river, draining Lake Buenos Aires from the north, and the Pascua river, draining Lake San Martin from the south, break through the cordillera. From these ice-fields great glaciers flow down to the lake region on the eastern border of the cordillera and to the fiords of the western border. At the time of writing this article these ice-fields have never been crossed, although the southernmost field has recently been penetrated for some distance by expeditions working in from Lake Argentino and Lake Viedma. On the Chilean side the coast and the fiords that thrust far into the cordillera have been examined and mapped by British, Chilean and other hydrographic surveys and the snouts of numerous glaciers that flow down to the fiord heads have been noted.

Geology.—The deep sedimentary cover of the table-land contains a Triassic Series, an Upper Cretaceous and a Tertiary, through which outcrops in places (particularly along the Atlantic coast in the territory of Rio Negro) the core of ancient granites and porphyries. North of the basaltic massif of Añecon Grande the granites rise to over 5,000 feet. On the lower Negro river, Tertiary tufas and grey sandstones form the cliffs that border the river valley, while at the foot of the Andes the table-land is of variegated marls and red sandstones of Cretaceous age Here and there throughout the whole table-land are evidences of an extensive peneplain which dates from the end of the Pliocene. This peneplain has not been base-levelled uniformly throughout but is warped and broken by local faulting. The basalt flows and intrusions that are the characteristic features of so many sections of the table-land have been mentioned.

The central part of the Andes of Patagonia consists of a granite core which thrusts through the folded sedimentary cover to form the crests of the cordilleras. Recent volcanic rocks (andesites and basalts) cover the sedimentaries and the granitic core over large areas throughout this section of the Andes and have spread far out over the eastern table-land. In the north the andesites are of Miocene age and covered by Pliocene basalts. Farther south the andesite intrusions continued well into and probably through the Pliocene. The folded sedimentaries do not reach across to the western slopes of the Andes north of 52° S. lat. Fiords and valleys, longitudinal and transverse, some of which cut across the cordillera and drain the lakes of the eastern side to the Pacific, divide the Patagonian Andes into blocks that have their lowest average altitude (about 6,500 ft.) in the north and in Tierra del Fuego and rise to 13,000 ft. between 46° and 50° S. lat. A line of active volcanoes stands along the Chilean shore in the north completely separated from the main ranges of the cordillera, and isolated cones, all of which are of contemporary origin, while some are of recent eruption, form the outstanding peaks throughout the Patagonian Andes. (For geological history of Patagonia *see* SOUTH AMERICA.)

Climate.—There is abundant rainfall on the west coast and the Chilean archipelago. In the Andes the precipitation, a large part of which is snow, is very heavy. The annual mean increases from 80 to 200 in. on the islands and the coast of the mainland to over 200 in. on the upper western slopes of the high cordilleras. In the cordilleras, as on the west coast, the greater part of the rain or snow falls in winter and this seasonal distribution prevails throughout the Argentine table-land north of the Santa Cruz river. Only along a narrow strip at the foot of the Andes is there plentiful rainfall on the table-land. East of this sub-Andine zone the table-land is semi-arid with the rainfall diminishing rapidly from west to east. South of the Santa Cruz river the rainfall increases somewhat and the rainy season changes from winter to early summer, December being the rainiest month at Puerto Gallegos. Winds from the Atlantic ocean bring some rain to the coast, but they rarely penetrate far inland on account of the great prevalence of westerly winds throughout the whole of Patagonia. On the table-land these west winds are particularly violent and diminish only slightly in winter. On the west coast the mean summer temperatures are low—58° F at Puerto Montt (41° 28′ S. lat.) in the month of January, and 38° F on the Evangelistas islands (52° 24′ S. lat.). The winters are mild, the mean temperature for July being 45° F at Puerto Montt and 38° F on the Evangelistas. Winters are fairly cold in the sub-Andine zone; the mean temperature for July at the valley of 16 de Octubre (43·9 S. lat., 71° 25′ W. long.), the most southerly station in the zone for which there are weather records, is 35·7° F. The summers are moderately warm, the mean temperature for January at 16 de Octubre being 57° F; but no month of the year is free from frosts. On the coast the mean temperature for January at San Antonio is 72·6° F, at Comodoro Rivadavia 66·5° F, at Santa Cruz 60·6° F. For July the mean temperatures at these points are 43·5° F, 44·6° F and 33° F, respectively. (For fauna and flora *see* ARGENTINA.)

Population.—The original inhabitants of Patagonia are now nearly extinct. Occasional families or groups of Alakalufs and Yahgans are still to be found on the islands of the Chilean archipelago. (*See* TIERRA DEL FUEGO.) On the Patagonia table-land one may still find small encampments of Tehuelches and other aboriginal tribes and there is still a small colony of mixed Tehuelches and Araucanians in the Senguerr valley south of San Martin, but pure bloods are very scarce. The Tehuelches, remarkable for their great stature (they average 6 ft. to 6 ft. 4 in.) were the dominant race. Other tribes were the Pehuenches, Ranqueles, Pampas and Araucanians.

Except on Chiloé island the precipitous coasts of the islands and the dense forests that come down to the water's edge on the mainland have prevented white settlement west of the Andes other than the temporary camps of wood-cutters at the most accessible points. Since the founding of Punta Arenas (now Magallanes) in 1843 settlement in that section has developed rapidly. The town itself has grown to a population of 20,000 and is the commercial centre, not only of that section of Chile but of the southern part of the Argentine Territory of Santa Cruz as well. Cattle-raising was the original industry in the Punta Arenas region, but sheep were introduced in 1879 and since 1885 sheep-raising, which is better adapted than cattle-raising to the climate here as in most parts of Patagonia, has spread rapidly until sheep ranches cover all of the northern part of Tierra del Fuego and the mainland not only as far as the international boundary but beyond into the southern part of Santa Cruz whose settlement was effected by colonists working northward from the Punta Arenas region. Considerable gold has been mined in this section of Chile, but operations have now practically ceased. Coal is mined near Magallanes and the sawing of lumber, chiefly for the Argentine trade, from logs brought from as far north as the Peninsula of Taitao is an important and growing industry.

Settlement.—Spanish settlements were started at several points on the Atlantic coast toward the end of the 18th century. Carmen de Patagones near the mouth of the Negro river was the only one of these early settlements that was at all permanent and the fact that this settlement did not disappear like the others was due to the collection and exportation of salt from salt ponds in the vicinity. Cattle raising was beginning there also when the revolution against Spain broke out. The herds were scattered dur-

ing the revolution but re-establishment began shortly after its close. The Indians, however, were for the most part hostile and, until after the 1879–1883 campaign which decisively ended their power, not only prevented any colonization beyond the coast but checked practically all exploration of the interior.

After the close of the Indian campaign, exploration and settlement proceeded rapidly. Settlement south of the Negro river came from two directions. Colonists from the north followed the coast southward, establishing settlements first at river mouths and then pushing gradually back into the interior. Meanwhile the sheep ranches were pushing northward from the nucleus at Magallanes (Punta Arenas) and by 1896 had reached the Santa Cruz river. In the north along the eastern border of the Andes, at Lake Nahuel Huapi, in the upper valleys of the Limay and Neuquen rivers, and northward far beyond the limits of Patagonia, Chilean colonists (mainly of mixed white and Araucanian blood, but with some Germans from the Llanquihue colonies) began to settle at an early date. The migration from Chile probably originated in the practice of the native inhabitants as well as of the European settlers in the Chilean lake region of driving their cattle back and forth through the passes of the Andes following the pasturage seasons. It is believed that Jesuit missionaries had established themselves in the region as early as the latter part of the 16th century. A number of villages, of which San Martin de los Andes and Junín de los Andes in the southern part of the Territory of Neuquen and Chos Malal in the northern part are the most important, have developed in this section in the wider of the lake basins or river valleys. The Zapala ranch at the end of the Southern railway of Buenos Aires is the railhead for all of these mountain villages.

Previous to the campaigns against the Indians the permanent settlers from Chile held their concessions from the Indian chiefs. They increased rapidly until 1890 when the Argentine Government closed the frontier for a five-year period. After the Chile-Argentine boundary dispute had been settled the Chilean Government attempted to get the Chilean settlers back to lands in the Chilean lake region, but there is still a very large Chilean element in the population of the region. The first Argentine colonists in this section, except the Welshmen from Rawson who established themselves in the 16 de Octubre valley as early as 1886, came from Mendoza and San Juan. They were followed after 1890 by settlers of many nationalities and particularly by foreign land companies whose first concessions in Patagonia were located along the Negro and Neuquen rivers. It is in this northern section along the lower slopes of the Andes between the headwaters of the Chubut and Neuquen rivers that the most varied resources of Patagonia are to be found. Wheat, rye and potatoes are grown on irrigated lands on the valley floor, not only for local consumption but to some extent for export. Considerable gold has been placered along the Neuquen river and there has been some exploitation of the timber resources for local needs although many of the forested areas have been destroyed by fire. In the Andean zone of abundant rainfall sheep do not do well and it is there that the cattle-raising industry of Patagonia is concentrated. As one goes eastward into drier regions one finds sheep-raising combined more and more with cattle-raising until on the truly arid table-land cattle give way entirely to sheep. Here and there along the Negro and Chubut rivers the raising of farm crops is practiced under irrigation in limited areas while some favourably located ranches on the table-land have small areas planted with forage crops for the horses that are used on the ranches. Dams constructed on the upper Neuquen now permit the regulation of the flow of water for irrigation purposes to the Cuenca Vidal depression and agricultural villages surrounded by fields of grain, alfalfa and grapes are rapidly developing there.

Land and Water Problem.—Much land in Patagonia has been granted by the Government to Argentina and foreign proprietors but the public lands are still extensive. These public lands are not to be considered as unpopulated. They furnish grazing land for the *pobladores,* sheep raisers who own no land and must shift from place to place as new concessions of public land pass into private ownership. The earlier Government grants were very large, but the Government has now changed its policy and limits its grants to groups of settlers which it is now endeavouring to locate in various sections of the table-land to 625 hectares to each settler. The Government also desires now to break up the earlier concessions into smaller holdings. Holdings of this size are not suited to sheep-raising, since the average capacity on the table-land is from 30 to 50 head per 100 hectares.

Water for the flocks is a matter of much concern. Its complete absence accounts for those few areas which are still unoccupied. The *manantiales,* pools of water concentrated in depressions from rain and snow, are important but most of them do not long survive the rainy season. There are permanent pools in many of the larger depressions but they are mostly saline. Along the dry lower courses of intermittent streams, underground streams are frequently found. Lines of wells follow these underground streams as along the course of the Picun Leufu above the confluence of its bed (now dry for several miles from its mouth) with the Limay river. On both sides of the lower Negro deep wells have been sunk over the Tertiary platform and windmills for pumping water are a feature of every ranch. The red sandstone areas are completely without available water but water issues from the base of the volcanic rock in those sections where the underlying rock is impermeable.

Wool was until quite recently the only export from the sheep ranches but refrigerating plants have now been built at Puerto Deseado, San Julian, Puerto Gallegos and at Rio Grande on Tierra del Fuego. Their combined output in 1927 was 631,249 animals. Of this number 608,911 were exported. On the Chilean side of the boundary there are refrigerating plants on the Strait of Magellan, at Rio Seco and at Puerto Sara, 8 m. and 80 m. respectively, north from Magallanes (Punta Arenas). The driving of the sheep to the refrigerating centres is a difficult task for the distances are great and the problem of feed and water is serious.

Railways.—The Southern railway of Buenos Aires has constructed a 5 ft. 6 in. gauge line for about 860 m. from Bahia Blanca which crosses the Colorado river to the famous Choele-Choele agricultural region of the lower Negro river and then runs up the Negro, serving the numerous agricultural colonies in the irrigated oasis of the river valley; passes through Neuquen, the capital of the Territory of Neuquen at the confluence of the Neuquen and Limay rivers; and extends west for about 150 m. to the Zapala ranch in south-central Neuquen. The Zapala ranch has become the rail centre for the whole of the sub-Andean cattle-raising zone of Neuquen. From San Antonio the Argentine Government has built about 280 m. of a railway which now serves important ranches in the Valcheta and Maquinchao depression and will eventually reach Bariloche on Lake Nahuel Huapi. Viedma, the capital of the Territory of Rio Negro near the mouth of the Negro river has no rail connection, but a line swung south from Bahia Blanca is about two-thirds completed. Rawson, the capital of the Territory of Chubut, near the mouth of the Chubut river, has also no direct rail connection but a short line of meter gauge runs from Puerto Madryn to Trelew (a few miles west of Rawson) and continues for about 35 m. through the Welsh settlements of the lower Chubut. Its terminus is connected by cart roads with the Welsh colony in the 16 de Octubre valley and important holdings of various land companies in the same region. In southern Chubut a short railway of 5 ft. 6 in. gauge connects the Sarmiento colony near Lake Musters with Comodoro Rivadavia. It is proposed to extend this line to Lake Buenos Aires. In northern Santa Cruz a 5 ft. 6 in. gauge railway has been built from Puerto Deseado north-westward over the table-land north of the dry bed of the Deseado river for about 180 miles. Plans for this line call for an extension north-west to Lake Nahuel Huapi through the 16 de Octubre valley. Puerto Gallegos, capital of the Territory of Santa Cruz, a growing settlement that is competing with the Chilean port of Magallanes as a centre for the sheep-raising region of southern Patagonia, has no rail connections.

Administrative Divisions.—Chile in the early days of the republic claimed a large part of the eastern table-land and as early as 1843 founded the town of Punta Arenas (Magallanes) on the Strait of Magellan. No attempt at settlement, however,

was made by the Chilean Government north of the present boundary along the 52nd parallel of latitude and in 1881 a boundary treaty was signed which followed in the main the course of the present boundary in this region. On account of the erroneous knowledge of the topography of the boundary zone the location of the line was not definitely established until 1902 (by arbitral sentence of the king of England) and it was not until 1907 that the demarcation was completed. In 1884 the Argentine Government divided the Patagonian region south of the Negro river into four territories or *gobernaciones;* Rio Negro (capital, Viedma), Chubut (capital, Rawson), Santa Cruz (capital, Puerto Gallegos), Tierra del Fuego (capital, Ushuaia). Chilean Patagonia up until 1927 was divided into the provinces of Chiloé and Llanquihue (the latter extended somewhat farther north than the limits of Patagonia as used in this article) and the Territory of Magallanes. In Dec. 1927 the Chilean Government decreed a new arrangement of administrative divisions over the greater part of the republic and divided the Patagonian region into the province of Chiloé (capital Puerto Montt), and the territories of Aysen (capital Puerto Aysen) and Magallanes (capital Magallanes). PATANI, an administrative division of Siam, includes the seven Malay states of Nawng Chik, Patani, Jering, Yala, Sai, Raman and Ra-nge. Each retains its Malay ruler, who governs jointly with a Siamese officer under the direction of the Siamese high commissioner, and many of the ancient privileges and customs of Malay government are preserved. The total area of the combined states is about 5,000 sq.m. The country is mountainous except close to the coast. The population is about 335,000, of whom the great majority are Malays. Each state has its capital, but Patani (the headquarters of the high commissioner) is the only town of importance. Communications are poor and are chiefly by river. The area under cultivation is small except round about Patani and in Nawng Chik, where much rice is grown. Tin mining is a growing industry; many Chinese own mines and several European syndicates are at work prospecting for, or mining, this metal. Fishing and salt-evaporation occupy a large proportion of the population. The annual export of tin is about 400 tons, and dried fish, salt, cattle and elephants are other exports. Steamers up to 300 tons maintain frequent communication with Bangkok and Singapore, and the Patani roads afford good anchorage at all seasons. Mohammedan law is followed in the settlement of inherited property disputes and of matrimonial affairs; otherwise the laws of Siam obtain. Law courts have been established in each state, and there is a force of gendarmerie recruited from amongst Malays and Siamese alike. The revenue amounts to about 600,000 ticals, or £45,000 a year, one-third being payable to the rulers as private income for themselves and their relatives, one-third expended on the administration, and one-third reserved for special purposes, but usually also devoted to administration.

PATARENES or PATARELLI, a name apparently first used in Milan about 1058 to denote the extreme opponents of clerical marriages. In the 13th century the name was appropriated by the Cathari, who said it came from *pati* (to suffer), because they endured hardship for their faith but originally it was derived from *pates*, Milanese for a rag. *See* BOGOMILS.

PATAS MONKEY, a West African species of guenon monkey characterized by its large size, the foxy-red colour of the upper parts, blue face and white belly. Its scientific name is *Cercopithecus patas*. (*See* PRIMATES and GUENON.)

PATAVIUM, an ancient city of Venetia, Italy, 55 m. E. of Verona by road (mod. *Padova*, Eng. Padua, *q.v.*). One road led from it south-west to Ateste, Hostilia (where the Po was crossed) and Bononia; another east-north-east to Altinum and Concordia. It was also accessible by canals from the sea (30 m.). The old town (40 ft. above sea-level) lay on a peninsula surrounded by the Bacchiglione except on the south, where it was protected by a canal. Of the bridges which cross the canals by which Padua is now intersected, four go back to Roman times. Remains of a public building were found in the centre of the modern city, outside which lies the ancient amphitheatre, measuring 325 by 205 ft. The name of the town is probably connected with Padus (Po). Under Augustus, Patavium surpassed all the cities of the north in wealth, and in the number of Roman knights among its citizens was only equalled by Gades.

Its commercial importance was also great, being especially due to its trade in wool. The importance of Patavium as a literary centre was also considerable. Livy, Q. Asconius Pedianus and Thrasea Paetus were natives of the town; and Quintilian speaks of the directness and simplicity of their diction as *Patavinitas*, comparing it with the artificial obscurity of the writers of Rome.

After the 2nd century A.D. it seems to have been outstripped by Milan and Aquileia. It was destroyed by the Lombards (601) and lost all its Roman monuments.

PATAY, BATTLE OF (1429). King Henry V. of England died in August 1422, and though after his death the English won several battles, the siege of Orléans, in 1428, saw a turn of the tide due to the smallness of the English army, its dispersion, the uncertain support of the Burgundian faction, and the enthusiasm aroused by the appearance of Joan of Arc.

In February 1429, accompanied by six men-at-arms, the Maid set out for the dauphin's court at Chinon. Having convinced him of her divine mission, clothed in a coat of mail and carrying a sword, said to have belonged to Charles Martel, she headed for Orléans. The siege was badly maintained, the English force being far too small for the purpose. In place of raising the siege and meeting Joan and her 5,000 followers, the English held on, with the result that their lines were broken, for all the French garrison required was enthusiasm to rouse them into activity. Suffolk, a most incapable leader, then distributed his army in small detachments to hold certain towns on the Loire, namely, Jargeau, Meung and Beaugency, and this in spite of the fact that Bedford, the regent, was sending him reinforcements from Paris under Lord Talbot. The garrisons of these towns, utterly demoralized by superstitious terror, surrendered them, and Talbot hearing of these disasters determined to retreat to Paris and hold the city. At Patay on June 18 he was surprised by Joan and her captains the Duke of Alençon and Lahire. The English archers, who throughout the Hundred Years' War had depended for their success on defensive tactics, attempted to fix their stakes and deploy behind them, but the French fired by a religious enthusiasm gave them no time, and charging down on them slew more than a third and captured Talbot. The strategical results of this victory were great; not only were the English driven beyond the Loire, but Charles, the dauphin, took Chalons, Troyes and Reims, and entering the last mentioned city at the head of 12,000 men was crowned king of France. The moral effect was still greater, because Bedford, fearing the demoralizing influence of the Maid's miraculous banner, dared not take the offensive.

See A. Lang, *The Maid of France* (1908); Michelet, *Histoire de France;* C. Oman, *The Art of War in the Middle Ages* (1924). (J. F. C. F.)

PATCHOGUE, a village of Suffolk county, New York, U.S.A., on Great South bay on the south shore of Long Island, 50 m. E. of the Brooklyn Borough Hall; served by the Long Island railroad. Pop. (1925) 5,116 (State census). The village ships large quantities of fish and oysters, is an important trading centre and has a number of factories. It was founded in 1665 and incor-

porated in 1893.

PATEL, FRAMJEE NASARWANJEE (1804–1894), Parsee merchant and philanthropist, was born in 1804, and received a vernacular education, with a little English in Bombay. In 1819 he entered upon a business career, and in 1827 became a partner in the firm of Frith, Bomanjee & Co. Banking facilities being then exceedingly scanty, such Parsees as had any capital at command acted as bankers and brokers to the rising English firms. Patel raised the status of his compatriots to the higher level of independent merchants, and he founded in 1844 a business house under the name of Wallace & Co., from which he retired in 1848 to found in 1849 Framjee, Sands & Co.

Patel's most remarkable public service was performed in connection with the Parsee Law Association, of which he was president. The domestic affairs of the Parsees having fallen into confusion since their exodus from Persia, the adjudication of disputes relating to matrimonial obligations and the rights of succession in cases of intestacy, was left to the elders of the community who lacked both knowledge and principles on which to base their judgment, and the authority to enforce their decisions. The case of *Ardesir Cursetjee* v. *Peeroxebai*, which came up on appeal before the privy council in England, brought to light the fact that the supreme court of Bombay had no jurisdiction over matrimonial and ecclesiastical disputes among Parsees. This state of lawlessness being recognized as intolerable, agitation ensued which led to the appointment of a commission, of which Sir Joseph Arnould was the president and Framjee Patel the chief Parsee member. The Parsee Law Association, under the guidance of Patel and Sorabjee Bengallee, rendered invaluable help to the commission, and their joint efforts resulted in the passing by the government of India of the Parsee Marriage and Divorce Act and the Parsee Intestate Succession Act (15 and 21 of 1865). These acts form the charter of matrimonial and ecclesiastical status for the Parsees.

At the time of his death in 1894, Framjee Patel was the most revered and best beloved of the distinguished natives of India, having during an eventful public life extending over sixty years worked in co-operation with three generations of the most prominent of his compatriots to better the condition of their country. His family surname refers to the title of *patel*, that is, "mayor," of Bombay, conferred on its founder for services rendered to the English in 1692. (M. M. Bh.; X.)

PATENTS, properly documents conferring some privilege, right, etc., short for "letters patent" (*q.v.*). Patents for inventions, instruments which formerly bore the great seal of the United Kingdom, are now issued at the Patent Office in London under the seal of that office. By their means inventors obtain a monopoly in their invention for 16 (formerly 14) years, a term which, if insufficient to remunerate the inventor, may be extended.

ENGLISH PATENTS

Formerly the reigning prince considered himself entitled, as part of his prerogative, to grant privileges of the nature of monopolies to any one who had gained his favour. These grants became so numerous that they were oppressive and unjust to various classes of the commonwealth; and hence, in the reign of James I., a statute was wrung from that king which declared all monopolies that were grievous and inconvenient to the subjects of the realm to be void. (*See* Letters Patent; Monopoly.) There was, however, a special exception from that enactment of all letters patent and grants of privileges of the "sole working or making of any manner of new manufactures within the realm to the true and first inventor and inventors of such manufactures which others at the time of making such letters patents and grants shall not use, so as also they be not contrary to the law nor mischievous to the State by raising of the prices of commodities at home or hurt of trade or generally inconvenient." Upon these words hangs the whole law of letters patent for inventions. Many statutes were afterwards passed, but these were all repealed by the Patent Act of 1883 (46 and 47 Vict., c. 57) which modified the law in several particulars. There were subsequently several Amending Acts, which with certain savings were repealed by a Consolidating Act, the Patents and Designs Act 1907, which also introduced new provisions into English patent law. It was slightly amended in 1914 (apart from War legislation) and has been substantially amended by the Patents and Designs Act 1919. A further amendment has been made by the Patents and Designs (Convention) Act, 1928.

Patentable Inventions.—The inventions for which patents are obtained are chiefly either vendible articles formed by mechanical or chemical operations, or machinery and apparatus or processes. It may be remarked here that a scientific principle cannot form the subject of a valid patent, but its application to a practical and useful end and object may do so. An abstract notion, a philosophical idea, may be extremely valuable in the realm of science, but before it is allowed to form a sound basis for a patent the world must be shown how to apply it so as to gain therefrom some immediate material advantage.

The principal classes of patentable inventions seem to be these: (1) new contrivances applied to new ends, (2) new contrivances applied to old ends, (3) new combinations of old parts, whether relating to material objects or processes, (4) new methods of applying a well-known object. In the case of inventions relating to substances prepared or produced by chemical processes or intended for food or medicine a claim cannot be made for the substance itself, except when prepared or produced by the special methods or processes of manufacture described and claimed or by their obvious chemical equivalents (Act of 1919 s. 11).

With regard to a patent for the new application of a well-known object it may be remarked that there must be some display of ingenuity, some amount of invention, in making the application, otherwise the patent will be invalid. For example, a fish-plate, used before the introduction of railways to connect wooden beams, could not be patented to connect the rails of a railway (*Harwood* v. *Great Northern Railway Co.*, 1860–65, 11 H.L.C. 654) nor can a spring long used in the rear of a carriage be patented for use in the front (*Morgan* v. *Windover*, 1890, 7 R.P.C. 131). But a small amount of invention will suffice, so long as the improvement is manifest, either as saving time or labour or having other utility (*Rickmann* v. *Thierry*, 1896, 14 R.P.C. 105: *Patent Exploitation Ltd.* v. *Siemens and Co.*, 1904, 21 R.P.C. 549: *Teste* v. *Coombes*, 1923, 41 R.P.C. 88).

Whatever be the nature of the invention, it must possess the incidents of utility and novelty, otherwise any patent obtained in respect of it will be invalid. The degree of utility need not, however, be great. Commercial success is not necessary but may be an important item in considering whether there was invention. The affording of a new and useful choice of means for effecting a known object is sufficient. As to novelty, if it can be shown that other persons have used or published the invention before the date of the patent, it will fall to the ground, although the patentee was an independent inventor deriving his ideas from no one else. Thus, where the patent sued on was for a lock, it was proved that a similar lock had been in use on a gate adjoining a public road for 16 years prior to the patent, which was accordingly invalidated (*Carpenter* v. *Smith*, 1842, I. Web. P.C. 540). It is sometimes a subject of enquiry whether an invention has so been previously used as to have been publicly used in the sense attached by the courts to this phrase. The mere use of an apparatus in a car driven along a public way, without opportunity for any one to see it, was held not to be a public user, and the use in question being a mere casual accidental use in the course of a different investigation was held not to be an anticipation (*Boyce* v. *Morris Motors Ltd.*, 1927, 44 R.P.C. 105). But whereas "user" in public is sufficient prior publication to invalidate a subsequent patent for the invention so used, publication in books, etc., will not be a bar to novelty unless its effect is to make the invention actually a part of public knowledge; and in dealing with alleged anticipations by specifications of patents for inventions that have never come into general use it has been said that a patent will not be invalidated unless a person of ordinary knowledge of the subject, on having the alleged anticipation brought under his notice, would at once perceive, understand, and be able practically to apply the invention without making experiments or seeking for further

information. But while this is the text to be applied in considering whether a specification is sufficient in respect of working directions, an invention may be sufficiently published if the document alleged to anticipate is sufficient to convey to men of science and employers of labour information which will enable them without any exercise of inventive ingenuity to understand the invention and to give a workman the specific directions necessary to carry it out (*King, Brown & Co.* v. *Anglo-American Brush Co.*, 1892, A.C. 367, p. 378, *Savage* v. *Harris*, 1896, 13 R.P.C. 364, at p. 368). The inventor himself, by the use of his invention even in secret, with a view to profit, may, it would seem, invalidate the patent. Thus, if he manufactures an article by some new process, keeping the process an entire secret, but selling the produce, he cannot probably afterwards obtain a patent in respect of it. If he were allowed to do this, he might in many cases easily obtain a monopoly in his invention for a much longer period than that allowed by law (*Morgan* v. *Seaward*, 1837, 1. Web, P.C. 192). The sale of the article may, of course, involve the publication of the invention. The rule that an inventor's use of the invention invalidates a subsequent patent does not, however, apply to cases where the use was only by way of experiment with a view to improve or test the invention (*Elias* v. *Grovesend Tinplate Co.*, 1890, 7 R.P.C. 466).

S. 45 of the Patents Act 1907 provides that the exhibition of an invention at an industrial or international exhibition certified as such by the Board of Trade, or the publication of any description of the invention during the period of the holding of the exhibition, or its use for the purpose of the exhibition in the place where it is held, or during the period of the exhibition by any person elsewhere, without the privity or consent of the inventor, shall not prejudice the right of the inventor or of his legal personal representative to apply for and obtain a patent, or the validity of any patent granted on the application, provided that two conditions are complied with, viz., (a) the exhibitor must, before exhibiting the invention, give the comptroller-general a prescribed notice of his intention to do so; and (b) the application for the patent must be made before or within six months from the date of the opening of the exhibition. A like saving has been given by the Act of 1919 to the reading of a paper by an inventor before a learned society and to the publication of the paper in the society's transactions subject to a like provision as to notice by the person reading such paper or permitting such publication and as regards (c) the substitution of the date of the reading or publication of the paper for that of the opening of the exhibition.

When an invention is the joint production of more persons than one, they must all apply for and obtain a joint patent, for a patent is rendered invalid on showing that a material part of the invention was due to some one not named therein. But under some circumstances the patent may be actually granted to one or more of the joint applicants. The mere suggestion of a workman employed by an inventor to carry out his ideas will not require that he should be joined, provided that the former adds nothing substantial to the invention, but merely works out in detail the principle discovered by his employer.

Procedure.—The Patents Act 1907, re-enacting former provisions, requires an application to be made in a prescribed form (the forms and stamps are on sale at all postal money order offices in the United Kingdom) and left at or sent by post to the patent office in the prescribed manner. The application must contain a declaration that the applicant is the true and first inventor, and it must be accompanied by either a provisional or complete specification. A provisional specification describes the nature of an invention, and a complete specification particularly describes and ascertains the nature of the invention and the manner in which it is to be performed and must end with a distinct statement of the invention claimed. Since the introduction of the patent specification, it has been necessary that an invention protected by patent should be accurately described by the inventor. The task of preliminary disclosure falls to the provisional specification introduced by the Patent Law Amendment Act 1852 and continued by the later Acts, but an applicant may dispense with a provisional specification if he thinks proper to file a complete one in the first instance. Where, however, these two specifications are filed, it becomes of vital moment to an inventor that the true relation between them should be maintained as defined above. The object of the provisional specification is to secure immediate protection, and to enable a patentee to work at and improve his invention without the risk of his patent being invalidated by premature publication. He is therefore entitled to embody in his complete specification any improved method of working his invention which he may discover in the interval; and he is indeed bound to do so, since, as we have said, the price that a man who desires a patent has to pay to the public for the privilege is that he should make a full disclosure of his invention in his complete specification. But there is a limit to what the patentee may do in this respect. He must not describe in his complete specification an invention not substantially the same as that declared in the provisional. If he falls into this error there is said to be a "variance" or "disconformity" between the two specifications. It is by s. 6 of the Patents Act 1907 made the duty of the examiner of the Patent Office to consider the question of disconformity between specifications on applications for patents, and, if he reports that there is disconformity, the comptroller may refuse to accept the complete specification until it has been amended to his satisfaction, or (with the consent of the applicant) cancel the provisional specification and treat the application as having been made on the date at which the complete specification was left. Moreover, if the complete specification includes an invention not included in the provisional specification, the application may be divided, and the claim for the additional invention included in the complete specification be regarded as an application for that invention made on the date at which the complete specification was left. After a complete specification has been left, an examiner makes an examination or search as to novelty, such investigation dealing with British complete specifications published and dated within 50 years prior to the date of the application (Act of 1907, s. 7) and power is given to the comptroller to refuse the grant of a patent in cases in which the invention had been wholly and specifically claimed in specifications to which his search had extended. If it is wholly or partly so claimed or described, he may require a reference to be made to the prior specification. Opportunities of amendment are, however, given to an applicant. When a complete specification has been accepted, the acceptance is advertised, and the specification is open to inspection, and the grant may be opposed on certain grounds, some of which are personal to the opponent.

The term for which a patent is originally granted is now 16 years and by the Patents Act 1919 the terms of existing patents were extended to that length subject to certain conditions (s. 6). A patentee may, after advertisement according to the rules of the Supreme Court, apply for an extension of the original term. The court, in considering its decision, pays regard to the nature and merit of the invention in relation to the public, of the profits made by the patentee as such, and of all the circumstances of the case. If it appears to the court that the patentee has been inadequately remunerated by his patent, it may extend the term of the patent to a further term not exceeding five, or, in exceptional cases, ten years, or may order the grant of a new patent for a certain term, with any restrictions or provisions it may think fit (Act of 1907, s. 18, and Act of 1919, s. 7). Loss or damage suffered by the patentee by reason of hostilities between His Majesty and a foreign State affords a special ground for extension (Act of 1919, s. 7).

A patentee may elect to have his patent endorsed "licences of right," with the result that any person may thereafter claim to have a licence under it on terms fixed by agreement or settled by the comptroller. The advantage to the patentee is that renewal fees are halved.

The Act of 1907.—A very useful new feature was introduced by the Act of 1907 by the provision as to patents of addition. An applicant for a patent or a patentee may apply for a further patent in respect of any improvement in or modification of his invention and request that the term limited in the new patent be the same as that of the original patent or so much of that term as is

unexpired. The new patent, if granted, becomes a patent of addition remaining in force only so long as the original patent, and has the advantage that no renewal fees are payable. If the original patent is revoked, the patent of addition may be ordered to become an independent patent, and the fees payable and the dates when they shall become payable are to be determined by its date, but its duration is not to exceed the unexpired term of the original patent (s. 19 of the Act of 1907 as amended by the Act of 1919).

Patent privileges, like most other rights, can be made the subject of sale. Partial interests can also be carved out of them by means of licences, instruments which empower other persons to exercise the invention, either universally and for the full time of the patent (when they may be tantamount to an assignment of the patentee's entire rights) or for a limited time, or within a limited district. By an exclusive licence is meant one that restrains the patentee from granting other licences to any one else. By means of a licence a patentee may derive benefit from his patent without entering into trade and without running the risks of a partnership.

One of the regulations of the Act of 1883 was that a patentee could be compelled by the Board of Trade to grant licences to persons who were able to show that the patent was not being worked in the United Kingdom, or that the reasonable requirements of the public with respect to the invention could not be supplied, or that any person was prevented from working or using to the best advantage an invention of which he was possessed. This regulation, however, remained practically a dead letter. By s. 3 of the Act of 1902, the hearing of petitions for a grant of compulsory licences was transferred to the Judicial Committee of the Privy Council, but the Act of 1907 substituted the High Court as the tribunal in the place of the judicial committee. The Act introduced considerable amendments in the law as to the grant of compulsory licences which, as stated below, have now been replaced by provisions in the Act of 1919. S. 38 of the Act of 1907 contains also a further remedy for the improper exercise of patent rights, making it unlawful in any contract in relation to the sale or lease of, or licence to use or work, any patented article or process to insert conditions prohibiting or restricting the use of articles supplied by a third person or requiring the purchaser or lessee to acquire from the seller or lessor other articles not protected by the patent. Such conditions are declared "null and void as being in restraint of trade and contrary to public policy."

Another new and very important provision of the Act of 1907 was that dealing with the revocation of patents worked outside the United Kingdom. It had been a common practice to take out patents in the United Kingdom (especially in the dyeing industry) in order to close the British market to all except the patentees and their licensees, the patented articles or processes being worked entirely abroad. S. 27 of the Act of 1907 enacted that at any time not less than four years after the date of a patent any person might apply to the comptroller for the revocation of a patent on the ground that the patented article or process was manufactured or carried on exclusively or mainly outside the United Kingdom. The comptroller was given power to make an order revoking the patent forthwith or after a reasonable interval, unless the patentee could show satisfactory reasons.

The Act of 1919 substituted new provisions for those contained in the Act of 1907 as to compulsory licences and the revocation of patents worked outside the United Kingdom, such matters being now treated under the heading of provisions being for the prevention of abuse of monopoly rights. (S. 1 enacting a new s. 27.) Those rights are to be deemed to have been abused in any of five sets of circumstances which may be shortly stated as follows:—(a) After the fourth year of the patent, non-working of the invention in the United Kingdom on a commercial scale and without a satisfactory reason for such non-working. (b) Working of the invention within the United Kingdom on a commercial scale prevented or hindered by importation from abroad of the patented article by the patentee or persons claiming under or through him or by other persons against whom he is not taking proceedings for infringement. (c) If the demand for the patented article in the United Kingdom is not being met to an adequate extent or on reasonable terms. (d) If by refusal of a licence or licences the trade or industry of the United Kingdom or the trade of any person or class of persons in the United Kingdom, or the establishment of any new trade or industry in the United Kingdom is prejudiced and it is in the public interest that a licence or licences should be granted. (e) If any trade or industry in the United Kingdom, or any person or class of persons engaged therein, is unfairly prejudiced by conditions attached by the patentee before or after the Act, to the purchase, hire, license or use of the patented article or the using or working of the patented process.

Any person interested may at any time apply to the comptroller for relief under the section, alleging in the case of any patent an abuse of the monopoly rights. Under (a), which does not apply to an invention not capable of being worked in the United Kingdom, power is given to the comptroller to adjourn the application if he is of opinion that the time which has elapsed since the date of the patent has been insufficient to enable the invention to be worked within the United Kingdom on a commercial scale. The section contains the important statement that for the purpose of determining whether there has been any abuse of monopoly rights, it shall be taken that patents for new inventions are granted not only to encourage invention but to secure that new inventions shall so far as possible be worked on a commercial scale in the United Kingdom without undue delay. "Working on a commercial scale" means the manufacture of the article or the carrying on of the process described and claimed in a specification of a patent in or by means of a definite and substantial establishment or organization, and on a scale which is adequate and reasonable under all the circumstances. Relief may be given under the section by the exercise by the comptroller of any of the following powers, stating them shortly:—(a) He may order the patent to be endorsed "licences of right" (*see* above); (b) he may order the grant to the applicant of a licence on such terms as he may think expedient; (c) he may, if he is satisfied that the invention is not being worked on a commercial scale within the United Kingdom, and under specified circumstances, requiring capital, order the grant of an exclusive licence to the applicant or a person able and willing to provide such capital subject as provided in the section; (d) he may, if satisfied that the objects of the section cannot be attained by any of the foregoing methods, order the patent to be revoked either forthwith or after an interval unless conditions prescribed in the order are fulfilled, but no such order is to be made which would be at variance with any treaty, convention, arrangement or engagement with any foreign country or British possession; (e) if he is of opinion that the objects of the section will be best attained by making no order, he may refuse the application. Under (a) an existing licensee may apply for an order entitling him to surrender his licence in exchange for one to be settled by the comptroller. Under (b) a licensee may call on the patentee to take proceedings to prevent infringement and in default by the patentee may himself institute such proceedings. The course to be taken by the comptroller if he is satisfied that the applicant has a *bona fide* interest and the procedure is laid down by the section. There is a right of appeal from the comptroller to the court. By consent, or under specified circumstances, the comptroller can order the proceedings or any question or issue of fact to be referred to an arbitrator, with a similar right of appeal. "Patented article" includes articles made by a patented process.

Legal Remedies.—A patentee's remedy for an infringement of his rights is by civil suit, there being no criminal proceedings in such a case. No proceedings can be taken in respect of an infringement committed before the acceptance of the complete specification (s. 13 of Act of 1907 as amended by Act of 1919). In prosecuting such a suit the patentee subjects those rights to a searching examination, for the alleged infringer is at liberty to show that the invention is not new, that the patentee is not the true and first inventor, etc., as well as to prove that the alleged infringement is not really an infringement. But it may here be remarked that a patentee is not bound down (unless he has chosen so to be) to the precise mode of carrying the invention into effect described in the specification. If the principle is new, it is not to be expected

that he can describe every mode of working it; he will sufficiently secure the principle by giving some illustrations of it; and no person will be permitted to adopt some mode of carrying the same principle into effect on the ground that such mode has not been described by the patentee. On the other hand, when the principle is not new, a patentee can only secure the particular method which he has invented, and other persons may safely use other methods of effecting the same object. Again, where the invention patented consists of a combination of parts, some old and some new, the whole constituting a new machine or a new process, it is not open to the world to copy the new part using other old parts. A man is not permitted to allege that the patent is for a combination and that, the identical combination not having been used, there has been no infringement. If he has taken the substance of the invention, it will be held that he has infringed the patent (*Clark* v. *Adie,* 2 App. Cas. 315).

In a successful action relief may be given by damages and an injunction against infringement of the patent, but a defendant who proves that at the date of the infringement he was not aware nor had reasonable means of making himself aware of the existence of the patent is not liable to damages.

At common law a person who, alleging that he has a patent, threatens his rivals in trade, is liable to an action for damages, but the plaintiff cannot succeed without showing that the threats were made maliciously. The Patents Act 1907 s. 36 provides another remedy in what is known as "the threats action." The statute makes the good faith of the patentee threatening legal proceedings no answer to an action brought against him by any person aggrieved by his threats if the acts complained of are not in fact an infringement of the patent; but if an action for infringement is commenced and prosecuted with due diligence, the section does not apply.

Extent and Construction.—The patent when sealed has effect in the United Kingdom and the Isle of Man. The patent business of the United Kingdom is transacted at the Patent Office in London under the superintendence of the comptroller, an officer appointed by the Board of Trade, under whose direction he performs his duties. At this office is kept a register of all patents issued, of assignments of patents, licences granted under them, etc. An illustrated journal of patent inventions is published at the same office, where printed copies of all specifications can also be obtained. The fees payable to government on patents are those laid down by the Patents Rules and are as follows:—On application accompanied by provisional specification £1; on filing complete specification thereafter £3; on application accompanied by complete specification £4; on sealing of patent £1. Before the expiration of the fourth year from the date of the patent £5; of the fifth year £6; of the sixth year £7, and so on increasing by £1 every year, each such payment being in respect of the following year. Where an extension of time is given, extra fees are payable.

The official publications of the Patent Office deserve some notice, as, apart from official investigation into novelty, the onus of search rests with the applicant or his agent. The procedure has been greatly simplified by the publication, on a uniform system and at a low rate, of illustrated abridgments of specifications. From 1877 practically to date the searcher obtains a chronological digest of all specifications falling within a given class. To these classes there is a reference index, known as the "abridgment class and index key," which at once directs the searcher to his proper class and index heading. The office also publishes reports of Patent, Design and Trade Mark Cases, the reference to which is R.P.C.

Patent Agents.—Patents are usually, although not necessarily, obtained through the intervention of "patent agents" who devote themselves to this branch of business. Their position has for many years been regulated by statute. The existing enactment which is more stringent than that which it displaced is the new s. 84 of the Patents and Designs Act, 1907, substituted for the original section 84 by s. 18 of the Act of 1919. It provides that no person shall practise, describe himself, or hold himself out, or permit himself to be described or held out, as a patent agent, unless:—(a) In the case of an individual he is registered as a patent agent in the register of patent agents; (b) in the case of a firm every partner of the firm is so registered; (c) in the case of a company which commenced to carry on business as a patent agent after Nov. 17, 1917, every director and the manager (if any) of the company is so registered; (d) in the case of a company which commenced to carry on business as a patent agent before that date, a manager or a director of the company is so registered. In the last mentioned case the name of such manager or director must be mentioned as being a registered patent agent in all professional advertisements, circulars or letters in which the name of the company appears. There is a provision which enabled any individual not registered as patent agent before July 15, 1919, to be registered on proof that before Aug. 1, 1917, he was *bona fide* practising as a patent agent. The penalty for contravention of the provisions is a maximum sum of £20, and in the case of a company any officer knowingly a party to the contravention is liable. "Patent Agent" means a person, firm or company carrying on for gain in the United Kingdom the business of applying or obtaining patents in the United Kingdom or elsewhere. Unless registered before July 15, 1919, a person cannot be registered unless he is a British subject. The Board of Trade has power under s. 86 to make rules for regulating the keeping of the register of Patent Agents and has delegated this duty to the Chartered Institute of Patent Agents. Notwithstanding these provisions an ordinary agent duly authorized to the satisfaction of the comptroller may be employed in some matters (but not including the signing of applications for patents and certain other documents which must be signed by the applicant himself; *see* s. 85 and Rule 9).

BRITISH DOMINIONS

The following notes on the laws of the Dominions give the salient facts. Prior to 1852 British letters patent extended to all the colonies, but the Act of 1852 restricted the rights granted to the United Kingdom, Channel islands and the Isle of Man. The present Acts extend to the United Kingdom (including Northern Ireland) and the Isle of Man. As to the Dominions which are parties to the International Convention, *see* p. 373, *International Convention.*

Protection is obtainable in a number of the smaller dominions by way of the registration of the British letters patent. There is a limit of three years from the date of the sealing of the British letters patent within which to apply in most of the countries. The dominions in which such protection can be obtained are:—Bermuda, British Guiana, British Honduras, British North Borneo, British Solomon isles, Brunei, Cyprus, Falkland isles, Fiji isles, Gambia, Gibraltar, Gilbert and Ellice isles, Gold Coast, Grenada, Guernsey, Hong Kong, Jersey, Johore, Kenya, Leeward isles, Federated Malay States, Mauritius, Nigeria, Palestine, Northern Rhodesia, St. Helena, St. Lucien, St. Vincent, Sarawak, Siam, Sierra Leone, Somaliland, Straits Settlements, Uganda and Zanzibar.

Australia.—The Commonwealth Acts are No. 21 of 1903, No. 19 of 1906, No. 17 of 1909, No. 10 of 1910 (as to administration) and No. 24 of 1921. They are founded on the English Act of 1883 and amending Acts.

They provide for a department of patents controlled by a commissioner "under the minister" (s. 10 of 1903). Any person, whether a British subject or not, may apply for a patent. There is an examination as to the novelty (s. 41 of 1903). The term of a patent is 16 years (s. 3 of 1921). The Commonwealth or a State may acquire patents compulsorily (ss. 93, 94 of 1903). Provisional patents (9 months) may be obtained. There are provisions as to non-working to an adequate extent in the Commonwealth (not enforceable until 4 years from the date of the patent have expired), provisions as to compulsory licences and provisions corresponding to those of s. 38 of the British Act of 1907, avoiding certain conditions attached to the sale, etc., of patented articles (s. 87 A added by s. 15 of 1909). International arrangements are dealt with in s. 121 of the Act 1903, as amended by s. 5 of the Act of 1921. The fees payable are: on application, £1; on acceptance of complete specification, £2; on grant, £5; and £5 before the end of the seventh year.

Canada.—Patent legislation belongs exclusively to the Dominion parliament (B.N.A. Act, 1867, s. 91 [22]). The existing Act is the consolidating Act called "The Patent Act" (c. 23 of 1923). The duration of a patent is 18 years. The fee on application is $15 and within six months after notice of allowance $20; there are no subsequent fees. The Patent Office is under the control of the commissioner for patents. A Patent may be obtained if the invention was new when made and has not been patented or described in any printed publication in Canada or any foreign country more than two years prior to the application and has not been in public use or on sale in Canada more than that period (s. 7). Applications by persons who have obtained or applied for a patent in a foreign country, and who wish to obtain priority of date of such application, are regulated by s. 8. There are provisions as to inventions relating to substances prepared or produced by chemical process and intended for food or medicine similar to those of the British Act (s. 17). A patent is void, in whole or in part, if obtained on an untrue statement, or if the specification has an omission or added statement which is wilfully misleading (s. 31). A patentee must adequately manufacture the patented article or carry on the patented process in Canada, otherwise compulsory licences may be ordered, but not until three years from the date of the patent have expired; after the same period a patent may be revoked if the patented article or process is manufactured or carried on exclusively or mainly outside Canada (ss. 40, 41). Patented articles sold by the patentee are required to be marked or labelled with the year of the date of the patent (s. 51). A register of attorneys is kept at the Patent Office (s. 57). Appeals from the commissioner under the Act are to the exchequer court (s. 62).

India.—The Act in force is the Indian Patents and Designs Act 1911, with amending Acts of 1915, 1920 and 1923. The Act of 1920 relates to reciprocal arrangements with the United Kingdom and other parts of His Majesty's dominions. The Act of 1911 appears to be founded on the British Patents and Designs Act 1907 and contains provisions as to compulsory licences if the reasonable requirements of the public are not satisfied. The term of a patent is 14 years which may, in proper cases, be extended by seven or, in exceptional cases, 14 years. The fees are: on filing, 10 R.; on sealing, 30 R.; before commencement of each of fifth to ninth years, 50 R., and of each of tenth to fourteenth years, 100 R.

Irish Free State.—The patent law is contained in the Industrial and Commercial Property (Protection) Act 1927. The provisions of the Act, so far as regards patents, are, in the main, on the same lines as the British Patents and Designs Act 1907 as amended by the Act of 1919, including the provisions as to the abuse of monopoly. The term of a patent is 16 years. A British patent, existing at the date of the Act (Oct. 1, 1927) is to be deemed to be a patent granted under the Act as of the date the patent actually bears, but, to be effective, must be validated. The fees are: on application, £3; on sealing, £1; before and after the fourth year, £3.15.0, increasing, by 15s. annually, to £12.

New Zealand.—The Acts in force are the Patents, Designs and Trade Marks Act, 1921 (No. 18 of 1921) and an amending Act (No. 40 of 1924) containing provisions for patents, endorsed "licences of right" and for prevention of abuse of monopolies, similar to those in the British Act of 1919. Generally speaking, the statutory law now corresponds closely to that of British Acts. The term of a patent is 16 years. The fee, on application with provisional specification, is £1 or, with complete specification, £2; on sealing, £1, and before the expiration of third year, £3; before that of the sixth year, £6.

Newfoundland.—The law is contained in an Act passed on Sept. 6, 1927. The term of a patent is 14 years.

South Africa (Union of).—The law as to patents is governed by the Patents, Designs, Trade Marks and Copyrights Act 1916. The term of a patent is 14 years. Compulsory licences may be granted if the reasonable requirements of the public are not satisfied, or the patent may be revoked, but not until three years from the date of the patent have expired. "Inventor," as defined, does not include a person importing an invention from outside the Union, but an assignee of an inventor may apply for a patent. By s. 41(2) the grant of a patent for an invention to an inventor or his assignee or legal representative outside the Union is not a bar to a grant of a patent for the same invention within the Union to the same person, provided that an application is made within 12 months of the date of application for the foreign patent; but the subsection only applies to a foreign country as to which a proclamation has been made. Such a proclamation was made as to the United Kingdom on July 1, 1918, on which date an Order in Council was made applying s. 91 of the British Act of 1907 to the Union. At present the provision is only applicable to the United Kingdom, Canada, India, Australia, New Zealand, Irish Free State and the United States of America. The fees are: on application, £4; on sealing, £1; before commencement of third year, £4; seventh year, £6; and tenth year, £10.

UNITED STATES

Article 1, sec. 8 of the Constitution of the United States provides that Congress shall have power "to promote the progress of science and the useful arts by securing for limited times to authors and inventors the exclusive rights to their respective writings and discoveries." The first act of Congress, passed April 10, 1790, placed the granting of patents in the hands of the secretary of State, the secretary of War and the attorney general. Thomas Jefferson, as secretary of State, personally examined many petitions for patent. By act of July 4, 1836, the Patent Office was established under a commissioner of patents and the present general outline of the patent law fixed. When the Department of the Interior was established by act of March 3, 1849, the Patent Office was transferred to its jurisdiction. On April 1, 1925, it was, by executive order of President Coolidge, transferred to the Department of Commerce under Secretary Hoover.

Theory of the Law.—A patent is in substance a contract between the Government, representing the public, and the inventor, under which the inventor discloses to the public by an adequate specification an invention, which he might otherwise have kept secret, so that the public may benefit by the disclosure and freely use the invention after the patent has expired. In consideration of this disclosure the Government grants a 17-year monopoly to the inventor, whose invention would otherwise have become public property, under the common law, immediately on its disclosure.

Nature of the Monopoly.—The patent grant creates a right to exclude others from making, using or selling any embodiment of the patented invention during the life of the patent. "A patent secures to the patentee the right to debar others from making the thing patented, but it does not confer upon him the right to make it. That he could do (though not exclusively) without a patent." (*Pegram* v. *American Alkali Co.*, 122 Fed. 1,000–1,005.)

To Whom Granted.—Patents are granted to the first inventor, or to his executor or administrator in trust for his heirs or devisees, or, if he be insane, to his guardian, conservator or representative in trust for his estate. If one employs another to develop the details of his invention the patent still belongs to the employer.

Subjects of Patents.—Not every new thing is patentable. Patents are granted for new and useful inventions or discoveries, or new and useful improvements thereof, and for new, original and ornamental designs for an article of manufacture. An invention or discovery, to be patentable, must be within one of four classes enumerated by the statute, *i.e.*, an art, a machine, a manufacture or a composition of matter. An "art" is a process or method, and has been defined by the Supreme Court to be "a

mode of treatment of certain materials to produce a given result." (*Cochrane* v. *Deener,* 94 U.S. 780.) "Manufacture" means an article of manufacture. "New" means not patented or described in any printed publication in this or any foreign country before the invention or discovery thereof by the applicant for the patent, or more than two years prior to his application for a patent thereon. Public use or sale of the invention in the United States by the inventor or others any time more than two years prior to the inventor's application for a patent renders the invention public property and bars the grant of a valid patent thereon. "Useful" means capable of use, or operative, and the degree of usefulness is immaterial, except in close cases, in which commercial success is sometimes persuasive on the point of patentability.

Term of Letters Patent.—Patents for inventions run for 17 years from the date of issue (as distinguished from the date of application, which controls in most other countries). Patents for designs run for 3½, 7 or 14 years, according to the term asked and fee paid. Patents can be extended only by special act of Congress, except that a patentee who "served honorably in the military or naval forces of the United States at any time between April 6, 1917, and Nov. 11, 1918, and was subsequently honorably discharged" may have, between May 31, 1928, and Nov. 30, 1928, applied for an extension of his then existing patent for a term not exceeding three times the period of his enlistment (act of May 31st, 1928). Patents may be obtained for improvements on a prior patented invention, if additional invention was involved in making the improvement, but this does not extend the term of the original patent, and the improvement cannot be made, used or sold without consent of the owner of the earlier patent.

Procedure in Granting Patents.—Applications must be signed and sworn to by the inventor, or by his executor or administrator, if deceased, or by his guardian, if insane. A drawing must be filed if the invention is capable of illustration by a drawing. Models are rarely required. The best embodiment of the invention known to the applicant must be described fully in the specification ending in a claim or claims which "particularly point out and distinctly claim the part, improvement or combination which he claims as his invention or discovery." The claims constitute the most important part of the application and should be drawn by an expert attorney to define all the novel features or combinations of elements disclosed, and no more. An application may be amended from time to time before allowance, so long as the scope of the original disclosure is not exceeded. The Patent Office examiners make an extensive examination of the prior art to determine the margin of novelty in the matter claimed and reject all claims found to be anticipated or informal. Appeals are possible from such rejection to a board of appeals and from it to the courts. If two or more separate applications are filed for patents covering the same feature of invention, an interference is declared and testimony may be taken on which the Patent Office will grant the claim in controversy to the party found to be the first inventor, provided it does not appear that he has lost his rights by inexcusable inactivity. An interference proceeding may also be had between an application and an issued patent if the applicant filed his claim within two years after the grant of the interfering patent. If the applicant proves to have been the first inventor a second patent will be issued to him. When two issued patents interfere, the one erroneously granted can be cancelled by a U.S. court.

Assignments of Patent Rights.—The whole patent, or an undivided interest therein, or the exclusive right for a given territory, may be assigned in writing. Such assignment should be acknowledged before a notary public, U.S. commissioner, secretary of legation or consular officer authorized to administer oaths, to constitute *prima facie* evidence of execution, though the assignment is valid without this formality. If not recorded in the Patent Office within three months after execution an assignment is void as against any subsequent purchaser or mortgagee for a valuable consideration who is without notice of such earlier assignment. If an assignment of an interest in an invention is recorded before the final fee is paid on the application claiming it, the patent will issue to the assignee as their interests may appear.

Certain States have laws regulating assignments of patent rights executed within their boundaries, which have been held valid by the U.S. Supreme Court as within the police powers of the States in preventing fraud. In Kansas and Indiana a certified copy of the patent and an affidavit by the seller must be filed with the clerk of the county in which the sale is effected. In these States and in New York, Georgia, Arkansas, North and South Dakota, Pennsylvania, Ohio, Tennessee, Texas and Vermont, a note or other obligation given for a patent right must have the words, "Given for a patent right," appearing on its face. In Florida, Georgia, North Carolina, Virginia, West Virginia, Wisconsin and Rhode Island, a pedlar of patent rights or of patented articles must take out a licence. The penalties for violations of these laws are fines and imprisonment. In Tennessee they constitute felonies with imprisonment mandatory of from one to five years.

A U.S. trustee in bankruptcy takes title to all rights of the bankrupt in issued patents as of the date of the adjudication in bankruptcy, but not to unpatented inventions. The receiver of a corporation appointed by a State court, however, takes only the equitable title to the patents of the corporation, and an assignment executed by an officer of the corporation is necessary to complete the legal title, or one executed in the name of the corporation by some one designated in an order of the court having jurisdiction.

Reissues.—Any patent, which is inoperative or invalid by reason of a defective or insufficient specification, or because of too broad a claim, if the error has arisen by accident or mistake and without any fraudulent intention, may be reissued for the unexpired term. The application must be signed and sworn to by the inventor, if living. If a reissue application seeks to broaden the claim, it must be filed within two years of the grant of the original patent, unless there is a very good excuse for delay. Another remedy when a patent has too broad a claim is to limit it by disclaimer filed in the Patent Office. Any claim added by reissue takes effect as to recovery of damages for infringement only from the date of said reissue.

Patent Suits.—The U.S. courts alone have jurisdiction of suits for infringement of letters patent, but State courts may adjudicate questions of validity and infringement which arise collaterally in suits of which they otherwise have jurisdiction. The U.S. courts do not have jurisdiction of suits based on assignments of, or licences under, patents unless the parties are citizens of different States. The remedies for infringement include an injunction against continuance thereof, and a recovery of the damages the plaintiff has suffered, or of the profits the infringer has realized, from the making, using or selling of the patented thing or process. The Government may be sued for infringement in the U.S. Court of Claims and reasonable compensation therefor recovered. The Government may not be enjoined from continuing the infringing use or manufacture. Patents can be annulled for fraud perpetrated in obtaining them only by suit instituted by the U.S. attorney general.

Marking Patented Articles.—If a patented article, or the package in which it is sold is not marked "Patent" with the number of the patent, or "Patented" with the patent date if granted prior to April 1, 1927, no damages can be recovered for infringements committed prior to actual notice of infringement given by the patent owner to the infringer. False marking with the word "patent * * or any word of like import" renders the offender liable to a fine of $100 for each offence.

INTERNATIONAL PATENTS

The International Convention for the protection of industrial property, covering patent rights, was signed at Paris on March 20, 1883; the necessary ratifications were exchanged on June 6, 1884, and the Convention came into force a month later. The Convention has since been revised at Brussels on Dec. 14, 1900, at Washington on June 2, 1911, and at The Hague on Nov. 6, 1925. The principal points of the Convention in respect of patents are the right of priority given to an applicant in one

country of the Union during the period of 12 months for making applications in other countries of the Union, and the provision giving a period of three years from application within which revocation for non-working is not to be made. Article 5, in its present form, provides that the importation by the patentee into the country where the patent has been granted of articles manufactured in any of the countries of the Union shall not entail revocation of the patent. Nevertheless each of the contracting countries shall have the right to take the necessary legislative measures to prevent the abuses which might result from the exercise of the exclusive rights conferred by the patent, for example, failure to work. These measures shall not provide for the revocation of the patent unless the grant of compulsory licences is insufficient to prevent such abuses. In no case shall the patent be liable to such measures before the expiration of at least three years from the date of the grant of the patent, and then only if the patentee is unable to justify himself by legitimate reasons. Provision was made by ss. 103 and 104 of the Patents Act 1883 for carrying out the Convention in Great Britain by Orders in Council, applying it from time to time to (a) British possessions whose legislatures had made satisfactory arrangements for the protection of inventions patented in Great Britain; (b) foreign States with which the sovereign had made arrangements for the mutual protection of inventions. The Act of 1907 contains similar provisions (s. 91, as amended by the Act of 1919). The Patents and Designs (Convention) Act, 1928, was passed to give effect to the revised Convention of 1925. In addition to Great Britain, Australia, Canada, Ceylon, New Zealand, Trinidad and Tobago, the following are now parties to the International Convention: Austria, Belgium, Brazil, Bulgaria, Cuba, Czechoslovakia, Danzig, Dominican Republic, Denmark, Esthonia, Finland, France, Germany, Greece, Hungary, Irish Free State, Italy, Japan, Yugoslavia, Latvia, Luxembourg, Mexico, Morocco (part under French protection), Netherlands and Dutch East Indies, Norway, Poland, Portugal (with Azores and Madeira), Spain, Sweden, Switzerland, Syria and Lebanon, Tunis, Turkey and the United States.

An international bureau in connection with the Convention is established at Berne, where an official monthly periodical, *La Propriété industrielle,* is published. (F. G. U.)

Other Countries.—For full information on this subject see *Patent Laws of the World* (1911–12). *See* also: Belgium, P. van der Haeghen, *Répertoire des droits intellectuels en Belgique* (1924); Brazil, G. PATER, WALTER HORATIO (1839–1894), English man of letters, was born at Shadwell on Aug. 4, 1839. He was the second son of Richard Glode Pater, a medical man, of Dutch extraction, born in New York. After Richard Pater's death the family moved to Enfield, where the children were brought up. Walter Pater was educated at King's School, Canterbury, and at Queen's College, Oxford. After taking his degree he settled in Oxford and read with private pupils. In 1864 he was elected to a fellowship at Brasenose. Pater now began to write for the reviews, his early papers including one on Coleridge in the *Westminster Review* (1866), and another (1867) on Winckelmann. In the following year his study of "Aesthetic Poetry" appeared in the *Fortnightly Review,* to be succeeded by essays on Leonardo da Vinci, Sandro Botticelli, Pico della Mirandola and Michelangelo. These, with other studies of the same kind, were in 1878 collected in his *Studies in the History of the Renaissance.*

Pater was now the centre of a small circle in Oxford. The little body of Pre-Raphaelites were among his friends, and by the time that *Marius the Epicurean* appeared he had quite a following of disciples to hail it as a gospel. This fine and polished work, the chief of all his contributions to literature, was published early in 1885. In it Pater displays, with perfected fullness and loving elaboration, his ideal of the aesthetic life, his cult of beauty as opposed to bare asceticism, and his theory of the stimulating effect of the pursuit of beauty as an ideal of its own. In 1887 he published *Imaginary Portraits,* a series of essays in philosophic fiction; in 1889, *Appreciations, with an Essay on Style;* in 1893, *Plato and Platonism;* and in 1894, *The Child in the House.* His *Greek Studies* and his *Miscellaneous Studies* were collected posthumously in 1895; his posthumous romance of *Gaston de Latour* in 1896; and his *Essays from the "Guardian"* were privately printed in 1897. A collected edition of Pater's works was issued in 1901.

Pater changed his residence from time to time, living sometimes at Kensington and in different parts of Oxford; but the centre of his work and influence was always his rooms at Brasenose. He wrote with difficulty, correcting and recorrecting with imperturbable assiduity. His mind, moreover, returned to the religious fervour of his youth, and those who knew him best believed that had he lived longer he would have resumed his boyish intention of taking holy orders. He was cut off, however, in the prime of his powers. He died on July 30, 1894.

Pater's nature was so contemplative, and in a way so centred upon reflection, that he never perhaps gave full utterance to his individuality. His peculiar literary style, too, burnished like the surface of hard metal, was too austerely magnificent to be always persuasive. At the time of his death Pater exercised a remarkable and a growing influence among that necessarily restricted class of persons who have themselves something of his own love for beauty and the beautiful phrase. But the cumulative richness and sonorous depth of his language harmonized intimately with his deep and earnest philosophy of life; and those who can sympathize with a nervous idealism will always find inspiration in his sincere and sustained desire to "burn with a hard, gem-like flame," and to live in harmony with the highest. (A. WA.)

Mr. Ferris Greenslet's *Walter Pater* (in the "Contemporary Men of Letters" series, 1904) is an interesting piece of criticism. Mr. Arthur Benson's study in the "English Men of Letters" series (1906), is admirable. *See* too a sketch in Edmund Gosse's *Critical Kit-Kats;* and an estimate from a Roman Catholic standpoint in Dr. William Barry's *Heralds of Revolt,* where Pater is compared with J. Addington Symonds. T. Wright's *Life of Walter Pater* (1907) is an elaborate but unsatisfactory piece of work. *See* E. Thomas, *Walter Pater: A critical study* (1913); also C. A. Stonehill, *Bibliography of Modern Authors.*

PATERNÒ, a town of Sicily, in the province of Catania, 11 m. W.N.W. of Catania by rail, at the foot of Mt. Etna. Pop. (1921) 33,334 (town), 33,914 (commune). There is a well-preserved 14th century castle.

PATERSON, WILLIAM (1658–1719), British writer on finance, founder of the Bank of England and projector of the Darien scheme, was born in April 1658, at Tinwald, Dumfriesshire. A desire to escape the religious persecution then raging in Scotland, led him southward, and after settling for some time in Bristol, he travelled to America where he lived chiefly in the Bahamas. It was here he formed the vast design known as the Darien scheme. On his return to England he was unable to induce the Government of James II. to engage in his plan. He went to the Continent and pressed it to no purpose in Hamburg, Amsterdam and Berlin, and on his return to London he engaged in trade and rapidly amassed a considerable fortune. About 1690 he was occupied in the formation of the Hampstead Water company, and in 1694 he founded the Bank of England. The Government required money, and the country, rapidly increasing in wealth, required a bank. The subscribers lent their money to the nation, and this debt became the bank stock. The credit of having formulated the scheme and persuaded its adoption is due to Paterson. He was one of the original directors, but in less than a year he fell out with his colleagues, and withdrew from the management. He had already propounded a new plan for an orphan bank (so called because the debt due to the city orphans by the corporation of London was to form the stock). But the subscribers to the Bank of England feared a rival to their own undertaking.

Paterson then went to Edinburgh, where he propounded the Darien (*q.v.*) scheme to his countrymen who were desirous of sharing in England's foreign trade. He is the supposed author of the Act of 1695 which formed the "Company of Scotland trading to Africa and the Indies." This company, he arranged, should

establish a settlement on the Isthmus of Darien, and "thus hold the key of the commerce of the world." There was to be free trade, the ships of all nations were to find shelter in this harbour not yet erected, differences of race or religion were neglected; but a small tribute was to be paid to the company, and this and other advantages would so act that Scotland would become one of the richest of nations.

On July 26, 1698, the first ships of the expedition set sail "amidst the tears and prayers and praises of relatives and friends and countrymen." Some financial transactions in which Paterson was concerned, and in which, though he had acted with perfect honesty, the company had lost, prevented his nomination to a post of importance. He accompanied the expedition as a private individual, and was obliged to look on whilst his "golden dream" faded away before his eyes. His wife and child died, and he was seized with a dangerous illness. It was noted that "he hath been so mightily concerned in this sad disaster, so that he looks now more like a skeleton than a man." Still weak and helpless, and yet protesting to the last against the abandonment of Darien, he was carried on board ship, and, after a stormy voyage, he and the remnant of the ill-fated band reached home in Dec. 1699.

In his native air Paterson quickly recovered his strength, and his fertile mind was soon at work on new schemes. He prepared an elaborate plan for developing Scottish resources by means of a council of trade, and tried to induce King William to enter on a new Darien expedition. In 1701 he removed to London, and here by conferences with statesmen, by writing, and by personal persuasion helped on the union. He was much employed in settling the financial relations of the two countries. One of the last acts of the Scots parliament was to recommend him to the consideration of Queen Anne. The United Parliament, to which be was returned as a member for the Dumfries burghs, though he never took his seat, decided that his claim should be settled, but it was not till 1715 that an indemnity of £18,241 was ordered to be paid him. His last years were spent in Queen square, Westminster, but he removed from there shortly before his death on Jan. 22, 1719.

As many as 22 works, all of them anonymous, are attributed to Paterson. These are classified by Bannister under six heads, as dealing with (1) finance, (2) legislative union, (3) colonial enterprise, (4) trade, (5) administration, (6) various social and political questions. Of these the following deserve special notice: (1) *Proposals and Reasons for constituting a Council of Trade* (1701). This was a plan to develop the resources of Scotland through the agency of a council, which, with the revenues derived from duties on sales, lawsuits, successions, etc., was to foster trade, revive the Darien scheme, relieve the poor, and regulate the currency. (2) *A Proposal to plant a Colony in Darien to protect the Indians against Spain, and to open the Trade of South America to all Nations* (1701). This details the advantages to be derived by Great Britain from the Darien scheme. (3) *Wednesday Club Dialogues upon the Union* (1706). These were imaginary conversations in a club in London about the union with Scotland. Paterson's opinions were put into the mouth of a speaker called May, who sets forward the terms which would make the union acceptable to Scotsmen. (4) Along with this another discussion of the same imaginary body, *An Inquiry into the State of the Union of Great Britain and the Trade thereof* (1717), may be taken. This was a consideration of the union and a discussion as to the best means of paying off the national debt—a subject which occupied a great deal of Paterson's attention during the later years of his life.

Paterson's plans were vast and magnificent, but he was no mere dreamer. Each design was worked out in minute detail, each was possible and practical. The Bank of England was a stupendous success. The Darien expedition failed from hostile attacks and bad arrangements. But the original design was that the English and Dutch should be partakers in it, and, if this had occurred, and the arrangements, against many of which Paterson in letter after letter in vain protested, had not been as they were, Darien might have been to Britain another India. Paterson was a zealous free-trader long before Adam Smith, and his remarks on finance and his argument against an inconvertible paper-currency, though then novel, now hold a place of economic orthodoxy. Paterson's works are excellent in form and matter; and few men who have written so much have said so little about themselves.

See S. Bannister, *Life of W. Paterson* (1858); Paterson's *Works*, by S. Bannister (3 vols., 1859); W. Pagan, *The Birthplace and Parentage of W. Paterson* (1865); *Eng. Hist. Review*, xi. 260. The brilliant account of the Darien scheme in the fifth volume of Macaulay's *History* is incorrect and misleading; that in Burton's *Hist. of Scotland* (vol. viii. ch. 84) is much truer. Consult also the memoir in Paul Coq, *La Monnaie de banque* (1863), and J. S. Barbour, *A History of William Paterson and the Darien Company* (1907). For a list of fugitive writings on Paterson *see* Poole's *Index of Periodicals*. (F. Wt.; X.)

PATERSON, a city of north-eastern New Jersey, U.S.A., the county seat of Passaic county; on the Passaic river, 13 m. N. of Newark and 17 m. N.W. of New York city. It is served by the Erie, the Lackawanna and the New York, Susquehanna and Western railways, interurban trolleys, motor-bus and truck lines. Pop. (1920) 135,875 (33% foreign-born white, including 11,566 from Italy and 10,503 from Poland, Russia and Lithuania); 1928 estimate, 144,900. It occupies a restricted area of 8·36 sq.m., surrounded by the city of Clifton on the south (pop. in 1920: 26,470); the boroughs of West Paterson (pop. 1,858), Totowa (1,864), Haledon (3,435), Prospect Park (4,292) and Hawthorne (5,135) on the west and north; and the township of Saddle River (2,845) and the borough of East Paterson (2,441) across the river on the north-east and the east. Within 10 m. of Paterson's city hall there is a population of about 600,000.

The river winds around and through the city in a series of curves. It has a descent here of about 70 ft., of which 50 ft. is in one perpendicular fall, and furnishes power for many of the manufacturing plants, formerly by a system of raceways and water-wheels, now through a hydro-electric plant. Three parks and two cemeteries border on the river. Since 1910 several old cemeteries in the heart of the city have been converted into parks or used for schools and business buildings. The city has a city-plan commission and a zoning commission. The assessed valuation for 1927 was $200,464,419.

Paterson has a unique form of government. The mayor, elected by the people every two years, appoints bi-partisan commissions (on finance, public works, fire and police, parks, education and health) which are responsible for the administration of their respective departments. The board of finance is the appropriating body, but it spends no funds, except for its own expenses. The water-supply from the Passaic river (furnished by a private company) will be replaced about 1930 by a share in the supply from the Wanaque watershed, under development by joint action of several municipalities. The city's sewage empties into the great Passaic valley drain (another joint undertaking, completed in 1927) which carries the sewage of 15 municipalities along the Passaic river from Paterson to Newark out to Robins reef in New York bay. Paterson has a low general death rate, and an exceptionally low infant mortality for an industrial community. The health department maintains six baby-welfare stations in different parts of the city. The public school plant has been greatly enlarged and modernized since the World War, and many improvements in methods and organization have been brought about on the initiative of the teachers. A normal school established by the city became a State institution in 1925. There is a museum in connection with the public library, and a collegiate centre is maintained with the co-operation of New York university.

Paterson is the principal silk-manufacturing centre of the country and has many other important industries. The aggregate output of the 1,087 establishments within the city limits in 1925 was valued at $200,976,520, of which $110,848,379 represented silk manufactures and $29,041,002 the dyeing and finishing of textiles, largely silk. Other important products are textile machinery and various other kinds, submarine cable, structural steel, boilers, aeroplane motors (including those used by Commander Byrd on his North Pole flight and by Lindbergh on his flight from New York to Paris), thread and men's shirts. The silk industry employs some 30,000 persons in Paterson and the

immediate suburbs. Every process is carried on except the reeling of the raw silk from the cocoon. Raw silk is received in skeins from Japan and China, Asia Minor, Italy and France and is made into every variety of broad and narrow silk, dyed, finished and ready for the market, before it leaves the city. About 20% of all the broad silk produced in the United States is made in Paterson (in plant units ranging from 10 to 750 looms) and 75% of all the silk that comes into the country is dyed here. It is estimated that there is constantly in transit through the streets, on any working day of the year, about $1,000,000 worth of silk, at all the various stages of manufacture.

Paterson had its origin in the incorporation on Nov. 22, 1791, of the Society for Establishing Useful Manufactures (the "S.U.M."), which was planned and organized by Alexander Hamilton, with a view to making the United States industrially independent. The Great falls of the Passaic river were selected by the society as a favourable situation for its enterprise, and here a town was established in 1792. It was named in honour of William Paterson, then governor of New Jersey, was incorporated as a township in 1831 and chartered as a city in 1851. The S.U.M. soon dropped its manufacturing operations, but continued to develop its real estate and water-power interests. It still exists (1929) and controls certain water rights. Cotton manufacturing was the first industry established. The first cotton yarn was spun in 1793 in a mill run by ox-power, and the next year, on completion of the dams and reservoir, a cotton factory began operations. Attempts to manufacture machinery were made as early as 1800. The first locomotive (the "Sandusky") was built in 1837, and by 1860 Paterson was supplying locomotives to all parts of the United States and to Mexico and South America. The first silk mill was established in 1839 by John Ryle and George Murray, who had been trained in the industry in England. From this time there was a steady development of silk-manufacturing, until in the '70s Paterson was using two-thirds of all the raw silk imported into the country. Paterson is closely linked with the development of transportation facilities by land, under water and in the air: a Rogers locomotive was the first to cross the great North-west; the submarine was invented here by John P. Holland, and the manufacture of aeroplane motors is now a leading industry. The population of the city was 19,586 in 1860, 51,031 in 1880 and 105,171 in 1900. Between 1900 and 1920 it increased 29%.

PATHĀN, the name applied in India to the Afghāns, though Rohilla (*q.v*, *Rohela,* "hillman") is a synonym. The early history of this highly composite race is obscure. Farishta imagined they were Copts. He may have meant Guptas, but his history is unconvincing. It is difficult to trace any clear mention of them before A.D. 1000 and then they seem to have been obscure mountaineers of the hills about Ghazni. The derivation of the name is obscure.

The name Afghān is in literature much older than Pathān (unknown to writers earlier than the 16th century), though it can hardly be a Pushtu word as that speech has no *f*, but it was not until the 18th century that the Afghāns established their independence and founded Afghānistān as a state.

The land of the Pathāns is bounded on the south by the country of the Baloch (*see* Baluchistān), extending northwards from the southern boundary of Dera Ismail Khān district up to and including Dīr, Swāt and Bajaur on the left bank of the Kābul. In these Khānates the name Pathān, however, no longer connotes Pathān by race, as it is applied only to a share-holder in tribal land, opposed to Fakīr (*q.v.*), a landless man, and loss of his land reduces a man to that status. Westwards the Pathān country projects into Afghānistān, and eastwards to and across the Indus, while Pathān colonies, often military as in Rohilkhand, old Afghān garrisons, fiefs, dynasties and settlements, are found all over northern India and even in the south. The true Afghānistān is indeed defined as extending from the Kashi-ghar or Shawal, the Afghān name for the Takht-i-Sulaimān, "Sulaimān's throne," the traditional cradle of the race, a lofty peak of the Koh-i-Syāh, "Dark Mt." to the border of Kandahār. On this throne is a place of pilgrimage. The Sulaimān range covering an area of fully 1,600m. from north to south and about 200m. from west to east may however be regarded as the earliest seat of the Afghāns. But the Pathāns do not admit that they originated in this area.

On their conversion to Islam, which belief must have been accepted by most of them at an early period, they discovered that they were of far more exalted ancestries, varied according to tribal caprice. Thus the Orakzai here claim Persian descent, but in the 16th century, a daring genealogist compiled an Afghān thesaurus for an Afghān patron and made all Afghāns descendants of Afghana, son of Jeremiah, son of Malik Saul, Solomon's commander-in-chief. The Pathāns comprise many tribes such as the Afrīdis, Orakzais, Mohmands (*qq.v.*), and in the Pathān area dwell such tribes as the Turis (*q.v.*), and the Dilazāks, not of Pathān origin. A termination—*zai* (Pers.—*zāda,* Pash, *zoe* "Son") —is a patronymic, which clan as well as tribe names have. The sept or family is styled *khel,* a word used widely in India and probably not borrowed from the Arabic *kheyl.*

PATHOLOGY, the branch of medical science which deals with the causes of disease, the anatomical, physiological and functional changes which these causes induce and the methods whereby the body combats both causes and changes. Used alone, the term refers to man and animals; for vegetable pathology or phytopathology, *see* PLANTS: *Pathology.*

The study of pathology began about 100 years ago and it was in the last 30 years of the 19th century that its importance began to be recognized by definite and separate academic provision for its prosecution. At first it consisted mainly in investigation of the changes found in the human body after death and their correlation with the signs of disease which had been observed during life. The large progress made along these lines soon led to its expansion in a variety of directions until pathology came to include almost anything which had to do with disease, and its field included aetiology, pathogenesis, morbid anatomy, microscopic histology, parasitology, functional changes, chemical alterations, and indeed any topic, except diagnosis and treatment, which was open to fairly accurate study. The contemporary progress of medicine and surgery showed also that laboratory methods for the investigation of sick persons afforded valuable aids in diagnosis; this large subject of "clinical pathology" is properly recognized as belonging to clinical medicine rather than to pathology. This very diverse assemblage of studies forms together a consistent whole, but the increase of knowledge in some directions has been so great that bacteriology, immunology, protozoology, pathological chemistry and other branches have been progressively separated as specialized topics. (*See* BACTERIA AND DISEASE; IMMUNITY; PARASITIC DISEASES, etc.) In the residuum, apart from a tendency to assimilate pathology to the other biological sciences and a considerable increase in the attention paid to functional as distinct from anatomical changes, no ideas or methods of primary importance have emerged in late years to cause any great change in general outlook, and workers have mostly been engaged on the elaboration and consolidation of the science. Pathology in this restricted sense may be taken to mean the study of the reactions of living organisms to injury.

Nature of Injuries.—The injury may be of very various kinds: mechanical trauma, injury by poisonous substances (many of the most important of which are produced by parasites), defective supply of food (*e.g.,* by living at high altitudes or by errors of diet), electricity, radiation energy and other factors which are still indefinite. The injury may immediately cause gross alterations in structure, and it is known that the physical injury of a cell often entails radical changes in the biological and chemical characters of its protoplasm which depend in some way on its architecture as a whole. Or the injury may be anatomically perceptible though unaccompanied by any large structural changes. Or it may, like electric shocks, cause no visible change and yet lead to a complete and permanent cessation of the activities which constitute what we know as life. Or, finally, it may cause no anatomical changes recognizable by present methods and be put in evidence only by greater or smaller alterations in function.

The obvious anatomical changes in injured tissues with which the early students of pathology mostly concerned themselves are

not as a rule the direct and immediate consequence of the injury. They result partly from alterations which take place in cells after death by the process known as *autolysis* and partly from the activity of the uninjured and healthy cells in the neighbourhood and elsewhere in the body which constitutes the response or *reaction.*

Autolysis.—This is the mechanism by which dead tissues tend to be automatically removed. The normal body consists of live cells and certain products of live cells (such as bone) which are not wholly dead in that they are in functional relation to living tissues. Any dead cells are therefore abnormal or foreign elements and must be removed if restoration of the normal structure is to be achieved. When cells die, ferments are set free which act on the substance of the cell much in the same way as the digestive juices act on food in the alimentary canal. The solids are liquefied and so readily absorbed into the circulating blood, carried away to other parts of the body and if necessary, excreted. Autolysis is naturally signalized by substantial structural changes recognizable by the naked eye or by the microscope. The translucency, colour and consistency of the part are altered, and it is on the recognition of these secondary changes that morbid anatomists depend. Under the microscope the nuclear membrane and chromatin, the protoplasm and the cell wall become more and more disorganized until nothing remains except amorphous débris.

The *reaction* by the uninjured parts of the body is the means by which the effect of the injurious agent is diminished and the normal constitution of the injured part restored as far as may be possible. It may be local or general. Many of the symptoms and signs of disease are due to it rather than to the injury which is the beginning of the disease.

Cellular Processes.—In the higher animals, cells which are mechanically injured or have suffered gross structural change seem as a rule to be incapable of recovery: nerve cells may have their long processes cut off and be able to repair the damage, but such facility is quite exceptional. It is more frequent in lower forms of life but here, too, in unicellular animals such as bacteria any substantial injury is usually irrecoverable and is made good not by the restoration of the individual but by a compensatory increase of the other members of the community of which the injured cell formed a part. Similarly in man, when a part is injured, the whole of the body is available and may be used in co-operation to bring the part, and with it the whole, back to normality. This reaction, whatever its real nature, has the appearance of being purposive in the sense that it is adapted to achieve a definite end.

Pathological changes indeed illustrate exquisitely two great biological truths. The first is that it is characteristic of all live organisms to resist any alterations in their structure and composition and, if these are varied by circumstances which are beyond control, to proceed actively to correct the deviation and so return to the normal state. The second is that all the parts of which the organism is composed work together and in relationship to one another for the common good. A growing realization of these principles has been one of the most productive changes in recent pathological thought. It carries the corollary that the anatomical changes, which are generally the first objects of study, must be regarded as representing phases of processes rather than definitive states. The mode of thought which has collected into museums specimens of morbid anatomy and classified them as if they were species of animals should be replaced by one which regards a hypertrophied heart, a cirrhotic liver, or a sclerosed kidney, not as a "typical" example of a state, but as an illustration of one stage in a process by which the body has responded to a stimulus of injury.

Mechanism of Reaction.—The general nature of the reaction being purposive and restorative, it is likely that the particulars of the mechanism by which it is brought about will vary widely, since the constants of live organisms are the ends which are achieved rather than the means by which they are reached. Such is the case as will be seen from some illustrative examples.

The human economy is adjusted to live in air at a pressure of about 760 mm. of mercury containing 21% of oxygen: a compromise of the conflict between having a blood of a tolerable viscosity for the heart to pump round the body and one which will carry an adequate amount of oxygen from the lungs to the tissues has been found at a concentration of about 5,000,000 red corpuscles per cubic millimeter; and the respiratory centre is adjusted to respond to a pressure of carbon dioxide which corresponds to about 40 mm. of mercury in the alveolar air. If man goes to an altitude of 15,000 ft. above sea-level, where the barometric pressure is only some 440 mm. of mercury and the oxygen pressure correspondingly reduced, he is at once in difficulties in respect to the supply of oxygen, especially if the need for it is increased by activity. No clear injury is inflicted on the tissues of the body which can be recognized by anatomical changes, but the shortage of oxygen causes plain symptoms and initiates a response the effect of which is to correct the deficiency wholly or in part. This is done by altering the sensitivity of the respiratory centre so that it responds to a lower pressure of carbon dioxide and so increasing the amount of air breathed, by changing the composition of the blood so that the haemoglobin will take up more than the normal amount of oxygen at a given oxygen pressure and by stimulating the bone marrow to grow and produce more red corpuscles so that the concentration of haemoglobin in the blood and hence its oxygen-carrying power are increased. The connecting links between the deficiency of oxygen and this complex reaction (*i.e.,* the immediate stimuli to which the reactions are responses) are not known. The result is that man can soon live comfortably under conditions so different from those to which he is accustomed that they would cause serious harm if not compensated.

Simple Wounds.—A simple incised *wound* of the skin and superficial tissues made by a knife which is chemically and bacteriologically clean inflicts an uncomplicated mechanical injury on a limited number of cells in the epidermis and dermis. This is followed after a few hours by a familiar reaction: the injured part feels full and uncomfortable and is swollen, red and painful. These are the outward signs of an inflammatory reaction, which consists intimately in a dilatation of the blood vessels, an increased flow of blood to the neighbourhood and an alteration in the walls of the capillary vessels which enables liquid plasma and leucocytes to pass through from the blood to the tissue spaces. The cells killed by the injury undergo autolysis and in the course of a few days they are replaced by fresh cells derived from the adjacent epithelial cells of the skin and from the connective tissue of the dermis, as is appropriate.

The result in the end is that the wound is healed and the part restored to normal. It is impossible to suppose that this reaction is started by the absence of the cells which were originally destroyed: the actual stimulus is no doubt provided by the soluble products of their autolysis, which can be shown outside the body to have a stimulating action on cell-growth and by suitable experiments to alter the permeability of capillary vessels. The process is self-regulated and the inflammatory reaction is accessory to the restorative growth. By increasing the local circulation it raises the temperature of the part and so promotes all cellular activities; it provides plasma, which helps to wash away the soluble remains of the dead cells, and leucocytes, which eat the more resistant remnants of the cells; the discomfort which attends the hyperaemia and swelling is of value in securing rest to the injured part and freedom from further mechanical disturbance, conditions which help cell-growth and healing. The process is also automatically regulated quantitatively for the amount of autolysate, *i.e.,* the amount of stimulus, depends on the extent of the original injury. Its effect varies with the responsivity of different tissues and, allowing for that, is determined by its concentration. If this is very high, which occurs in the ordinary way only with exceptionally massive destruction of tissue, it injures and kills cells and is responsible for the fatal condition known as secondary shock which may follow extensive injuries. Lower concentrations stimulate growth, as often happens with cellular poisons. And if the products of autolysis are present only in concentrations below the threshold value for stimulation, they have no action on the tissues. Hence in the example under consideration the response is limited to the immediate neighbourhood of the

injury and the growth of cells takes place where it is needed and not in all the parts of the body to which traces of autolysate are carried in the blood. The local reaction to a bullet or a piece of glass buried in the tissues illustrates the same regulative reaction. The response consists in a growth of the connective tissue next to the foreign body without any obvious destruction of cells, due to the irritants nowhere reaching an actually poisonous concentration owing to their small solubility in the tissue fluids.

Abscesses.—The history of an *abscess* illustrates a similar kind of injury stimulus and response, complicated by the fact that the infliction of the injury is itself a process rather than an event. Abscesses can be produced experimentally by unorganized irritants, but in the natural course they are caused by bacteria which are capable of multiplication and produce poisonous substances which are effective agents in killing and injuring cells, and as stimuli have, in a general way and apart from special actions, the same effect as the products of autolysis. At first the organisms are present only in small numbers and do relatively little damage, but as they increase in numbers the amount and concentration of their poisons increase in parallel until a substantial piece of tissue is destroyed. This undergoes autolysis and the stimulus of the autolysate is added to that of the bacterial toxins. (*See* Inflammation and Its Sequels.)

That specially sensitive cells may, however, be injured is shown by the fever and feeling of illness which an abscess may cause and by the functional impairment of the secretory cells of the kidney and stomach and other delicate tissues. We also find evidence of the reception of stimuli in distant parts of the body in the growth of leucocytes in the bone-marrow. Any good-sized abscess contains in its pus more leucocytes than are present at any one time in the circulating blood, from which it follows that the formation of an abscess leads to the production of fresh leucocytes and that the cells which develop into leucocytes must be exceptionally responsive to the small amounts of stimulating substances which reach them. This deduction is confirmed by direct examination of the bone-marrow where leucocytopoiesis is found going on actively, often with a vigour which results in there being an obvious excess of these cells in the circulating blood. The purposive and reparative nature of this reaction needs no further elaboration beyond indicating that the passage of plasma out of the inflamed vessels brings antibodies (*see* Immunity) to bear on the bacteria to which the leucocytes are also directly inimical and that the general, as contrasted with the local, rise of temperature promotes the multiplication of leucocytes at places distant from the abscess itself. The reaction does not always succeed: the bacteria may generate such a concentration of poisons throughout the body as is fatal to essential organs such as the brain and heart. On the other hand, an abscess may cure itself by destroying so much tissue that the pus finds an exit to the surface of the body and the absorption of poisons ceases because it becomes mechanically easier for them to pass outwards with the stream of plasma than inwards, a process of natural cure imitated and anticipated by surgical interference. The same result is gained if the bacteria die out or are killed off.

Hypertrophy (*q.v.*).—If one kidney is removed from a young animal, the other kidney will grow in the course of a few months to twice its normal size. Similarly, if an error of development leads to one kidney being absent from the beginning, the other will be as big as two normal kidneys. In this instance the injury inflicted on the kidney is the presentation of more work to do than it was designed to discharge, and an analogous increase of both kidneys can be brought about by increasing their work by giving excess of water or of nitrogenous food. Muscle and many of the other tissues of the body show the same intimate relation between quantity of substance and quantity of function and will increase their bulk in response to greater functional requirements.

The intermediary mechanism of this *hypertrophy* has not been identified, but the similarity between the products of activity and those of autolysis is suggestive and it may well be that the normal sizes of organs which accompany normal amounts of work are determined by the soluble substances set free in active katabolism. So, too, if functional activity is reduced, the bulk of corresponding tissue becomes smaller. An unused muscle soon wastes, and in consonance with the quietude of old age most of the important organs shrink. If the arm is cut off at the elbow, the muscles which normally move the lower arm wither, the bones to which they are attached grow smaller, and the nerve cells in the spinal cord which actuate them may disappear.

Two points need further mention: (1) The removal of one kidney has no detectable ill-effect on an animal or man; one kidney is evidently enough to do the ordinary excretory work which is required. But the kidneys and other organs are designed to discharge, and are capable of discharging, much more than the ordinary amount of function; a muscle can at any moment do more than its average work and indeed more than it has ever been called upon to do before. The possession of this *reserve force* is an obvious teleological necessity for survival, and so precise is the response to an increase of average work that it is maintained in hypertrophied as well as in normal organs. (2) If the increase of work is too large, hypertrophy does not occur, *i.e.*, the stimulus to hypertrophy is an amount of extra function within the range of the reserve force of the organ. This is a well recognized principle in the training of voluntary muscles for athletic or aesthetic purposes.

All these circumstances of the response to work seem best to be explained on the hypothesis that an organ is made up of a number of units, each of which requires a restorative period of rest after each of the periods of activity, which are necessary for its maintenance. To fulfil the ordinary amount of function only a proportion of units is active at any one time; as their activity proceeds they become, in accordance with the general law, progressively less excitable by the stimulus which rouses their activity and eventually cease to respond. Their function is then taken over by another set of units which, after a period of rest, are more responsive. In this way a larger number of units is kept in working order than is usually required. The maximum possible work is the amount which can be achieved by all the units working simultaneously: this is the limit of the reserve force, and if it is habitually reached no units have time for the necessary rest and restoration, the organ is worn out and cannot make hypertrophic growth.

These reparative responses are not the inevitable result of the application of the appropriate stimulus: the reaction may not occur if it is unnecessary or undesirable. If the portal vein bringing blood to the left half of the liver is tied, the left lobe progressively atrophies and the right lobe hypertrophies so that at any time the total quantity of liver substance remains about normal. But if the right lobe is injured by tying its bile duct, it does not hypertrophy and the left lobe does not atrophy, though it receives blood only through the hepatic artery. The atrophy is conditioned by the total functional requirements of the body for liver tissue and does not necessarily follow the reduction in blood supply. If rabbit's blood is injected into the circulation of a normal rabbit, the excess of liquid is got rid of in a few hours, and the excess of red corpuscles in ten days or so and the normal position is regained. If such a transfusion is repeated, the excess red cells are destroyed in two or three days and the animal can be brought by practice to a habit of disposing of them promptly. If such a trained animal is bled and then transfused with an equal quantity of blood from another rabbit, no destruction of the injected blood occurs. The difference is that the extra blood is not wanted by the normal animal while the bled animal has need of it to carry oxygen: in the former it is destroyed, in the latter it is kept and used.

Response.—Of the circumstances which facilitate response, age and experience are the most important: their influences will often be antagonistic. The inherent capacity of a tissue to grow and discharge any of its functions steadily diminishes as the organism of which it forms a part grows older. But its available ability to do anything is influenced by whether and how often it has done it before, individually and racially. Experience in such exercises as reproducing blood which has been lost by haemorrhage or making the substances which neutralize bacterial poisons gives the same advantage as it does in the more complicated reactions

of behaviour. In general, the most effective preparation for successful resistance to a large injury is the previous reception of small injuries of the same kind.

Reactions to stimuli may fail in whole or in part because the stimulus is too large and kills the whole organism or because the tissues are old or already diseased. In some instances it is the nature of the tissue which mostly determines the imperfection of the result. Blocking of one of the smaller blood vessels of the heart kills the muscle which the vessel normally supplies. The dead muscle autolyses and is removed, and its place is taken by fibrous tissue instead of by cardiac muscle, which is inherently incapable of the necessary multiplication of cells. The repair is for the time effective but it is unsatisfactory, for fibrous tissue is less elastic than muscle and is liable to tear. The nerve cells of the central nervous system never grow to repair an injury: if some of them are destroyed they cannot be replaced, and the best that can be achieved is a certain amount of functional restoration by the rearrangement and adaptation of the parts which remain. In other cases, the nature of the injury and the mode of its infliction determine the result. The common sclerosis of the kidney begins by the destruction of a proportion of the glomerulotubal units of which the organ is composed by some poison circulating in the blood. The dead tissue is cleared away and, since kidney cells cannot adequately regenerate, the gap is healed by the growth of the connective tissue. Later, which is characteristic of the disease, further destruction takes place and so on from time to time, each loss of secreting tissue being followed by fibrous tissue repair. The other units, as might be expected, hypertrophy, and up to a point function is adequately maintained, partly by the local reaction and partly by a general rise of arterial blood pressure backed by a hypertrophied heart which tends to compensate the diminution of vasomotor mobility and control resulting from the anatomical changes. But if successive injuries continue, the limits of the possible hypertrophy of the remaining healthy tissue are exceeded and its growth is impeded by the firm fibrous tissue which comes to constitute a large part of the organ. Hence, in the end, function fails, as it finally must if repeated injuries are inflicted on tissues which cannot be vicariously replaced and are capable only of compensatory hypertrophy (*i.e.*, most specialized tissues) and not of indefinite regeneration (*e.g.*, connective tissue, blood corpuscles).

These examples are sufficient to illustrate the kind of topics which form the subject-matter of pathological study and the way in which they can at the moment be fruitfully approached. The reaction to injury (using the word in a wide sense even including the new growths or tumours) is a process which is initiated by some definite stimulus arising within or outside the body and generally promoted and extended by secondary stimuli which are produced by the body in the early stages of the response. The injury and the response may be local or general; general injuries may provoke reactions, and local injuries may elicit responses in which many organs take part. The organism in this, as in other respects, has to be regarded as a coherent and essentially indivisible whole, and one must recognize the limitations of the point of view, fruitful enough in the past, from which a live animal appears as an assemblage of relatively independent cells or organs. The character of the response is such that it tends to correct in one way or another the anatomical defect or the functional derangement which is caused by the injury. Whatever the mechanism by which the result is attained, the reaction is purposive in appearance if not in intention, and its purpose is survival.

PATIALA, SIR BHUPINDAR SINGH, Maharaja of (1891–), head of the Sikh community in India, was born Oct. 12, 1891, the son of Maharaja Sir Rajendra Singh, who died in Nov. 1900. On receiving full ruling powers at the close of 1910 he maintained and greatly developed the progressive policy of the council of regency. He actively supported Great Britain during the World War. He promoted the inauguration of the chamber of princes in 1921, and represented the princes at the League of Nations Assembly at Geneva in 1925.

PATIALA or **PUTTIALA,** the premier native state of the Punjab, India, the chief of the three Sikh Phulkian states—Patiala, Nabha and Jind. It consists of three detached blocks of territory, mostly in the plains, though one portion extends into the hills near Simla. Area 5,942 sq.m.; pop. (1921) 1,499,739; estimated revenue, £860,000. Founded by a Sikh chieftain about 1763, it came under British protection, with the other cis-Sutlej states, in 1809. Patiala remained conspicuously loyal to the British during the Mutiny of 1857. The town of Patiala has a station on the N.W. railway. Pop. (1921), 47,531.

PATIENCE or "Solitaire," the name given to certain card-games played by a single person. Although known for centuries, they have seldom been mentioned by writers on playing-cards, and the rules have for the most part been handed down orally. There are two main varieties; in one luck alone prevails, since the player has no choice of play but must follow strict rules; in the other an opportunity is given for the display of skill and judgment, as the player has the choice of several plays at different stages of the game. The usual object is to bring the cards into regular ascending or descending sequences. The starting card is called the "foundation," and the "family" (sequence) is "built" upon it. In other varieties of Patience the object is to make pairs, which are then discarded, the game being brought to a successful conclusion when all the cards have been paired; or to pair cards which will together make certain numbers and then discard as before. There are hundreds of Patience games.

See *Patience Games* by "Cavendish" (1890); *Cyclopaedia of Card and Table Games*, by Professor Hoffmann (1891); *Patience Games*, by Professor Hoffmann (1892); *Games of Patience*, by A. Howard Cady (Spalding's Home Library, New York, 1896); *Dick's Games of Patience*, edited by W. B. and H. B. Dick (New York, 1898); *Games of Patience* (4 series), by Mary E. W. Jones (1898); *Le Livre illustré des patiences*, by "Comtesse de Blanccoeur" (1898); Tarbart's *Games of Patience* in De la Rue's series of handbooks (1905); R. F. Foster, *Hoyle's Games* (1928).

PATINIR, JOACHIM DE (*c.* 1475–1524) Flemish painter, was probably born at Bouvignes about the year 1475. In 1515 he entered the Antwerp painters' gild. He may be called one of the first landscape painters in the Netherlands, for, contrary to the custom of his time, the figures in his pictures are relatively small and are subsidiary to his views. He specialized on landscape. His views are seen from a high standpoint and range over a wide extent of hilly country. The plants of his foregrounds are carefully studied and masses of rich dark foliage and jutting fantastic rocks are placed in the middle distance. The scene is full of incidents, and a religious subject is introduced, because in Patinir's time landscape painting was not yet an art sufficient in itself. The figures are often painted by other artists.

Though few of Patinir's pictures have survived, a large number have been attributed to him. There are but three signed works: "The Flight into Egypt," at Antwerp, "the Baptism of Christ," at Vienna, and the "St. Jerome," at Carlsruhe. Four of his best pictures are at Madrid: "The Flight into Egypt," the "St. Jerome," "Heaven and Hell," and the "Temptation of St. Anthony." In the last named picture the figures are painted by Quentin Matsys. The so-called "Master of the Half-lengths" painted the figures in three of Patinir's landscapes—the "Virgin" at Copenhagen; the "St. John at Patmos," in the National Gallery, London, and the "Magi" at Munich.

Few facts are known about Patinir's life. He was visited by Dürer in 1520 in his house in the Rue Courte l'Hôpital at Antwerp. Patinir died at Antwerp in 1524.

See M. Friedlander, *Von Eyck bis Bruegel* (1921); Sir Martin Conway, *Van Eyck and his Followers* (1921).

PATIO, the Spanish name for an inner court or enclosed space open to the sky. The patio is a common feature in houses in Spain and Spanish America.

PATKUL, JOHANN REINHOLD (1660–1707), Livonian politician and agitator, was born on July 27, 1660, in prison at Stockholm, where his father lay under suspicion of treason. He was a captain in the Swedish army when, in 1689, at the head of a deputation of Livonian gentry, he went to Stockholm to protest against the rigour with which the land-recovery project of Charles XI. was being carried out in his native province. Another petition addressed to the king in the diet in 1692, on behalf of the rights of the Livonian gentry, involved him in a government prosecution. Patkul fled from Stockholm to Switzerland, and was condemned *in contumaciam* to lose his right hand and his estates. For the next four years he led a vagabond life, but in 1698, after vainly petitioning the new king, Charles XII., for pardon, he proceeded to the court of Augustus the Strong, elector of Saxony and king of Poland, at Dresden and bombarded him with proposals for the partition of Sweden. His first plan was a combination against her of Saxony, Denmark and Brandenburg; but, Brandenburg failing him, he was obliged very unwillingly to admit Russia into the partnership. The tsar was to be content with Ingria and Estonia, while Augustus was to take Livonia, nominally as a fief of Poland, but really as an hereditary possession of the Saxon house. Military operations against Sweden's Baltic provinces were to be begun simultaneously by the Saxons and Russians. After thus forging the first link of the partition treaty, Patkul proceeded to Moscow, and, at a secret conference held at Preobrazhenskoye, easily persuaded Peter the Great to accede to the league (Nov. 11, 1699). Throughout the earlier, unluckier days of the Great Northern War, Patkul was the mainstay of the confederates. At Vienna, in 1702, he picked up the Scottish general George Benedict Ogilvie, and enlisted him in Peter's service. In the same year he himself exchanged the Saxon for the Russian service. On Aug. 19, 1704, he succeeded, at last, in bringing about a treaty of alliance between Russia and the Polish republic to strengthen the hands of Augustus, but he failed to bring Prussia also into the anti-Swedish league because of Frederick I.'s fear of Charles and jealousy of Peter. From Berlin Patkul went on to Dresden to conclude an agreement with the imperial commissioners for the transfer of the Russian contingent from the Saxon to the Austrian service. The Saxon ministers, after protesting against the new arrangement, arrested Patkul and shut him up in the fortress of Sonnenstein (Dec. 19, 1705), disregarding the remonstrances of Peter against this violation of international law. After the peace of Altranstädt (Sept. 24, 1707) he was delivered up to Charles, and at Kazimierz in Poland (Oct. 10, 1707) was broken alive on the wheel, as a traitor to Sweden. Charles rejected an appeal for mercy from his sister, the princess Ulrica, on the ground that Patkul, as a traitor, could not be pardoned for example's sake.

See O. Sjögren, *Johan Reinhold Patkul*, (Swed.) (Stockholm, 1882); Anton Buchholtz, *Beiträge zur Lebensgeschichte J. R. Patkuls* (Leipzig, 1893). Patkul's fate provided the material for a tragedy by Gutzkow.

PATMORE, COVENTRY KERSEY DIGHTON (1823–1896), English poet and critic, the eldest son of Peter George Patmore, himself an author, was born at Woodford in Essex, on July 23, 1823. He was privately educated, being his father's intimate and constant companion. His first idea was to be an artist, but after a brief experiment he turned to literature. In 1844 he published *Poems*, a book which was ill-received by the critics. Patmore withdrew and destroyed the remainder of the edition. But the publication of this little volume introduced its author to various men of letters, among whom were Dante Gabriel Rossetti and Holman Hunt, and he was thus drawn into the eddies of the pre-Raphaelite movement, contributing his poem "The Seasons" to the *Germ*. At this time Patmore's father became involved in financial embarrassments; and in 1846 Monckton Milnes secured for the son an assistant-librarianship in the British Museum, a post which he occupied industriously for nineteen years, devoting his spare time to poetry. In 1847 he married Emily Andrews.

In 1853 he republished, in *Tamerton Church Tower*, the more successful pieces from the *Poems* of 1844, adding several new poems which showed distinct advance, both in conception and treatment; and in the following year (1854) appeared the first part of his best known poem, "The Angel in the House," which was continued in "The Espousals" (1856), "Faithful for Ever" (1860), and "The Victories of Love" (1862). In 1862 he lost his wife, after a long and lingering illness, and shortly afterwards joined the Roman Catholic Church. In 1865 he married again, his second wife being Marianne Byles; and a year later purchased an estate in East Grinstead, the history of which may be read in *How I managed my Estate*, published in 1886. In 1877 appeared *The Unknown Eros;* and in the following year *Amelia*, his own favourite among his poems, together with an interesting, though by no means undisputable, essay on *English Metrical Law*. This was followed by *Principle in Art* (1879) and *Religio poetae* (1893). After the death of his second wife in 1880 he married Harriet Robson. In later years he lived at Lymington, where he died on Nov. 26, 1896.

A collected edition of his poems appeared in two volumes in 1886, with a characteristic preface which might serve as the author's epitaph. "I have written little," it runs; "but it is all my best; I have never spoken when I had nothing to say, nor spared time or labour to make my words true. I have respected posterity; and should there be a posterity which cares for letters, I dare to hope that it will respect me." His best work is found in the volume of odes called *The Unknown Eros*, which is full not only of passages but of entire poems in which exalted thought is expressed in poetry of the richest and most dignified melody.

(A. Wa.)

The standard life of Patmore is the *Memoirs and Correspondence* (1901), edited by Basil Champneys. *See* also E. W. Gosse, *Coventry Patmore* (1905, "Literary Lives" series), and an essay by Mrs. Meynell prefixed to the selection (1905) in the "Muses' Library."

PATMOS, an island in the group of the Sporades in the Aegean Sea about 28 m. S.S.W. of Samos (37° 20′ N. lat. and 26° 35′ E. long.; length from north to south, about 10 m., greatest breadth 6 m.). The island is volcanic, bare and rocky throughout; rising to about 800 ft. with deeply indented coast. The harbour of Scala opening eastward divides the island into two nearly equal portions with a narrow isthmus where stood the ancient town. On the hill above are massive remains of the citadel. The modern town stands on a ridge in the southern half. A steep paved road leads in about twenty minutes from the port of Scala to the monastery of St. John, crowning the hill with towers and battlements, a fortress rather than a monastery. Of the 600 mss. once in its library only 240 are left. The houses of the town are better built than those of neighbouring islands, but the streets are narrow and winding. Pop. *c.* 4,200. The port of Scala contains about 140 houses, besides some old well-built magazines and some potteries. Scattered over the island are about 300 chapels.

Patmos is rarely mentioned in antiquity. Ionians settled there at an early date. As a remote islet it was the place of banishment of St. John the Evangelist, under Domitian in A.D. 95. He was released about eighteen months afterwards under Nerva. Here he is said to have written the Apocalypse. To the left of the road from Scala to the town, about half-way up the hill, a grotto is still shown (τὸ σπήλαιον τῆς Ἀποκαλύψεως) in which the apostle is said to have received the heavenly vision. It is reached through a small chapel dedicated to St. Anne. The *Acts of St. John*, attributed to Prochorus, narrates the miracles wrought by the apostle during his stay on the island, but, while describing how the Gospel was revealed to him in Patmos, it does not mention the Apocalypse. During the dark ages Patmos seems to have been entirely deserted, probably on account of the pirates. In 1088 the emperor Alexis Comnenus, by a golden bull, which is still preserved, granted the island to St. Christodulus for the purpose of founding a monastery. This was the origin of the Monastery of St. John, which now owns the greater part of the southern half of Patmos, as well as farms in Crete, Samos and other neighbouring islands. The embalmed body of the founder is in a side chapel of the church. The island was subject to Turkey till it was annexed by Italy in 1912. The population is Greek.

PATNA, one of the Orissa Feudatory States in Behar and Orissa. Pop. (1921) 494,456; area 2,399 sq.m. It lies in the

basin of the Mahanadi river, and is divided by a forest-clad hilly tract into a northern and a southern portion, both of which are undulating and well cultivated. The capital is Bolangir. The state was transferred to Bengal from the Central Provinces in 1905 and was incorporated in Behar and Orissa in 1912.

PATNA, a city, the capital of the province of Behar and Orissa, British India, situated on the right bank of the Ganges. Pop. (1921) 119,976. Patna was selected as the capital of Behar and Orissa on the creation of that province in 1912. A high court was established in 1916 and a university in 1917. The greater part of Patna consists of the city proper, which stretches along the river bank for 9 miles. Its main street is filled by a succession of small shops and houses, broken by public institutions and cultivated fields, with little to suggest the importance of a capital. Its trade is declining and now depends on local products. Its manufactures and industries are also on a small scale; at the census of 1921 there were only 15 concerns with ten or more employees, and their total labour force was only 1,000. West of it lies the civil station of Bankipur, and south-west of the latter the new capital. The new capital is well laid out and spacious: its main roads are 150 ft. wide and a central avenue has a length of nearly a mile and a width of 200 ft. The principal buildings are Government house, the Secretariat, the Council Chambers, the High Court and the Patna museum. The well-known Patna Oriental museum is in the city proper, as also other buildings and institutions mentioned later.

History.—Patna stands on the site of the ancient Pataliputra, the Palibothra of Megasthenes, who was sent there about 302 B.C. as an envoy to Chandragupta by Seleukos Nikator. According to his account, the city had a circuit of 25½ miles and the royal palace was more magnificent than those at Susa and Ecbatana. Under Asoka, Pataliputra was the capital of an empire extending from the Hindu Kush to the Bay of Bengal. The seat of government was moved to Ajodhya by Chandragupta II. towards the close of the 4th century A.D., and Pataliputra, which was a flourishing city in the next century, subsequently fell into ruin; the causes of its fall are obscure, but excavations show the effects of fire and flood. The Chinese pilgrim, Hiuen Tsiang, in the 7th century described it as an old city long deserted, with monasteries and temples in ruins. Patna rose to greatness after A.D. 1541, when Sher Shah made it the capital of Behar. By 1586, when Ralph Fitch visited it, Patna was "a very long and a great town." Under the Moguls it was the seat of the viceroy of Behar and a centre of commerce, which led to factories being established by both the English and Dutch. Its seizure by the English agent, Ellis, in 1763, precipitated war with the nawab of Bengal, Mir Kasim Ali Khan. The recapture of the city by his forces was followed by the ghastly tragedy known as "the massacre of Patna;" under the nawab's orders nearly 200 English prisoners were murdered in cold blood by one of his officers, an Alsatian named Reinhardt, who was known to Indians as Samru. Patna was finally taken by the British forces under Major Knox in 1763. The ancient Pataliputra lies buried deep under the silt of the Ganges, but most interesting remains have been unearthed in the south-west suburbs as the result of excavations in 1892–99 and 1912–16. Among them is the hall of a hundred columns built by the emperor Asoka, the ruins of which have been found to bear a similarity to those of the palace of Darius at Persepolis.

Buildings and University.—The oldest intact building in Patna is a mosque, with a courtyard of glazed tiles, built by Husain Shah, king of Bengal, in A.D. 1499; other noteworthy mosques are Sher Shah's mosque and the stone mosque of Prince Parwez, son of Jahangir (1626). A Sikh temple stands in the place where the great Guru Govind Singh was born in 1675; in it are preserved his cradle, shoes, swords and arrows, as well as a copy of the *Granth* or holy book of the Sikhs, said to have been presented by the guru himself. The old English factory, built early in the 18th century, in which Shah Alam was enthroned as emperor in 1761, is now occupied by the government press. The Gola in Bankipore, a curious brick building, 96 ft. high, of a bee-hive shape, was built in 1786 to serve as a granary for rice in case of famine; it was a typical "folly," for it was never filled.

The University of Patna, founded in 1917, consists of a number of colleges admitted to the degree standard, and of colleges and schools admitted to the intermediate standard. The majority are in Patna, viz., the Patna college, Behar National college, Patna Training college, Patna Law college, Behar National college of engineering, Prince of Wales Medical college and Patna New college. A Senate house was opened in 1926. A scheme of development has been adopted and new buildings, which will include a Science college, are under construction, or proposed.

The DISTRICT OF PATNA has an area of 2,062 sq.m.; pop. (1921) 1,574,287. Throughout the greater part of its extent the district is a level plain; but towards the south the Rajgir hills (*q.v.*) project into it and divide it from the district of Gaya for about 30 miles. The soil is for the most part alluvial, and the country along the bank of the Ganges is peculiarly fertile. The general line of drainage is from west to east; and high ground along the south of the Ganges forces back the rivers flowing from Gaya district. The result is that during the rains a belt of low-lying country four or five miles from its bank is flooded. The chief rivers are the Ganges and the Son. The only other river of any consequence is the Punpun, which is chiefly remarkable for the number of petty irrigation channels which it supplies. So much of the river is thus diverted that only a small portion of its water ever reaches the Ganges. The chief crops are rice, wheat, barley, maize and pulse. The Son canal irrigates 150,000 acres to the north-west; elsewhere irrigation is largely practised from private channels and also from wells.

Apart from Patna city, the district contains many places of historic interest. The Rajgir hills (*q.v.*) are not only associated with the life of Buddha, but contain remains of prehistoric and early historic date. Mahavira, the founder of Jainism, died at Pawapuri, which is consequently a place of Jain pilgrimage. Nalanda (the modern village of Bargaon) was a famous seat of Buddhist learning and culture: it has been called "the Oxford of Buddhist India." Sir A. Cunningham states that he met the finest sculptures of India here; and excavations begun in 1916 have disclosed a maze of *viharas* (monasteries) with seven levels of occupation and buildings of nine different periods. Between the 5th and 12th centuries A.D. the town of Behar was the site of another Buddhist *vihara*, whence its name; it was the capital of South Behar under the Pala kings and then under Mohammedan governors until the 16th century.

The DIVISION OF PATNA comprises the districts of Patna, Gaya and Shahabad, south of the Ganges. Area, 11,149 sq.m.; pop. (1921) 5,544,038. It formerly also included four districts north of the Ganges, viz., Saran, Champaran, Muzaffarpur and Darbhanga, which, in 1908, were formed into the division of Tirhut.

PATON, JOHN LEWIS ALEXANDER (1863–), British educationalist, was born in Sheffield on Aug. 13, 1863, son of the Rev. J. B. Paton, D.D. In Sept. 1903 he was appointed high master of Manchester grammar school and held the post till July 1924. On his retirement a fund was raised in his name to commemorate his services to the town and district, as well as to the school. Paton was a member of the consultative committee of the Board of Education from 1907 to 1915, was lecturer on education in Victoria university and president of the Teachers' Guild (1907) and of the Modern Languages Association (1911). He was a zealous advocate of the social and religious, as well as the literary sides of education.

He published in 1914 a *Life of J. B. Paton*, and his educational works include *Chapters on the Aims and Practice of Teaching* (1896); *The Public Schools from Within* (1906); *The Higher Education of Boys in England* (1906); *Cambridge Essays on Education* (1917); *Vocation* (1919); as well as a special report for the Board of Education on *The Teaching of Classics in Prussian Elementary Schools* (1907).

PATON, SIR JOSEPH NOEL (1821–1901), knighted in 1867, British painter, was born on Dec. 13, 1821, in Woolers Alley, Dunfermline. He began to exhibit at the Royal Academy, London, in 1856. His preference was for allegorical, fairy and religious subjects. He also produced a certain amount of sculpture, more notable for design than for searching execution. He was elected an associate of the Royal Scottish Academy in

1847, and a full member in 1850; and was appointed Queen's Limner for Scotland in 1866. In 1878 the University of Edinburgh conferred upon him the degree of LL.D. He was well known as an antiquary, his hobby being the collection of arms and armour. He died in Edinburgh on Dec. 26, 1901. Among his most famous pictures are "The Pursuit of Pleasure" (1855), "Mors Janua Vitae" (1866), "Oskold and the Ellé-maids" (1874) and "In Die Malo" (1882).

PATRAS (Gr. *Patrai*), the chief seaport on the west coast of Greece, and capital of the province of Achaea and Elis, on a gulf of the same name, 70 m. W.N.W. of Corinth. Pop. *c.* 39,500. It has been rebuilt since the War of Independence, is the seat of a Greek archbishop and an appeal court, and has railway communications with Athens via Corinth and with Kalamata via Pyrgos. It is the port from which the great bulk of currant crop is despatched. The port, formed by a mole and a breakwater, begun in 1880, offers a fair harbour for vessels drawing up to 22 ft. Other exports are sultanas, valonea, tobacco, olive oil, olives in brine, figs, citrons, wine, brandy, cocoons, and lamb, goat, and kid skins. The imports consist chiefly of colonial produce, manufactured goods and sulphate of copper for the vineyards. The castle is a mediaeval structure on the site of the ancient acropolis. The cathedral of St. Andrew is highly popular as the reputed burial-place of the saint.

In Greek legend, Eumelus, taught by Triptolemus how to grow grain, established three townships, Aroe (*i.e.*, ploughland), Antheia (the flowery), and Mesatis (the middle settlement), united by common worship of Artemis Triclaria at her shrine on the river Meilichus. The Achaeans, because the ruling families (*patrai*) lived there, enlarged Aroe, called it Patrae, and recognized it as one of the twelve Achaean cities. In 419 B.C. the town was, by the advice of Alcibiades, connected with its harbour by long walls in imitation of those at Athens. After the defeat of the Achaeans at Scarpheia its whole armed force was destroyed by Metellus, but after Actium, Augustus restored the ancient name Aroe, introduced a military colony of veterans from the 10th and 12th legions and bestowed the rights of coloni on Rhypae, Dyme, and the Locri Ozolae except those of Amphissa. Thus Colonia Augusta Aroe Patrensis became one of the most populous towns of Greece; its colonial coinage extends from Augustus to Gordian III. The scene of the martyrdom of St. Andrew is apocryphal, but, like Corinth, Patras was an early and effective centre of Christianity; its archbishop attended the Council of Sardica in 347. In 551 it was laid in ruins by an earthquake. In 807 it defeated the Avars. Captured in 1205 by William of Champlitte and Villehardouin, the city became the capital and its archbishop the primate of the principality of Achaea. In 1387 De Heredia, grand master of the order of the Hospital at Rhodes, endeavoured to master Achaea and tcok Patras by storm. Later the city was governed by the archbishop in the name of the pope; but in 1428 Constantine, son of John VI., held it for a while. Captured by the Turks, it was surrendered in 1687 to the Venetians, who made it the seat of one of the seven fiscal boards for the Morea. In 1714 it again fell into Turkish hands. It was at Patras that the Greek revolution began in 1821; but the Turks held out till 1828.

PATRICIANS, the members of the old citizen families of ancient Rome (Lat. *patricius*, an adjectival form from *pater*).

I. IN ROMAN HISTORY

Origin of Patricians and Plebeians.—From the earliest period known to us the free population of Rome contains two elements, patricians and plebeians, the former class enjoying all political privileges, the latter unprivileged. The patricians (*patricii*) are members of the clans (*gentes*) which originally formed the citizen body. The plebeians (*plebs*) include all the rest of the free population. The origin of the plebs has been much debated and was in all probability complex. One part was evolved from the "clients," freed men or aliens who attached themselves for reasons of defence and support to the great clans or to their individual members. Very probably also, as a result of an early conquest of Rome, much of the plebs differed in racial origin from its patrician rulers. A third source was the accumulation of aliens drawn to Rome as a centre of traffic between Etruria and Southern Italy. It is significant that many plebeians had acquired wealth, presumably from trade. Many of these aliens would place themselves under the protection of the state or the king rather than that of individual citizens. If the alien came from a town possessing the *ius commercii* with Rome, he would have no need to become the client of a private patron. The whole unprivileged class, whatever its origin, tended to become consolidated. The differences between its various sections were great and their interests often conflicting, *e.g.*, the desires of the trading alien, the favoured client of the patrician and the descendant of the conquered Ligurian must often have been widely separated; compromise was an essential to united action by the three. The constitution attributed to Servius Tullius, which placed military burdens on the shoulders of the plebeians and admitted them to a share, though an inadequate share, in political power, helped to unify the class and prepared the way for the struggle for power which was to occupy the next century and a half, and which resulted in the full attainment by the plebs of the privileges zealously guarded by the patricians.

Reforms of Servius Tullius.—The aim of the reforms associated with the name of Servius Tullius appears to have been the imposition of the duties of citizenship upon the plebeians. This involved an extension of plebeian privilege in two directions. First it was necessary to unify the plebeian order by putting the legal status of the clients on a level with that of the unattached plebeians; and again enrolment in the army involved registration in the tribes and centuries; and as the army soon developed into a legislative assembly meeting in centuries (*comitia centuriata*), the whole citizen body, including plebeians, acquired a small share of political power, which had hitherto belonged solely to the patricians. At the close of the monarchy the plebeian possessed the private rights of citizenship, except for his inability to contract a legal marriage with a patrician, and one of the public rights, that of giving his vote in the assembly. But in liability to the duties of citizenship, military service, and taxation, he was entirely on a level with the patrician. This position was tolerable during the monarchy, when the king served to hold the power of the patrician families in check. But when these families had expelled the Tarquins, the inconsistency between partial privilege and full burdens pressed on the plebeians.

The Struggle of the Orders.—The result was the long struggle for political equality of the two orders (*see* ROME: *History*, "The Republic"). The plebeians in 494 B.C. formed themselves into an exclusive order with annually elected officers (*tribuni plebis*) and an assembly, and by means of this machinery forced themselves by degrees into all the magistracies, and obtained the coveted right of intermarriage with the patricians. Admission to the senate followed, and the political privilege of the two orders was equalized, with the exception of certain disabilities which were attached to the patricians after the victory of the *plebs*. They were excluded from the tribunate and the council of the *plebs*, which had become important instruments of government, and were eligible for one place only in the consulship and censorship, while both were open to plebeians. Since the plebeian element in the state had an immense numerical preponderance over the patrician, these disabilities were not widely spread, and seem generally to have been cheerfully borne as the price of belonging to the families still recognized as the oldest and noblest in Rome. But the adoption of P. Clodius Pulcher into a plebeian family in 59 B.C. with a view to election to the tribunate shows that a rejection of patrician rights (*transitio ad plebem*) was not difficult to effect by any patrician who preferred actual power to the dignity of ancient descent. It was not so easy to recruit the ranks of the patricians. The first authenticated instance of the admission of new members to the patriciate is that of the *lex Cassia* which authorized Caesar as dictator to create fresh patricians. The same procedure was followed by Augustus. The right of creating patricians came to be regarded as inherent in the principate, and was exercised by Claudius and Vespasian without any legal enactment. Patrician rank was regarded as a necessary attribute of the *princeps*, a fact

illustrative of the tenacity with which the Romans clung to the name and form of an institution which had long lost its significance. After the political equalization of the two orders, noble birth no longer constituted a claim to political privilege. Instead of the old hereditary nobility there arose a nobility of office, consisting of all those families, whether patrician or plebeian, which had held curule office. It was the tenure of office that conferred distinction. In the early days of Rome, office was open only to the member of a patrician *gens.* In the principate, patrician rank was held to be a dignity suitable to be conferred on an individual holder of office. But the conferment of the rank upon an individual as distinct from a whole family (*gens*) is enough to show how widely the later conception of patrician rank differed from the ancient.

II. THE LATER PATRICIATE

Under Constantine a new meaning was given to the word patrician. It was used as a personal title of honour conferred for distinguished services. It was a title merely of rank, not of office; its holder ranked next after the emperor and the consul. It naturally happened, however, that the title was generally bestowed upon officials, especially on the chief provincial governors, and even upon barbarian chieftains whose friendship was valuable enough to call forth the imperial benediction. Among the former it appears to have become a sort of *ex officio* title of the Byzantine vice-gerents of Italy, the exarchs of Ravenna; among the barbarian chiefs who were thus dignified were Odoacer, Theodoric, Sigismund of Burgundy, Clovis, and even in later days princes of Bulgaria, the Saracens, and the West Saxons. The dignity was not hereditary and belonged only to individuals; thus a patrician family was merely one whose head enjoyed the rank of *patricius.* With the word were associated such further titles as *eminentia, magnitudo, magnificentia.* Those patricians who were purely honorary were called *honorarii* or *codicillarii;* those who were still in harness were *praesentales.* They were all distinguished by a special dress or uniform and in public drove in a carriage.

In Western Europe.—A further change in the meaning of the name is marked by its conferment on Pippin the Frank by Pope Stephen. The Italian *patricius* of the 6th and 7th centuries had come to be regarded as the *defensor, protector, patronus* of the Church, but the conferring of the title by a pope was entirely unprecedented. It is clear that the patriciate of Pippin was a new office, as the title is henceforward generally *patricius Romanorum,* not *patricius* alone. It was conferred on Charlemagne at his coronation, and borne indiscriminately by subsequent emperors and by a long line of Burgundian rulers and minor princes. On the fall of the Carolingian house the title passed to Alberic II. The emperor Frederick Barbarossa was the last to wear the insignia (in 1167).

PATRICK, ST., the patron saint of Ireland,[1] was probably born about the year 389. He was the son of a deacon, Calpurnius, and the grandson of a presbyter named Potitus. His father was a middle-class landed proprietor and a decurion, who is represented as living at a place called Bannauenta. The only place of this name we know is Daventry, but it seems more probable that Patrick's home is to be sought near the Severn, and Rhys conjectures that one of the three places called Banwen in Glamorganshire may be intended. The British name of the future apostle was Sucat, to which Mod. Welsh *hygad,* "warlike," corresponds. His Roman name has also survived in a Hibernicized form, Cothrige, with the common substitution of Irish *c* for Brythonic *p.* (*Cf.* Irish *casc,* Lat. *pascha.*) Patrick was doubtless educated as a Christian and was imbued with reverence for the Roman Empire. When about sixteen years of age he was carried off by a band of Irish marauders. The latter were possibly taking part in the raid of the Irish king Niall Noigiallach, who met with his end in Britain in 405. Irish tradition represents the future apostle as tending the herds of a chieftain of the name of Miliucc (Milchu), near the mountain called Slemish in county Antrim, but Bury tries to show that the scene of his captivity was Connaught, perhaps in the neighbourhood of Croagh Patrick.

His bondage lasted for six years. During this time he became subject to religious emotion and beheld visions which encouraged him to effect his escape. He fled, in all probability to the coast of Wicklow, and encountered a vessel which was engaged in the export of Irish wolf-dogs. After three days at sea the traders landed, possibly on the west coast of Gaul, and journeyed for twenty-eight days through a desert. At the end of two months Patrick parted from his companions and betook himself to the monastery of Lérins, where he probably spent a few years. On leaving the Mediterranean he seems to have returned home. It was doubtless during this stay in Britain that the idea of missionary enterprise in Ireland came to him. In a dream he saw a man named Victorious bearing innumerable epistles, one of which he received and read; the beginning of it contained the words "The Voice of the Irish"; whilst repeating these words he says, "I imagined that I heard in my mind the voice of those who were near the wood of Foclut (Fochlad), which is near the western sea, and thus they cried: 'We pray thee, holy youth, to come and walk again amongst us as before.' " The forest of Fochlad was in the neighbourhood of Killala Bay, but it is possible that it extended considerably to the south. Despite his natural diffidence, and opposition on the part of his relatives, Patrick resolved to return to Gaul in order to prepare himself for his mission. He proceeded to Auxerre—a place which seems to have had a close connection with Britain and Ireland—and was ordained deacon by Bishop Amator, along with two others who were afterwards associated with him in spreading the faith in Ireland. The one was an Irishman called Fith, better known as Iserninus, the other Auxilius. Patrick must have spent at least fourteen years at Auxerre.

Mission to Ireland.—It seems not unlikely that Pelagianism had taken root among the Christian communities of Ireland, and it was found necessary to send a bishop to combat the heresy. Pope Celestine's choice fell on the deacon Palladius, who had taken a prominent part in stamping out the doctrine in Britain. Patrick probably felt great disappointment when Palladius was sent as the chosen envoy of Rome, but now Germanus seems to have decided that Patrick was the man for the task, and he was consecrated in 432. Patrick landed at Inverdea, at the mouth of the river Vartry in Wicklow, but we are not informed as to any of his doings in Leinster at this period. According to the story, he immediately proceeded northward to the kingdom of Ulidia (east Ulster), though a certain tradition represents him as going to Meath. Landing on the shores of Strangford Lough, he commenced his labours in the plain on the south-west side of that inlet. A convert chief named Dichu granted him a site for an establishment, and a wooden barn is stated to have been utilized for the purpose of worship, whence the modern Saul (Ir. *saball,* "barn"). Patrick's activity was bound to bring him sooner or later into conflict with the High-king Loigaire (reigned 428–467), son of Niall Noigiallach. Fedilmid, a brother of the monarch, is represented as having made over his estate at Trim to the saint to found a church, and thus the faith was established within Loigaire's territory.

The story makes Patrick challenge the royal authority by lighting the Paschal fire on the hill of Slane on the night of Easter Eve. It chanced to be the occasion of a pagan festival at Tara, during which no fire might be kindled until the royal fire had been lit. A number of trials of skill between the Christian missionary and Loigaire's Druids ensued, and the final result seems to have been that the monarch, though unwilling to embrace the foreign creed,

[1]His career is involved in considerable obscurity. Widely varying views have been held by modern scholars with regard to his activity, some going so far as to treat all the accounts of his labours as the fictitious creation of a later age. In the present article Bury's reconstruction of the saint's life has been chiefly followed. Apart from its importance in other respects, Bury's treatment of the subject has at any rate the merit of defending the traditional view of St. Patrick's career.

undertook to protect the Christian bishop. At a later date the saint was probably invited by Loigaire to take part in the codification of the *Senchus Mór* in order to represent the interests of the Christian communities. On another occasion Patrick is reported to have overthrown a famous idol known as *Cenn Cruaich* or *Cromm Cruaich* in the plain of Mag Slecht (county Cavan).

Patrick is stated to have visited Connaught on three different occasions and to have founded churches, one of the most important being that at Elphin. As regards Ulster our information is very scanty, though we find him establishing churches in the three kingdoms of the province (Ailech, Oriel and Ulidia). Patrick's work is more closely identified with the north of Ireland than with the south Traces of his mission, however, are to be found in Ossory and Muskerry. But his task in the south was doubtless rather that of an organizer, and a kind of circular letter has come down to us which was addressed by Patrick, Auxilius and Iserninus, to all the clergy of the island There is some evidence that he made a journey to Rome (441–443) and brought back with him valuable relics. On his return he founded the church and monastery of Armagh, the site of which was granted him by Daire, king of Oriel, and it is probable that the see was intended by him to be specially connected with the supreme ecclesiastical authority. Some years before his death, which took place in 461, Patrick resigned his position as bishop of Armagh to his disciple Benignus, and possibly retired to Saul in Dalaradia, where he spent the remainder of his life. The place of his burial was a matter of dispute in early Ireland, but it seems most likely that he was interred at Saul

Writings.—Two highly important documents purporting to have been written by Patrick have come down to us The one is the Confession, which is contained in an imperfect state in the Book of Armagh (*c* 807), but complete copies are found in later mss. The Confession, written towards the end of his life, gives a general account of his career Various charges had been brought against him by his enemies, among them that of illiteracy, the truth of which is borne out by the crudeness of his style, and is admitted by Patrick himself The other document is the so-called Letter to Coroticus, a British king of Strathclyde, whose soldiers had in the course of a raid in Ireland killed a number of Christian neophytes on the very day of their baptism while still clad in white garments. Others had been carried off into slavery, and a deputation of clergy which Patrick had sent to ask for their release had been subjected to ridicule. In his Letter the saint in very strong language urges the Christian subjects of the British king not to have any dealings with their ruler and his bloodthirsty followers until full satisfaction should have been made. The text of this letter occurs in a number of mss but is not contained in the Book of Armagh It is however certain that it was known in the 7th century A strange barbaric chant commonly known as the Lorica or Hymn of St Patrick is preserved in the *Liber hymnorum*. This piece, called in Irish the *Faed Fiada* or "Cry of the Deer," contains a number of remarkable grammatical forms, and late editors believe that it may very well be genuine.

From such slender material it is not easy to form a clear conception of the saint's personality His was evidently an intensely spiritual nature, and in addition to the qualities which go to form a strong man of action he must have possessed an enthusiasm which enabled him to surmount all difficulties His importance in the history of Ireland and the Irish Church consists in the fact that he brought Ireland into touch with western Europe and more particularly with Rome, and that he introduced Latin into Ireland as the language of the Church His work consisted largely in organizing the Christian societies which he found in existence on his arrival, and in planting the faith in regions which had not yet come under the sway of the gospel

AUTHORITIES —Apart from the Letter and Epistle mentioned above our chief sources of information with regard to the life of St. Patrick are contained in the Book of Armagh. The one is the memoir by Tírechán, a bishop who had been the disciple of Bishop Ultan of Ardbraccan in Meath (d 657) The first part of this memoir, which was probably compiled about 670, deals with the saint's work in Meath, the second with his activity in Connaught. Various additions are appended to this compilation, and there are still further additional notes. The other biography was written towards the end of the 7th century by Muirchu Maccu Machtheni, who dedicated his work to Bishop Aed of Slébte (d. 700). (*See* edition by N. J. D. White, 1920). The first portion deals with Patrick's career down to his arrival in Ireland and contains an unvarnished statement of fact. But when the story passes to Ireland Muirchu's narrative becomes full of the mythical element. Muirchu influenced later biographies. Bury has shown that both Tírechán and Muirchu drew from written material which existed in part at any rate in Irish. Among later lives we may mention the hymn *Genair Patraicc*, commonly attributed to Fíacc, which is considered by the latest editors to have been originally composed about 800. Three anonymous Latin lives were published by Colgan in his *Trias Thaumaturga* (Louvain, 1645), and there exists an 11th-century Irish life in three parts published by Whitley Stokes for the Rolls series (1887) A Latin translation of a different copy of this work, now lost, was published by Colgan. Lastly a life by an otherwise unknown Irish writer named Probus occurs in the Basel edition of Bede's works (1563) and was reprinted by Colgan.

PATRIOTIC SOCIETIES, organizations formed in many countries, for the purpose of commemorating historical events of the past, preserving the records and sites of such events, and, in general, fostering a spirit of patriotism and love of country Such societies are especially numerous and influential in the United States The oldest, the Society of the Cincinnati (*q v*), dates back to the Revolutionary War, but others of importance were not founded until the last quarter of the 19th century The chief societies in the United States, with the dates of their organization, are the Society of Mayflower Descendants (1897), Colonial Dames of America (1890), Society of Colonial Wars (1893), Sons of the Revolution (1876), Daughters of the Revolution (1891), Sons of the American Revolution (1889), Daughters of the American Revolution (1890) and the Sons of Veterans (1879). The Daughters of the Confederacy (1894) and the Sons of Confederate Veterans (1896) commemorate the spirit and sacrifices of the Confederate cause in the Civil War Eligibility for membership in all the above is based upon the historical services of an ancestor. The Grand Army of the Republic, formed by the Union soldiers after the American Civil War, long possessed a political as well as social importance A similar organization of the World War veterans of the United States is the American Legion (*q v*) There are also many local societies formed usually for the preservation of historical sites and one national body of importance known as the American Scenic and Historic Preservation Society

See S A. Phillips, *The Patriotic Societies of the United States* (1914).

PATRIZZI, FRANCESCO (FRANCISCUS PATRITIUS) (1529–1597), Italian philosopher and scientist, was born at Clissa, Dalmatia, and died in Rome He gained the patronage of the bishop of Cyprus, who brought him to Venice He was appointed to the chair of philosophy at Ferrara, and was, later, invited to Rome by Clement VIII In spite of his almost incessant controversies with the Aristotelians, he published in 15 books a treatise on the *New Geometry* (1587), and works on history, rhetoric and the art of war.

PATROCLES (*c.* 312–261 B C.), a Macedonian general and writer on geographical subjects, who lived during the reigns of Seleucus I and Antiochus I When in command of the fleet of Seleucus (285) he undertook a voyage of exploration on the Caspian Sea to discover possible trade routes, and decided that the Caspian was a gulf or inlet connecting with the Indian Ocean

See Strabo ii 68, 74, xi 508, xv 689; Diod Sic xix 100; Plutarch, *Demetrius*, 47, Pliny, *Nat Hist* vi 21; Photius, *cod.* 224 (on Memnon), W W Tarn, "Patrocles and the Oxo-Caspian Trade Route" in *Journal of Hellenic Studies*, vol xxi. (1901).

PATRON, a word of which the various meanings in European

languages are derived from that of the Lat. *patronus*. (*See* below PATRON AND CLIENT.) The earliest use of the word in English appears to have been in the special sense of the holder of an advowson, the right of presentation to a benefice. From this meaning is deduced that of the person in whom lies the right of presenting to public offices, privileges, etc. From the earliest Christian times the saints took the place of the pagan tutelary deities (*Di tutelares*) and were in this capacity called *tutelares* or *patroni*, patron-saints.

A full list of saints, with the objects of the peculiar patronage of each is given in M. E. C. Walcott's *Sacred Archaeology* (1868).

PATRON AND CLIENT. This relationship, which existed at Rome as elsewhere in Latium from time immemorial, had ceased long before the end of the republic to be of any great practical importance, and its origin is thus obscure. In any case in early Rome the hereditary bond between patron and client seems to have been not altogether unlike that which existed between a feudal lord and his man. The client was bound to follow his patron to war and to contribute to such expenses as his ransom if he were captured and the dowries of his daughters. He was also perhaps bound to work on his patron's land, and it is probable that the institution of *precarium* (tenancy at will) originated in grants of land to clients, which, though legally revocable at any time, were in fact hereditary. The ethical element was always strong; thus the patron was bound to protect his client and, in particular, to represent him or give him aid if he were involved in litigation, though whether this means that the client was originally incapable of appearing in a court of law himself is not clear. Litigation between the two was forbidden, and they might not give evidence against each other.

With the obsolescence of legal clientship in the later republic the word came to be used of those dependants whom a rich or influential man gathered round him and who attended him, for instance, at his morning levee. This relationship, often one of arrogance on the one side and servility on the other, is graphically described by Martial.

Willens, *Le Droit public romain*, 4th ed. p. 26 (Louvain, 1880) gives an account of earlier literature, as does the full article by Premerstein in Pauly's *Real-Encyclopädie der classischen Altertumswissenschaft*, 7th half vol. (Stuttgart, 1900) s.v. *Clientes*. On the clientage of the early empire *see* especially L. Friedlander, *Sittengeschichte Roms*, I. 200–212 (Leipzig, 1901).

PÄTS, KONSTANTIN (1874–), Estonian statesman, was born in the Pärner district. He studied law at Dorpat and he became in 1901 editor of the *Teatajä* (Newsheet), the first daily paper in the Estonian language. This journal maintained radical principles and gave much prominence to economic questions. Päts secured municipal administration for Estonia from the Russians, being himself appointed assistant to the mayor of Reval. During the revolution of 1905, when the Russian authorities gave way to panic, Päts was the real ruler of the town and succeeded in protecting Reval from plunder and excess. When the Russian punitive expeditions arrived he was sentenced to death by the military court, but the sentence was later commuted by the courts to imprisonment for one year. After the revolution of 1917 Päts became head of the national administration, and on the declaration of independence of Estonia on Feb. 24, 1918, he formed the first temporary Government. For his resistance to the plans for the formation of a Baltic duchy he was imprisoned by the German Occupation authorities, but on the collapse of German rule he returned to the head of the temporary Government. He fostered the steady growth of the Agrarian party. Päts became president of the Riijikogu and prime minister in 1920–22 and again in 1923.

PATTERSON, JOSEPH MEDILL (1879–), American publisher and editor, was born in Chicago (Ill.), Jan. 6, 1879. He graduated from Yale university in 1001 and joined the staff of the Chicago *Tribune*. In the year 1914 he became associated with his cousin, Robert Rutherford McCormick (*q.v.*), as co-editor and publisher of the Chicago *Tribune*, which, under their direction, rose to be one of the most influential and successful papers in the United States. He acted as war correspondent in China, 1900, and in Belgium and France, 1914–15.

His works include *A Little Brother of the Rich* (1908); *Rebellion* (1911) and *Note Book of a Neutral* (1915).

PATTI, ADELINA JUANA MARIA (BARONESS CEDERSTRÖM) (1843–1919), a famous singer, was born at Madrid on Feb. 19, 1843. Her parents, both of whom were operatic vocalists, settled in America, where their daughter was taught singing by Maurice Strakosch, who married Amelia Patti, an elder sister. Gifted with a brilliant soprano voice, Adelina Patti began her public career at the age of seven in the concert halls of New York, where, in 1859, she also made her first appearance as Lucia in *Lucia di Lammermoor*. On May 14, 1861, she sang as Amina in *La Sonnambula* at Covent Garden, and from this time her appearances in London, Paris and all the other principal musical centres of the world, constituted one long unbroken succession of triumphs. In 1868 she married Henri, marquis de Caux, a member of Napoleon III.'s household, from whom she was divorced in 1885; she then married Nicolini, the tenor, who died in 1898, and in 1899 Baron Cederström, a Swede, who was naturalized as an Englishman. Madame Patti ceased to appear on the operatic stage in public after the '80s, but at Craig-y-Nos, her castle in Wales, she built a theatre in which she loved to give private performances. Her actual last public appearance was made on behalf of the Red Cross on Oct. 20, 1914, when she was in her 72nd year. Madame Patti died on Sept. 27, 1919.

PATTISON, MARK (1813–1884), English author and rector of Lincoln College, Oxford, was born on Oct. 10, 1813. He was educated privately, and at Oriel college, Oxford; in 1839 he obtained a fellowship at Lincoln College. Pattison was at this time a Puseyite, and greatly under the influence of J. H. Newman, for whom he worked, helping in the translation of Thomas Aquinas's *Catena Aurea*, and writing in the *British Critic* and *Christian Remembrancer*. He was ordained priest in 1843, and was tutor of Lincoln College from 1843 to 1855. Pattison then travelled in Germany to investigate Continental systems of education, and began the researches into the lives of Casaubon and Scaliger, which occupied the remainder of his life. In 1861 he was elected rector of Lincoln, but he never liked the routine of university business. He died at Harrogate on July 30, 1884. His biography of *Isaac Casaubon* appeared in 1875. His *Sermons and Collected Essays*, edited by Henry Nettleship, were published posthumously (1889), as well as the *Memoirs* (1885), an autobiography deeply tinged with melancholy.

PAU, a city of south-western France, chief town of the department of Basses-Pyrénées, 66m. E.S.E. of Bayonne on the southern railway to Toulouse. Pop. (1926), 33,820. It stands on the edge of a plateau 130ft. above the right bank of the Gave de Pau (a left-hand affluent of the Adour), about 620ft. above the sea. A small stream, the Hédas, flowing in a deep ravine and crossed by several bridges, divides the city into two parts. Pau is famous as a winter health-resort.

Pau derives its name from the word *pal*, in allusion to the stakes which were set up on the site chosen for the town. It was founded probably in the early 11th century by the viscounts of Béarn, and was the residence, from 1512 onwards, of the kings of Navarre. The 14th century castle is connected with the town by a bridge, built under Louis XV. On the left of the entrance is the donjon built by Gaston Phoebus. On the north-east is the 14th century Tour de Montauzet. There is a fine collection of Gobelin and Flemish tapestries in the castle. A portion of the buildings of a Jesuit college founded in 1622 remains. Pau is the seat of a court of appeal and a court of assizes and has a tribunal of first instance, a tribunal of commerce and a chamber of arts and manufactures. In 1928 a new railway between France and Spain placed Pau in contact with Jaca in the Spanish province of Huesca.

PAUL, "the Apostle of the Gentiles," the first great Christian missionary and theologian. He holds a place in Christianity second only to that of the Founder Himself. Born and bred a strict Jew, he came to distinguish clearly between Judaism and the Gospel of Christ, and to present Christianity as the universal religion for man as man, not merely a sect of Judaism

with proselytes of its own. This, and nothing less, was the issue involved in the problem of Christianity and the Jewish Law; and it was Paul who settled it once and for all.

The primitive apostles in the main continued their Master's own practical attitude to the Law, as though the Cross here made no difference, and without seeing far into principles. But with Paul it was otherwise. For him the issue was defined by the Cross. It was "Pharisaism *or* Jesus"; and that, as he saw it, meant virtually Law *or* Love as the ultimate revelation of God. As Saul the Pharisee, he had taken the Mosaic Law in the strict sense, one demanding perfect inner and outer obedience; and he had relied on it utterly for the righteousness it was held able to confer. Hence when it gave way beneath him as means of salvation—nay, plunged him ever deeper in the Slough of Despond by bringing home his inability to be righteous by doing righteousness—he was driven to a *revolutionary* attitude to the Law *as method of justification.* "Through (the) Law" he "died unto (the) Law," that he "might live unto God" (Gal. ii. 19). By this experience not only Pharisaic Judaism, but the legal principle in religion altogether, was turned upside down within his own soul; and of this fact his teaching and career as an apostle were the outcome.

But Paul had in him other elements besides the Jewish, though these lay latent till after his conversion. As a native of Tarsus, he had points of contact with Greek culture and sentiment. As a Roman citizen likewise, conscious of membership in a world-wide systèm of law and order, he could realize the idea of a universal religious franchise, with a law and order of its own. Both these factors in his training contributed to the moulding of Paul the missionary statesman. In his mind the conception of the Church as something as catholic as the Roman empire first took shape; and through his wonderful labours the foundations of its actual realization were firmly laid.

PAUL'S LIFE

Early Life.—"Saul, who is also Paul," was "a Hebrew, of Hebrews" born, *i.e.*, of strict Jewish origin (Phil. iii. 5). Yet, as his double name suggests, he was reared amid the Dispersion, at Tarsus in Cilicia, the son of a Roman citizen (Acts xxii. 28). *Paulus* was not an uncommon name in Syria and eastern Asia Minor and was a natural one for a Roman citizen. Ramsay develops this point suggestively (*Pauline and Other Studies,* p. 65). "If we could think of him sometimes as Gaius Julius Paulus—to give him a possible and even not improbable name—how completely would our view of him be transformed. Much of what has been written about him (as a narrow, one-sided Jew) would never have been written if Luke had mentioned his full name." Nor would it have been written, if the influences due to his Tarsian citizenship (xxi. 39) had been kept in mind. Tarsus was peculiarly successful "in producing an amalgamated society in which the Oriental and Occidental spirit in unison attained in some degree to a higher plane of thought and action" (id., *The Cities of St. Paul,* 89). Accordingly Paul's letters bear traces of Hellenic culture up to the level of a man of liberal education. Whether he went beyond this to a first-hand study of philosophy, particularly of the Stoic type for which Tarsus as a university was famous, is open to question. The main difficulty in deciding on this, as on other points of contact between Paul and Hellenism, is the fact that he certainly got many of his Greek ideas through the medium of Judaeo-Greek or Hellenistic literature.

By a careful study of his letters, we can form some idea of the element in Paul's early life due to Jewish birth (Phil. iii. 4–7). Upon the "advantage" of the Jew, as "entrusted with the oracles of God" (Rom. iii. 1 *seq.*), he dwells in Rom. ii. 17 (*seq.*) in a way suggesting his own youthful attitude to "the name of a Jew." Something depends on the age at which the young Saul passed from Tarsus to Jerusalem and the school of Gamaliel; the transition would not much affect the legal element in his religious life and outlook. Nor was personal acceptance with God the sole prize that floated before his soul. The end of ends was a righteous nation, deserving the fulfilment of the divine promises. But this too could come only by obedience to the Law. Thus all that the young Pharisee cared for most hung upon the Law of his fathers.

Outwardly he attained the goal of legal blamelessness as few attained it; and for a time he may have felt a measure of self-satisfaction. But if so, a day came when the inner meaning of the Law, as extending to the sphere of desire and motive, came home to him in stern power, and his peace fled (Rom. vii. 9). For sin in his inner, real life was unsubdued; nay, it seemed to grow ever stronger, standing out more clearly and defiantly as insight into the moral life grew. To the Law he had been taught to look for righteousness. In his experience it proved but the means to "knowledge of sin," without a corresponding impulse towards obedience. Not only did it make him realize the latent possibilities of evil desire ("the evil heart," *Yetzer hara*): it also made him aware of a subtler evil, the reaction of self-will against the demands of the Law. While one impulse was in harmony with the will of God, the other was in sympathy with "the law of sin." Could the Law achieve the separation, making the whole person "die" to "the flesh" and so escape its sway? No, answered Saul's experience: the Law rather adds power to sin as egoism (1 Cor. xv. 56; Rom. vii. 11, 13). Whence then is deliverance to come? It can only come with the Messianic age and through Messiah. Then the Law would reign inwardly as outwardly, being "written on the heart," as promised in prophecy.

So may we conceive Saul's position, though not with full consciousness, before contact with Christianity. How then would the message, "Jesus is the Messiah," strike such a man? It would seem a blasphemous caricature of things most sacred. If the simple message of the first witnesses, that One whose life and preaching were largely out of harmony with the Law, as Saul understood it, had in fact been raised from the dead by Israel's God and so vindicated—to the condemnation of that generation of God's people—if this seemed to Saul mere madness, what was he to say to Stephen's views as to the Law and the people of Law, both past and present (*see* STEPHEN)? Stephen could not be right. Perish the thought! Perish, too, all those who upheld the crucified Nazarene, the accursed of the Law! For His death could mean but one of two things. Either He was, as "hung on a tree," accursed of God, or—awful alternative, yet inevitable to Saul's logical mind—the Law *relative to which He was accursed* was itself set aside. Saul turned from the suggestion as too shocking to his pride, alike in his people and in its divine Law, for him seriously to consider its alleged credentials—the Resurrection, and the supernatural power and goodness of Him whose claims it was held to confirm. Why stay to weigh the evidence of Galilean common folk (*Am-ha-aretz*), when over against it stood immemorial prescription, and the deliberate judgment of the custodians of the Law as to this man as "a deceiver"? The logic of the movement had declared itself through the mouth of Stephen; and now weak toleration must be abandoned.

Saul the Persecutor.—So Saul was driven to persecute. Yet the goading of unsatisfied intuition did not cease. We may even suspect that Stephen's philosophy of Israel's history had made an impression on his confidence in his nation's religious authorities If mistaken before, why not again? This granted possible, all turned on the evidence as to the Resurrection of the crucified Prophet of Nazareth. The joyous mien of His followers, even when confronted with death, seemed to betoken a good conscience before God. Yet Saul felt the status of the Law to be too grave an issue to depend on the probabilities of human testimony. So he plunged on, in devotion to what still seemed the cause of God against impugners of His *Torah,* but not without his own doubts. He was, in fact, finding it "hard to kick against the goad" (Acts xxvi. 14) plied in his deeper consciousness, as he followed his inherited beliefs. Still he was in the main honest (1 Tim. i. 13), and his hindrances were exceptional. Direct personal experience on the point on which all hinged, the alleged divine vindication of Jesus as Messiah-elect, following on the legal condemnation by the national authorities, was needful to open up a clear exit from his religious *impasse.*

The Vision at Damascus.—It was at this critical point that, as he neared Damascus on a mission of persecution, there was granted him—as he believed ever after in the face of all

challenge—a vision of Jesus, in risen and glorified humanity, as objective as those to the original witnesses with which in 1 Cor. xv. he classes it.

As to the sense in which this vision, so momentous in its issues, may be regarded as "objective," the following points deserve notice. On the one hand it is generally agreed (1) that Paul distinguished this appearance of the risen Jesus from his other "visions and revelations of the Lord," such as he refers to in 2 Cor. xii. 1 *sqq.*, and classed it with those to the Twelve and others which first created the belief that Jesus had been "raised from the dead"; (2) that this belief included for Paul a transformed or spiritualized body, his vision of which seems to colour his conception of the resurrection body generally (Phil. iii. 21), though he had certain traditional notions to start with; *cf.* 2 Cor. v. 1 *sqq.* On the other hand, analogies furnished by religious psychology (*e.g.*, the case of the Sadhu Sundar Singh), including a sudden vision amid light and the hearing of a voice as accompaniments of a religious crisis, affect our ability to take Saul's consciousness in the matter as a simple transcript of objective facts. But beyond this physical concomitant of his vision we cannot go historically. After all, the main point for Paul's development—as well as the basis of all theories of the vision—is the degree of discontinuity between his thought before and after the event. On this Paul is clear and emphatic, though the bearing of the modern discovery of the "unconscious" mental processes upon the fact must be left open.

Whatever was the nature of the vision, its spiritual content determined the course of his life. Jesus was, in spite of all, God's Messiah, His Righteous One, the type of true righteousness in man, through spiritual union with Whom like righteousness was to be attained, if at all. In a flash Saul's personal problem as to acceptance with God and victory over sin was changed. It became simply a question how spiritual union with this Messiah was to come about. He had vanquished and "condemned sin in the flesh" by His perfect obedience (Rom. viii. 3, v. 19), of which the Cross was now seen to be the crowning act. As for the Law as means of justification, it was superseded by the very fact that Messiah had realized His righteousness on another principle altogether than that of "works of the Law," and had in fact been crucified by its action. Thus He had died to it as a *dispensational principle*. This meant that those united to Him by faith were themselves sharers in His death to the Law as master and judge, and so were quit of its claims in that new moral world into which they were raised as sharers also in His Resurrection (Rom. vi. i.–vii. 6). Henceforth they "lived unto God" in and through Messiah, by the self-same Spirit by which He had lived the sinless life (viii. 9). Here we have at once Paul's mysticism and his distinctive gospel in germ.

The New Theory of the Law.—The old régime had dissolved. His first act was to make explicit, through confession and baptism, his submission and adhesion to Jesus as Messiah, implicit in his cry from the ground, "What shall I do, Lord?" Thereby he formally "washed away his sins" (Acts xxii. 16). Then he began boldly to proclaim in the synagogues of Damascus that Jesus, whose followers he had come to root out, was verily the Messianic Son of God (ix. 20; *cf.* Matt. xvi. 16). Yet ere long he felt the need for quiet in which to think out his new position. He withdrew to some spot in the region south of Damascus, then vaguely called Arabia (Gal. i. 17). Chief among the problems pressing for reinterpretation in the light of his recent experience was the place of the Law in God's counsels. While the Law could warn and even restrain the sinner from overt sins, it could not redeem or save him from the love of sin. In a word, it could not "give life" (Gal. iii. 21). Hence its direct remedial action was quite secondary. Its primary effect, and therefore divine purpose, was to drive men humbly to seek something more, God's grace. It "shut up all unto (realized) disobedience, that God might have mercy upon all" (Rom. xi. 32; Gal. iii. 22). Thus the place of the Law in God's counsels was episodic. The radical egoism of the natural man could be transcended, and self-glorying excluded, not by the Law, with its "law (principle) of works," but by the "law of faith" (Rom. iii. 27). In fine, the function of the Law was secondary, preparatory, temporary. Its reign closed when its work in shutting up men to faith in and through Christ—the perfect form of faith—was accomplished. Its day was over when Jesus accepted crucifixion at its hands, and so passed on to inaugurate a new "Covenant" marked by a final relation between man and God, the filial, the Spirit of which was already in the hearts of Christian believers (Gal. iii. 23–iv. 7). Thus the Cross of Jesus satisfied the claims of Law *as a dispensation* or divinely sanctioned method, which had to be honoured even in the act of being transcended, "that God might be just (*i.e.*, dispensationally consistent), while justifying the believer in Jesus" on a fresh basis (Rom. iii. 26). Such a view did but "establish the Law" (v. 31) within its own sphere, while pointing beyond it to one in which its aim, real obedience, found fulfilment.

Here lay the revolutionary element in Paul's thought in relation to Judaism. Historically, it saved Christianity from being a mere Jewish sect. But as it was conditioned by recoil from an overdriven use of the Law in the circles in which Saul was trained, so it was at times one-sided in its emphasis on the pathological workings of the Law upon human nature, in virtue of sinful egoism. Still Saul secured mankind for ever against bondage to religious legalism. In him, as F. W. Myers put it,

> Desperate tides of the whole world's anguish
> Poured through the channels of a single heart.

He first detected the specific virus generated by Law in the "natural man," and discovered the antidote in Christ. Nor had he the Jewish *Torah* exclusively in view. He deals with it rather as the classic type of law in religion. "Nitimur in vetitum cupimusque negata." This is too often overlooked by Jewish critics. Paul felt reverence for the *Torah* in what he took to be its proper place, as secondary to faith and subordinate to Christ. In short, Paul set forth the principle of *inspiration to God-likeness* by a personal ideal, in place of obedience to an impersonal Law, as condition of salvation.

Christology.—Saul's conversion left Jesus the Christ as central to his new world as the Law had been to his old. An inspiring personality superseded a static code of precepts. All was summed up in Christ, and Him crucified. This was to him the essence of Christianity as distinct from Judaism. As, to the Jew, life was lived under the law or in it as native element, so to the Christian life was "in Christ" as element and law of being. Christ simply replaced the Law as form and medium of relations between God and man. In this Paul went far beyond the older apostles, whose simpler attitude to the Law had never suggested the problem of its dispensational relation to Messiah, though in fact they relied on Messiah alone for acceptance with God. The logic of this, as Paul later urged it on Peter at Antioch (Gal. ii. 15 *sqq.*), they did not yet perceive. But the contrast goes farther. The very form in which Jesus was known to Saul by personal experience, namely, as a spiritual being—in a body already glorified in virtue of a regnant "spirit of holiness" (Rom. i. 4)—determined all his thought about Him. To this even Jesus's earthly life, real as it was, was subordinate. The extent of Paul's knowledge of the historical Jesus has been much debated. Besides his express appeals to Davidic birth, the institution of the Supper, the Death and Resurrection, and to precepts of "the Lord" (1 Cor. vii. 10, ix. 14; *cf.* Rom. xii. 14), he shows a marked insight into the character of Jesus as it is described in the Gospels (*see* 2 Cor. x. 1; *cf.* Phil. ii. 5–8). Still his attitude to Jesus was fixed by his own experience. The varied theoretic expressions in his writings of Christ's relations to God, to mankind, and even to the universe, were to him but corollaries of this.

The most persistent element in his conception of Christ's person started from his own experience, though it included the speculative postulate of pre-existence in terms of some current Messianic form of thought. That is, Paul's new Christology expressed his peculiar sense of the all-inclusive significance of Christ in his own experience. So, too, most of his distinctive thoughts on religion, sometimes called "Paulinism" (*see* p. 393), were both experimental in origin and capable of statement in terms of his Christ. To him the Death and Resurrection of Christ were not

isolated facts, nor yet abstractions, but had being within his own experience: so that here, and not in any second-hand facts touching Christ's earthly career, lay the real spiritually verified basis of the whole Christian life.

His Early Apostolate.—It is unlikely that Saul began straightway to preach all the ideas prominent in his epistles, which belong only to about 10 years at the end of a ministry of some 30. Even his special mission to the Gentiles dawned on him only gradually. No doubt, as he looked back, he felt that the final purpose of God in "revealing His Son in him" had been that he "might preach Him among the Gentiles." But this does not prove that he saw it all at once as involved in "the heavenly vision." He was intensely Jewish in feeling; "to the Jew first" was his maxim all along. Only bitter experience convinced him (Rom. ix. 1 *sqq.*, x. 1 *sqq.*) that the Jews as a people would continue to spurn their birthright in God's Messiah—until the Gentiles had come in.

Saul began his preaching in the synagogues of Damascus, especially, we may suppose, after his return from Arabia (Acts. ix. 22; Gal. i. 17). Then came his first visit to Jerusalem since conversion, in the third year from that event, for the purpose of making the personal acquaintance of Peter (Gal. i. 18), presumably to hear first-hand about Jesus's earthly ministry and teaching, as well as to make the leading apostle directly acquainted with his conversion and its fruits. Barnabas helped to dispel the suspicion with which the arch-persecutor was at first regarded. Such preaching as Saul did in Jerusalem was to the Hellenists, *e.g.*, his Cilician compatriots (ix. 29; *cf.* vi. 9). But he had to leave suddenly, apparently after a vision in the Temple which brought him fresh light as to the scope of his future ministry. During the 10 or 11 years at least "in the regions of Syria and Cilicia" which ensued, it was still primarily to the Jews that he preached; for the news of him which reached "the churches of Judaea," from time to time, was such that they "kept glorifying God" in him (Gal. i. 21–23)—as they would not have done had he addressed himself largely to Gentiles. His preaching, that is, was mostly to the Synagogue and its adherents of non-Jewish origin, whether circumcised or not. Of Saul's history, however, during these obscure years we gain only rare glimpses (*cf.* 2 Cor. xi. 24), the first and most important being in connection with the foundation at Antioch of a mixed Church of Jews and Gentiles. Whatever may have been the first beginnings of this new departure, the situation soon caused Barnabas, who had been sent from Jerusalem to supervise the work begun by Hellenist preachers, to seek Saul's co-operation; and "for a whole year" the two worked in Antioch and instructed the numerous converts—including not a few uncircumcised Gentiles. It is not clear for how long Antioch remained Saul's headquarters. But we may imagine him evangelizing also in the region between Antioch and Tarsus (Gal. i. 21; *cf.* Acts xv. 23, 41). About this time he seems to have attained quite a fresh sense of the degree to which Gentiles were destined to form part of that "Israel of God" which was being gathered through faith in Jesus as the Christ. Writing later, about A.D. 56, he speaks of having had an overpowering revelation some 13 years previously (*i.e.*, about 42–43), the very period now in question. He says nothing as to its theme; but it can hardly have been unconnected with his central preoccupation, the scope of the Church, as set forth later in Eph. ii. 11, iii. 13.

Second Visit to Jerusalem.—Fresh revelation would lead to more definite efforts to win Gentiles as such, and this again to his second visit to Jerusalem, some 11 (or 13, Gal. ii. 1) years after the former one. He would now feel the need of a clear understanding with Jerusalem touching his gospel, "lest perchance he should run in vain or have already so run" (ii. 2). Saul was not the man to wait for a foreseen evil to develop. "So, in accordance with a revelation," as he says, he with Barnabas sought private conference with the leaders in Jerusalem, to lay before them his gospel (ii. 2). The date would be *c.* 43–45. His aim was to confer solely with leaders (contrast Acts xv. 4, 12), like James and Cephas and John, the "pillars" of the Jerusalem community. But certain persons, who showed such a spirit as to make him describe them as "pseudo-brethren," managed to be present and demanded the circumcision of Titus, a Greek whom Saul had taken with him. In this demand he saw a blow at the heart of his gospel for Gentiles, and would not give way. The "pillars" themselves, too, recognized Saul and Barnabas as entrusted with a specific Gentile mission, parallel with their own to Jews. Only, as pledge that the two should not diverge but remain sister branches of Messiah's Ecclesia, until He should return and remove all anomalies, they asked that the Gentile missionaries should "remember the poor"—whether generally or those of the Mother Church. Here was a proviso which Saul was as eager as they could be to get carried out; and this he was able to prove ere long in the special form of relief to the poor in Judaea, which he and Barnabas fitly administered in person (Acts xi. 30, xii. 25). This relief visit took place about 45–46.

First Journey.—Having now reached an understanding with the "pillars" in Jerusalem, Saul felt anxious to break fresh ground, and probably broached the subject to the leaders at Antioch. As they waited on God for guidance, the Spirit directed that Barnabas and Saul be set apart for such an enterprise; and this was done in solemn form (xiii. 1–3). Naturally Barnabas thought of his native Cyprus; and thither they sailed, about spring A.D. 46 or 47, with Mark (*q.v.*) as their assistant. Their work lay at first in synagogues. But at Paphos an event occurred to which special notice is given as marking the beginning of a new prominence of Paul in the conduct of the mission (*cf.* "Paul and his company"). Further, on leaving Cyprus the mission entered the region where Paul, not Barnabas, was most at home. At Perga in Pamphylia a fresh decision was reached as to the route now to be taken; and this led to Mark's withdrawing (*see* MARK).

Perhaps in the late summer or autumn of A.D. 46 or 47 Paul arrived in Pisidian Antioch. Its population included the native Anatolian, the Greek, and the Jewish elements, so frequently found together in Asia Minor since the days of the Seleucid kings of the Hellenistic period. The Anatolian ground-stock had marked affinity with the Semitic peoples, though it was Hellenized in speech and education. Hence the enthusiasm with which Paul's gospel was received (xiii. 44 *sqq*; Gal. iv. 14 *seq.*). Here and now he uttered the memorable protest against Jewish unbelief: "It was necessary that the word of God should first be spoken to you: seeing ye thrust it from you, and judge yourselves unworthy of eternal life, lo, we turn to the Gentiles" (xiii. 46). This had at first for Paul only a local meaning, as he continued to begin in each city with the synagogue. But the emphasis laid on the incident in Acts shows that to one looking back it meant much, since henceforth Paul's work was to lie mainly among Gentiles.

Paul's experiences were much the same at Iconium. Then at Lystra, in the Lycaonian *regio* of the province, occurred the healing of a lame man at the word of Paul (*cf.* Rom. xv. 9). The story, told in a few graphic touches, sets before us Paul as the tactful missionary, meeting the needs of a simple folk with an elementary natural theology. At Derbe, the frontier city of Galatia to the south-east, Paul was within easy reach of Tarsus, his old home. But the needs of his young converts drew him back to face fresh dangers in Lystra, Iconium and Antioch, in order to encourage "the disciples." To give them the support of responsible oversight, the apostles "appointed for them elders" in each church, probably on the model of the synagogue: for Paul had a due sense of the corporate life of each local brotherhood and of the value of recognized leaders and pastors. Then they returned to Antioch, and reported to a church meeting "all that God had done with them, and how he had opened a door of faith unto the Gentiles." So ended Paul's first missionary journey known to us in detail, the very first wherein his vocation as apostle of the Gentiles took marked effect.

It was at this point, perhaps, that Paul's courage in defence of vital principle was called into action, owing to a visit of Peter to Antioch. Peter had fallen in with the custom at Antioch whereby Jewish and Gentile Christians ate together. But this was more than was understood even by James to be involved in the alliance of the two missions. It was one thing not to force Judaism on Gentile Christians; it was another to sanction table-fellowship between Gentile and Jewish Christians as full brethren. Let Peter, said James through his friends, remember Judaean feelings

as well. Was it not wrong to break with the sentiment of the Mother Church in Judaea for the comfort of Gentile brethren on the spot, whom they had but recently regarded as "unclean"? The plea swept not only Peter and the local Jewish Christians off their feet, but even Barnabas also.

But Paul saw that by their very reliance on Christ rather than the Law for justification, Jewish Christians had in principle set aside the Law as the means of righteousness: that they had virtually come down from their prerogative standing on the Law and classed themselves with "sinners of the Gentiles"; and finally that they had been led into this by Jesus the Messiah Himself. If that attitude were sinful, "then was Christ the minister of sin." If righteousness depend after all on the Law, then why did Christ die? This penetrating analysis (Gal. ii. 14–21) of the implications of Christian faith was unanswerable, as regards any legal observance as condition of justification. Thus Evangelic principle told against the expediency alleged on the Jewish side; while as for expediency in relation to the Gentiles, it was a matter not only of Antioch, and the Jews and Gentiles there involved, but also of the whole Roman world, and the relative numbers of potential converts from either class in it.

The New Issue Raised.—So far Gentile believers had been a mere minority, not essentially affecting the Jewish character and atmosphere of the Messianic "Church" (*Ecclesia*), any more than proselytes were thought to affect Judaism. But in Antioch and in Galatia uncircumcised Gentiles formed a large part, if not the majority, of the heirs to Messianic salvation. Now that the logic of facts was unfolding so as to jeopardize the Law *in toto*, it could not but appear to many Jewish Christians time boldly to deny the reality of any Gentile's portion in Messianic salvation apart from circumcision (as binding to observance of the Law). So argued those with Pharisaic antecedents, who invaded the headquarters of the liberal mission at Antioch. Paul and Barnabas took up the gage; and as the Judaizers no doubt claimed that they had the Judaean Church at their back, the local church felt that the issue would have to be decided in Jerusalem itself. So they sent up Paul and Barnabas, "and certain others of their number" (Acts xv. 2; contrast Gal. ii. 1 *seq.*), to confer with "the apostles and elders" there. The fact that Paul consented to go at all, to the seeming prejudice of his own divine commission, is best explained by his prior understanding with "the pillars" of the Judaean Church itself (Gal. ii. 1–10). His object was twofold: to secure in the centre of Judaeo-Christianity that public vindication of Gentile freedom from "the yoke of the Law" on which he felt he could count, and to save the Church from outward schism.

On the main issue there could be no compromise. It was conceded, largely through the influence of Peter and James, that the good pleasure of the Holy Spirit (xv. 28a), in possessing Gentile hearts, settled the question. But as to the need of considering age-long Jewish sentiment on points where divergent practice would tend to prevent Jewish Christians from recognizing Gentile believers as brethren, as well as place a needless stumbling-block between Jews and a Messianic society in which unlimited "uncleanness" was tolerated—on this compromise was possible. The compromise was proposed by James (xv. 20 *seq.*) and accepted by Paul. Indeed he had less to sacrifice than the other side in the concordat. For in the case of Gentile proselytes to Messianic Judaism the ritual Law was to be waived, and a *minimum* of proselyte rules, indispensable (xv. 28) to a type of piety essentially common to all "in Christ," taken as sufficient. Of the "abstinences" in question only that touching blood (in its two forms) was really a ritual matter. The other two were deductions from fundamental Christian ideas.

The above is the simplest reading of the case, especially if the question of table-fellowship (in Gal. ii. 11 *seq.*) had preceded. Some scholars dispute that Paul could have been a party to such a concordat at all. Others maintain that the reference to "things strangled" is an interpolation, not shared by the early Western text, and that "blood" meant originally homicide. Hence the rules had no reference to food apart from constructive idolatry. This theory does not remove the contradiction with Gal. ii. 10, and seems textually improbable.

At no point in his career does Paul's greatness appear more than now in his relations with Judaeo-Christianity. Equally above the *doctrinaire* temper and that of mere opportunism, he acted as a true missionary statesman, with his eye both on the larger future and the limiting present. As he himself obeyed the principle of concern for others' good by conforming his own practice to certain Jewish forms of piety (1 Cor. ix. 19 *seq.*, 22); so he was ready to enjoin on Gentiles abstinence from blood, simply as a thing abhorrent to Jewish sentiment. His was the spirit of a strong man, who can afford and loves to be generous, for the greater good of all. This is the key to his conduct all along, to keep in touch with Jerusalem, including repeated visits, in order to remove prejudice against him due to rumours.

Paul's Second Great Mission Tour.—Not long after this concordat Paul proposed to Barnabas a visitation of the churches they had jointly founded. But Barnabas made the reinstatement of John Mark as their helper a condition of so doing. To this Paul demurred on the ground that he could not be relied upon in all emergencies. Each went to his own sphere of work, Barnabas to Cyprus and Paul towards Asia Minor; and we never again read of them as together, though Paul later refers to his old colleague in kindly terms (1 Cor. ix. 6 and Col. iv. 10). He found a colleague in Silas (Silvanus), a "leading" man in the Jerusalem Church, but like himself a Roman citizen (Acts xvi. 37, 39); and started with the goodwill of the Antiochene Church, probably in summer A.D. 50. His way lay through churches of his own foundation, in one of which he found a helper to replace Mark, Timothy of Lystra, who was to be as a son to him up to the very end. Confident in the conciliatory spirit of both sides in the concordat, and anxious to show how ready he was to consider Jewish feeling where Gentile freedom was not involved, he circumcised this young semi-Jew before taking him as his associate into regions where work would still lie largely among Jews.

But the secondary issues of this visit were among the bitterest in Paul's life, owing to the unscrupulous action of Judaizers who, in his absence, began a subtle propaganda amongst his converts in this region. Had not Paul himself confessed the value of circumcision (v. 11) in the case of Timothy, the son of a Gentile father? As for his earlier policy, it must have been due simply to a wish to humour his converts' prejudices (i. 10), to begin with. At any rate the gospel they now brought was the authentic Apostolic Gospel; and if Paul's did differ from it, so much the worse for his gospel, since it could in no case claim to be other than derived from theirs (i. 1–9, 11 *seq.*). How plausible must such a plea have seemed to inexperienced Gentile converts, "bewitching" their minds away from the central facts: Christ crucified and the free gift of the Spirit through faith in Him. But how disingenuous as regards Paul's real position! Can we wonder at the indignation of his reply, and that he was goaded on to pass a counter-judgment upon their motives too sweepingly severe (vi. 12 *seq.*)? In any case the gross abuse by the Judaizers of Paul's promulgation of the "abstinences" in Galatia fully explains his contrary practice elsewhere.

European Mission.—Paul left his Galatian converts about autumn A.D. 50, for the adjacent province, "Asia." But not even yet was he to preach there, being diverted by something in which he saw the divine hand; and when later he tried to enter Bithynia, he was again turned aside by "the spirit of Jesus." His course seemed open only westwards to the coast, which was reached at Troas, a chief port of transit from Asia to Macedonia. It was a new departure to which Paul there found himself summoned, when in a night-vision "a certain Macedonian" stood as if entreating him: "Come over into Macedonia and help us." Here was the positive guidance to which two negative divine interventions had been leading up. Paul hesitated not a moment, though the idea was bolder than that of his own frustrated plan. "Straightway," in the words of Luke, "we sought to go forth into Macedonia, concluding that God had called us to preach the Gospel unto them." The mission began at Philippi, a Roman *colonia* Here the Jewish settlement, in which as usual Paul sought first to gain a footing, was a small one, consisting in the main of women—who enjoyed much freedom in Macedonian society. But

the normal extension of his work was cut short by an incident characteristic both of the age and of the way in which the fortunes of the Gospel were affected by the vested interests around it. The story of Paul's imprisonment again illustrates his quiet mastery of any situation. Next came Thessalonica, the real capital of the province (*see* THESSALONIANS).

But Jewish jealousy was soon aroused, particularly by the loss of their converts; and in alliance with the rabble of the market place, it was able once more to cut short the preachers' work. The charge made had a serious ring, since it involved not only danger to public order but treason against the emperor and the imperial cult (*laesa majestas*). On the other hand, Paul himself, in alluding (2 Thess. ii. 3–12) to both emperor and empire (6 *seq.*) as the force at present restraining "the mystery of lawlessness" (ἀνομία), seems to see the beginnings of "the apostasy" of God's own people, the Jewish nation—as once before under Antiochus Epiphanes, the prototype of "the man of lawlessness" seated in "the temple of God"—in so unhallowed an alliance as that which existed at Thessalonica between Judaism and paganism. For the former was using the very Messianic idea itself to stir up the latter against the followers of Jesus (Acts xvii. 7). Paul withdrew to Beroea, in Thessaly, and then by sea to Athens.

At Athens he soon drifted, after the manner of the place, into informal debate with casual listeners in the Market-place (*Agora*). The scope of his doctrine, the secret of right living, was such as to attract the notice of the Epicureans and Stoics. But its actual content seemed to them a strange farrago of Greek phrases and outlandish talk about a certain "Jesus" and some power associated with him styled "the Resurrection"; and Paul's attempt to lead up to his gospel by the natural theology of monotheism missed its mark. The real effect of the episode was upon Paul himself and his future methods among typical Greeks.

Paul soon moved on to Corinth, where he was to win success and find material for such experiences, both when present and absent, as developed the whole range of his powers of heart and mind (*see* CORINTHIANS, EPISTLES TO THE). Corinth was more typical of the Graeco-Roman world than any other city visited by Paul. No wonder that Paul's first feeling was one of utter impotence. It was "in weakness, and in fear, and in much trembling," that he began a most fruitful ministry of a year and a half. His guiding principle was to trust solely to the moral majesty of the gospel of the Cross, declared in all simplicity as to its form (1 Cor. ii. 1 *sqq.*), not heeding its first impression upon the Jew of intolerable humiliation, and on the Greek of utter folly (i. 18 *sqq.*). Before his great work began, Paul gained two fresh fellow-workers, whose share in parts at least of his later ministry was very great, Aquila, a Jew of Pontus, and his talented wife Priscilla. Probably they were already Christians; and as they, too, were tent-makers Paul shared their home and their work. Ere long there came the usual breach with the synagogue. The definite turning to the Gentiles met with much success, and Paul was encouraged by a night vision to continue in Corinth for more than a year longer. It was during his first winter at Corinth, A.D. 51–52, that Paul wrote his earliest extant missionary letters—to the Thessalonians (and perhaps Galatians). He wrote not as a theologian but as the prince of missionaries. His gospel was always in essence the same; but the form and perspective of its presentation varied with the training, mental and moral, of his hearers or converts. It was no abstract, rigid system. This warns us against hasty inferences from silence, and so limits our attempt to trace progress in his theology. It bears also on our estimate of him as a man and an apostle, asking from men only such faith as could be real to them at the time. The special perspective of his first two epistles is affected by the brevity of his stay at Thessalonica and the severity of persecution there. Owing to the latter fact the early return (Parousia) of Christ, as a vindication of their cause so near as reasonably to influence conduct (1 Thess. iv. 11), had naturally been prominent in his teaching among them. Further, the moral fruits of the new life in the Spirit are here enjoined in a very direct manner (iv. 1–8).

Paul as Ethical Teacher.—What was distinctive of Paul's ethical teaching was the intimate way in which he, like his Master, infused precepts with the spirit in which and by which they were to be realized, as varied aspects of the ideal of love to God and man. He was supremely concerned with the dynamic of conduct, as to which his own experience made him the most inspiring of teachers and the greatest interpreter of the mind of Christ. The master motive on which he relied for all, was the imitation of Christ in a peculiarly inward sense. To the believer Christ was no mere external example, but was already within him as the principle of his own new moral being, in virtue of indwelling "holy Spirit," the Spirit of Christ. Christian righteousness was *inspired* virtue. Here lay the new "power" so characteristic of the Gospel (Rom. i. 16), a motive adequate to the enhanced moral ideal in Christ. The wonder of it was that this power annulled the moral past, giving the once vicious an equal freedom with the "virtuous." To this sovereign, emancipating influence of God's holy Spirit, antagonizing "the flesh" and all its works, Paul confidently entrusted his converts for "sanctification" or progressive transformation (Gal. iii. 3, v. 16 *sqq.*) into "the image of Christ," the full actuality of the type already latent in Christian faith. Such teaching is implicit in the Thessalonian letters; but it is explicit in the Epistle to the Galatians. But how would it be taken by raw Gentiles, say in Corinth, untutored to self-denial, in things whether of sense or spirit? That their egoism often perverted Paul's libertarianism into an apology for libertinism, in keeping with current habits, as well as for selfish individualism in the use of intellect or even "gifts of the Spirit," may be gathered from his letters to Corinth. What here concerns us, however, is the splendidly positive way in which Paul met such abuses, not by falling back upon legalism as a "safeguard" against licence, but by reapplying the laws of spirituality.

In Corinth.—Side by side with the religion of the city and of the family, polytheistic and utilitarian in the main, stood the "mysteries" or esoteric cults, which were sought out and participated in by the individual for the satisfaction of essentially personal religious needs. Clearly those trained by such mysteries would be more drawn than ordinary polytheists to his gospel, with its doctrine of mystical yet real union with the Divine in Christ, and with its message of life through death. This being so, we shall not be surprised to find, especially at Corinth, traces of the reaction of conceptions proper to the mysteries upon the ideas and practices of Paul's converts (*cf.* 1 Cor. xv. 29), and even upon the language in which he set forth his meaning to them (*see* ii. 6 *sqq.*). Whether Paul himself was influenced by such ideas, *e.g.*, in relation to the sacraments, is another question.

Third Great Journey.—After some 18 months in Corinth, Paul decided to break fresh ground—now at last, perhaps, at Ephesus, the key to the province of Asia. He took with him his fellow-workers Priscilla and Aquila, and left them at Ephesus while he himself visited Syria. After some stay there, he started, before autumn A.D. 53, for his third great campaign. Passing through south Galatia, where he further fortified his converts (xviii. 23), he would reach Ephesus before winter closed in. Already his circle of helpers had gained a fresh member of great gifts, the Alexandrine Jew Apollos (*q.v.*). He had been brought into fuller sympathy with the Pauline gospel by Priscilla and Aquila; and, learning from them the situation in Corinth, had gone to try to overcome Jewish criticism there (xviii. 24–28). At first Paul taught in the synagogue, until hostility drove him to "separate the disciples" and transfer his headquarters to "the school of Tyrannus." This was a lecture-room such as "sophists" or *rhetors* were wont to use for their "displays," and many doubtless would at first regard Paul as a new lecturer on morals and religion. His influence radiated throughout the whole province of Asia, partly through visitors to Ephesus, and partly through lieutenants, such as Timothy and Epaphras (Col. i. 7; iv. 13). The latter part of his stay at Ephesus was full of trials due to his success affecting trades dependent on the cult of the Ephesian Artemis. His words, "humanly speaking, I fought the beasts at Ephesus" (1 Cor. xv. 32), may mean that he was almost torn in pieces by mob fury. Indeed he lived much of his time in Ephesus as one under daily sentence of death, so constant was his danger.

At this point of the narrative we are brought to the most pain-

ful episode in Paul's career, a psychological crucifixion of which we have the vivid record in his correspondence with the Corinthian church (*see* CORINTHIANS). There were misunderstandings on the part of large sections of it, which strained relations with Paul and impaired his apostolic authority in their eyes. In this connection the presence of interloping Jewish "apostles," with their claims for themselves and their insinuations as to Paul's motives (2 Cor. xii. 14–16), greatly complicated and embittered the situation on both sides. In the end, as 2 Cor. shows, the bulk of the Church saw its mistake and proved its loyalty.

The Second Epistle to the Corinthians was written from Philippi or Thessalonica (ix. 2); and Timothy joins in its opening salutation. He had, it seems, been summoned from Ephesus by a hurried note of Paul's from Macedonia, on the way to Corinth. In it he is informed that Erastus had remained in Corinth, while Paul had been deprived also of the help of Trophimus, so that Timothy was unexpectedly needed at his side.

For us the great event of this visit to Corinth is the writing of that epistle which shows that his mind was now bent on the extension of his mission westwards to the metropolis of the empire itself. To Rome his thoughts had been turned for many a year, but he had time and again checked the impulse to visit it (Rom. xv. 22 *seq.*). The city had long been occupied by the Gospel in one form or another; and it was a point of honour with him to preach "where Christ was not named," not to build on others' foundations (xv. 20). But his eye was now fixed on Spain, if not also on south Gaul. It was, then, largely as basis for his mission to the western Mediterranean that Paul viewed Rome. Yet after all Rome was the focus of the world. Paul could not simply pass by it (i. 11 *seq.*). Paul looked westwards at this time. Yet his heart turned also to Judaea, where he felt his line of march still threatened by the danger of disunion in the very Body of Christ. At all cost this must be averted. The best hope lay in a practical exhibition of Gentile sympathy with the Mother Church in Jerusalem. The means for such a thank-offering for benefits received, ultimately from Jerusalem (Rom. xv. 27), had been collected with patient labour; and the delegates to accompany Paul with it had already assembled at Corinth (xx. 4). Paul had intended to cross the Aegean from Corinth with his party, by the direct route to Syria. But a Jewish plot, to take effect on the voyage, caused him to start earlier by the longer land-route, as far as Philippi; whence, after waiting to observe the Days of the Unleavened Bread, he sailed to join his fellow-almoners at Troas. There is no need to follow all the stages of what follows (*see* Ramsay, *St. Paul the Traveller*). But every personal touch is meant to tell, even Paul's walk from Troas to Assos, perhaps for solitary meditation, away from the crowded ship; and all serves to heighten the feeling that it was the path to death that Paul was already treading (xx. 23). This lies at the heart of his impressive farewell to the Ephesian elders, a discourse which gives a vivid picture of his past ministry in Ephesus. Its burden, as *Luke is at pains to emphasize* by his comment upon the actual parting, is that "they should behold his face no more." But Paul, though moved in his feelings, was not to be moved from his purpose.

Last Visit to Jerusalem.—He went forward, having arranged with a trusty host at Jerusalem in the person of Mnason, a Hellenist of Cyprus; and entered the holy city in good time to show his loyalty to the Jewish Feast of Pentecost. He was well received by James and the elders of the Church. So far scholars are agreed, since the "we" form of narrative, which began again at Philippi (xx. 5), reaches to this point. But as to the historical value of what follows, before "we" reappears with the start for Rome, there is diversity of opinion. The present writer, holding that "we" is no exclusive mark of the eye-witness (*see* ACTS), sees no reason to distrust the narrative in Acts xxi. 19–xxvi. We are not told how the Gentile offering of loyal love was met by the Jerusalem Church as a whole. That its general effect upon the comity of the two branches of the Messianic Ecclesia was good, seems implied by the serene tone of Paul's later references to the unity of the Body (Eph. ii. 19–22; iii. 5 *seq.*). What does stand out clearly in Acts is all that bears on Paul's position as between the Jewish and the Roman authorities. Here we observe a gradual shifting of the charge against him, corresponding in part to the changes of venue. The more local elements recede, and those of interest to a Roman court emerge. And here the transference of the case from the provincial court to Nero's own appeal court at Rome was of ill omen. The last words of Agrippa, "This man could have been set at liberty had he not appealed to Caesar," are probably recorded with a touch of tragic irony.

Rome.—The journey to Rome calls for no detailed notice (*see* Ramsay, *St. Paul the Traveller*). Its main interest for us is the impression of nobility, courage and power, which Paul conveyed to the centurion Julius and his fellow-passengers generally; while the enthusiasm of the eyewitness himself visibly rises as dangers thicken and Paul rises above them all. At last Italy is reached, and Paul is met by "brethren" from Rome, who came 30 or 40 miles to welcome him; "whom when Paul saw, he thanked God and took courage." From Paul's letters, however, we gather that if he looked for sympathy from the Roman Church he looked largely in vain. Whilst some welcomed, and most regarded him as indeed a champion of the Gospel, whose fearless testimony even in bonds emboldened many—including the Judaizing section who wished him no good—to preach Jesus more openly than before; few, if any, really showed him brotherly love or cared for the interests of Christ outside Rome that were on his heart (Phil. i. 12–17, ii. 21). Such absorption in their own affairs struck Paul as strangely un-Christian, and added disappointment to irksome confinement, chained as he was by one wrist to a praetorian soldier night and day. Yet he rose above it all. Only let "Christ be magnified" in his body, whether by life or death.

Epistles from Rome.—The letter which makes us aware how things lay is Philippians, the most devotional of all his writings. It flows from his heart as joyful thanks for tokens of continued mindfulness of him recently received from his old Philippian friends through Epaphroditus, one of their number. Touched and filled with spiritual joy, he turns to comfort his friends in their sorrow for him, out of the stores of Divine consolation received through his own fresh sense of need (*cf.* 2 Cor. i. 3 *sqq.*). "Rejoice in the Lord" is its recurring note. Here we get the word of the hour, both for Paul and for his converts.

Of the remaining epistles written during his imprisonment in Rome, the little note to Philemon touching his slave Onesimus casts fresh light on Paul "the Christian gentleman," by its humour and considerateness. The two larger ones do not seem at first sight to reflect his personality so much as his life as the father of churches, and the way in which he extended the lines of his gospel, to bear on problems raised by ever fresh reactions upon it of the old traditions amid which his Asian converts still lived (*see* COLOSSIANS). Both aspects really blend; for the epistles are addressed to churches which were feeling certain effects of the seeming calamity that had overtaken him whom they in some sense regarded as their founder, and aim at raising them to the writer's own higher standpoint (Eph. iii. 13, vi. 19–22; Col. ii. 1 *seq.*, iv. 8 *seq.*).

The Pastoral Epistles.—In the so-called Pastoral Epistles the same subjects in the main are handled similarly, yet more summarily, as befits one writing instructions to friends familiar with the spirit behind his concrete precepts. Allowing for this, and for the special circumstances presupposed, there is no more "moralism" about the "wholesome instruction" in the Christian walk given in these epistles (1 Tim. i. 10; *cf.* vi. 3; 2 Tim. iv. 3) than in the other group. "Moralism" is ethical precept divorced from the Christian motive of grateful love, or connected with the notion of salvation as "of works" rather than prevenient grace. But of this there is no real trace in the Pastorals, which are a type of letter by themselves as regards their recipients and certain of the aspects of church life with which they deal. As dealing with methods of instruction and organization, which must have increasingly occupied the attention of those responsible for the daily course of church life, they contain nothing inappropriate to the last two years of Paul's life, when he was considering how his churches might best be safeguarded from errors.

self set forth the Gospel in the same perspective as a devoted disciple of His? Must not the personal embodiment of the life of the Messianic kingdom by Jesus himself, and so His personality, become the prime medium through which this life in its essential features, and especially in its spirit of devoted love, attains and maintains its hold upon the souls of men? Surely the new life must appear most fully and movingly *sub specie Christi;* and the *imitatio Christi,* in an inner sense which finds in Him the very principle of the new Christian consciousness as to God and man, must be the most direct and morally potent means to the realization of the Christ-type. Thus to say that Paulinism is practically and proximately "Christocentric," is not to deny that it is ultimately and theoretically "Theocentric," if only Christ's *personality* be regarded as the revelation of God the Father—even if in virtue of unique community of nature with Him, as Son. It may be questioned whether Paul attained, or indeed had within his reach in that age, the best intellectual equivalent of his religious intuition of Christ as "mediator between God and man." But it is another matter to question whether his intuition, that the personality of the Christ Himself was the secret of the spiritual power latent in his Gospel, be a true interpretation of the Gospel, as it appears even in the Synoptics. Thus the truth seems to lie rather with those who see in Paul "Jesus's most genuine disciple" (H. Weinel), the one who best understood and reproduced His thought. True, Jesus saw the Gospel through the sinless consciousness of a Saviour, while Paul saw it ever through the eyes of a conscious sinner. But that is the perspective in which mankind generally has to view the Gospel; and apart from the special quality of Paul's personal experience of sin, the Gospel as it "found" him may surely be in principle the needful experimental complement to the Gospel as set forth by Jesus Himself. By restoring Jesus's own stress upon "eternal life" as present rather than future, Paul saved Christianity from a Judaizing of the universal and spiritual religion of "grace" rather than legal merit, with which Jesus had in fact inspired His personal disciples.

No doubt there is another side to all this, the side of Paul's idiosyncrasy, both religiously and as a thinker. Paul's special religious experience has proved a limitation to his direct and full influence. While "numberless men have discovered themselves in reading Paul," more have not been "found" by him; and of those who have felt the religious appeal of his writings, not a few have misunderstood the theoretic setting of his message. Indeed misunderstanding, one way or another, was Paul's usual lot in the ancient Church (especially for Greeks and Romans) as regards his most distinctive ideas, due partly to the difficult form in which some of those ideas were couched. But to say this is little more than saying that Paulinism is a less universal form of the Gospel than that given it by his Master, Jesus Christ. To do full justice to Paulinism in this respect, we must compare it with other interpretations of Jesus and His Gospel in the age immediately ensuing. At the one extreme stands Judaeo-Christianity, with its ultra-conservatism and undeveloped spirituality; at the other Gnosticism, with its ultra-spiritualism, born of rigid dualism and a defective sense for historical continuity in revelation. Between these stands Paul, blending the positive ideas of both in a religious unity of immense ethical power and initiative; while the other and intermediate types represented in the New Testament all testify to his pervasive influence.

BIBLIOGRAPHY.—For this, in its immense range, *see* the articles "Paul" in Hastings's *Dict. of the Bible,* the *Ency. Bib.*, and C. Clemen, *Paulus* (1904). The following works may be taken as fairly typical:—

1. For Paul's *Life:* Lives by E. Renan, T. Lewin, Conybeare and Howson, F. W. Farrar, A. Sabatier (*see* 2); C. Weizsäcker, *Das Zeitalter* (Eng. trans., 1894), W. M. Ramsay, *St. Paul the Traveller and Roman Citizen* (1896), C. Clemen, B. W. Bacon (1905), A. Deissmann, *St Paul* (1912); T. R. Glover, *Paul of Tarsus* (1925). Some of these deal largely with Paul's teaching.

2. For *Paulinism:* Baur's *Paulus* (1845, 1866); E. Reuss, *Hist. de la théol. chrét. au siècle apostolique,* tome ii. (Eng. trans., 1872); B. Jowett, essays in his *Epistles of St. Paul to the Thess., etc.;* J. B. Lightfoot, dissertations in his *Commentaries;* Matthew Arnold, *St. Paul and Protestantism;* O. Pfleiderer, *Hibbert Lecture* (1885); A. Sabatier, *L'Apôtre Paul* (1881); J. F. Clarke, *The Ideas of the Apostle Paul* (1884); G. B. Stevens, *The Pauline Theology* (1892); A. B. Bruce, *St. Paul's Conception of Christianity* (1894); G. Matheson, *The Spiritual Development of St. Paul;* brief sketches by W. Bousset, H. Weinel, W. Wrede, P. Wernle, and A. Jülicher (in *Die Kultur der Gegenwart,* 1905, I. iv. i. 69–97) *cf.* W. Sanday, article "Paul" in *Dict. of Christ and the Gospels* (1908), where the literature bearing on "Jesus and Paul" will be found; F. Prat, *La Théol. de S. Paul* (1908); A. E. Garvie, *Studies in Paul and his Gospel* (1911); W. Morgan, *The Rel. and Theol. of Paul* (1917); C. H. Dodd, *The Meaning of Paul for to-day* (1920); A. Deissmann, *The Rel. of Jesus and the Faith of Paul* (1923); C. A. Scott, *Christianity acc. to St. Paul* (1927); S. Cave, *The Gospel of St. Paul* (1928). (J. V. B.)

PAUL I., pope from 757 to 767, succeeded his brother Stephen III. on May 29, 757. He died on June 28, 767. His successor was Stephen IV.

PAUL II. (Pietro Barbo), pope from Aug. 30, 1464, to July 26, 1471, was born at Venice in 1417. He was made cardinal-priest of Sta. Cecilia, then of St. Marco by Nicholas V., was a favourite of Calixtus III. and was unanimously and unexpectedly elected the successor of Pius II. He immediately declared that election "capitulations," which cardinals had long been in the habit of affirming as rules of conduct for future popes, could affect a new pope only as counsels, not as binding obligations. He opposed the domineering policy of the Venetian government in Italian affairs. His repeated condemnations of the Pragmatic Sanction of Bourges resulted in strained relations with Louis XI. of France. He pronounced excommunication and deposition against King George Podiebrad on Dec. 23, 1466, for refusal to enforce the Basel agreement against the Utraquists, and prevailed on Matthias Corvinus, king of Hungary, to declare war against him on March 31, 1468. Matthias was not particularly successful but George Podiebrad died on March 22, 1471. The pope carried on fruitless negotiations (1469) with the emperor Frederick III. for a crusade against the Turks.

Paul endeavoured to make drastic reforms in the curia, and abolished the college of abbreviators (1466). He suppressed the Roman academy, but on religious grounds. On the other hand he was friendly to Christian scholars; he restored many ancient monuments; made a magnificent collection of antiquities and works of art; built the Palazzo di St. Marco, now the Palazzo di Venezia; and probably first introduced printing into Rome. He began in 1469 a revision of the Roman statutes of 1363—a work which was not completed until 1490. Paul established the special tax called the *quindennium* in 1470, and by bull of the same year (April 19) announced the jubilee for every twenty-five years. He began negotiations with Ivan III. for the union of the Russian Church with the Roman see. He died on July 26, 1471, and was succeeded by Sixtus IV.

The principal contemporary lives of Paul II., including that by Platina, are in L. Muratori, *Rerum ital. scriptores,* iii. pt. 2, and in Raynaldus, *Annales ecclesiastici* (1464–1471). There is an excellent article by C. Benrath in Hauck's *Realencyklopädie.*

PAUL III. (Alessandro Farnese), pope from 1534 to 1549, was born on Feb. 28, 1468. As a pupil of the famous Pomponius Laetus and, subsequently, as a member of the circle of Cosmo de' Medici he received a finished education. His advancement was rapid. To the liaison between his sister Giulia Farnese Orsini and Alexander VI. he owed his cardinal's hat; but the steady favour which he enjoyed under successive popes was due to his own cleverness and capacity for affairs. His election to the papacy, on Oct. 13, 1534, to succeed Clement VII., was virtually without opposition.

Paul's instincts and ambitions were those of a secular prince of the Renaissance; but circumstances forced him to become the patron of reform. By the promotion to the cardinalate of such men as Contarini, Caraffa, Pole and Morone, and the appointment of a commission to report upon existing evils and their remedy, the way was opened for reform; while by the introduction of the Inquisition into Italy (1542), the establishment of the censorship and the Index (1543) and the approval of the Society of Jesus (1540), agencies were set on foot for combating heresy.

But in the matter of a general council, so urgently desired by the emperor, Paul showed himself irresolute and procrastinating. Finally on Dec. 13, 1545, the Council assembled in Trent; but when the victories of Charles V. seemed to threaten its inde-

pendence it was transferred to Bologna (March 1547) and not long afterwards suspended (Sept. 1549). He concluded the truce of Nice (1538) between Charles and Francis, and contracted an alliance with each. But the peace of Crespy and the emperor's negotiations with the Protestants (1544) turned him against Charles, and he was suspected of desiring his defeat in the Schmalkaldic War. The most deplorable weakness of Paul was his nepotism. *See* FARNESE: *Family*.

Paul was gifted and cultured, a lover and patron of art. He began the famous Farnese Palace; constructed the Sala Regia in the Vatican; commissioned Michelangelo to paint the "Last Judgment," and to resume work upon St. Peter's; and otherwise adorned the city. Easy-going, luxurious, worldly-minded, Paul was not in full sympathy with the prevailing influences about him.

See Panvinio, continuator of Platina, *De vitis pontiff. rom.*; Ciaconius, *Vitae et res gestae summorum pontiff. rom.* (Rome, 1601–02, both contemporaries of Paul III.); and also the extensive bibliography in Herzog-Hauck, *Realencyklopädie, s.v.* "Paul III."

PAUL IV. (Giovanni Pietro Caraffa), pope from 1555 to 1559, was born on June 28, 1476, of a noble Neapolitan family. His ecclesiastical preferment he owed to the influence of an uncle, Cardinal Oliviero Caraffa. Having filled the post of nuncio in England and Spain, he served successive popes as adviser in matters pertaining to heresy and reform. But he resigned his benefices, and, in conjunction with Cajetan, founded the order of the Theatines (1524) with the object of promoting personal piety and of combating heresy by preaching. In 1536 Paul III. made him cardinal-archbishop of Naples and a member of the reform commission. After the failure of Contarini's attempt at reconciliation with the Protestants (1541) the papacy committed itself to the reaction advocated by Caraffa; the Inquisition and censorship were set up (1542, 1543), and the extermination of heresy in Italy undertaken with vigour.

Elected pope, on May 23, 1555, in the face of the veto of the emperor, Paul regarded his elevation as the work of God. With his defects of temper, his violent antipathies, his extravagant motion of papal prerogative, his pontificate was filled with strife. He joined with France (1555) in order to drive the "accursed Spaniards" from Italy. But the victory of Philip II. at St. Quentin (1557) and the threatening advance of Alva upon Rome forced him to come to terms and to abandon his French alliance. He denounced the peace of Augsburg as a pact with heresy; nor would he recognize the abdication of Charles V. and the election of Ferdinand. By insisting upon the restitution of the confiscated church-lands, assuming to regard England as a papal fief, and requiring Elizabeth, whose legitimacy he aspersed, to submit her claims to him, he raised insuperable obstacles to the return of England to the Church of Rome.

Paul's attitude towards nepotism was at variance with his character as a reformer. An unworthy nephew, Carlo Caraffa, was made cardinal, and other relatives were invested with the duchies of Paliano and Montebello. It was Paul's hope in this way to acquire a support in his war with the Spaniards. But the defeat of his plans disillusioned him, and he turned to reform. A stricter life was introduced into the papal court; the regular observance of the services of the Church was enjoined; many of the grosser abuses were prohibited. These measures only increased Paul's unpopularity, so that when he died on Aug. 18, 1559, the Romans vented their hatred by demolishing his statue, liberating the prisoners of the Inquisition, and scattering its papers. Paul's want of political wisdom, and his ignorance of human nature aroused antagonisms fatal to the success of his cause.

See references under Paul III.; also Castaldo, *Vita del pontifice Paolo Quarto* (Modena, 1618); Ranke, *Popes* (Eng. trans. by Austin), i. 286 *seq.* (an excellent sketch); Ancel, *Disgrace et procès dès Caraffa* (1909); Riess, *Politik Pauls IV.* (1909).

PAUL V. (Camillo Borghese), successor of Leo XI., was born in Rome on Sept. 17, 1552, of a noble family. He studied in Perugia and Padua, became a canon lawyer and was vice-legate in Bologna. As a reward of a successful mission to Spain Clement VIII. made him cardinal (1596) and later vicar in Rome and inquisitor. Elevated to the papacy on May 16, 1605, his extreme conception of papal prerogative, his arrogance and obstinacy, his perverse insistence upon the theoretical and disregard of the actual, made strife inevitable. He provoked disputes with the Italian states over ecclesiastical rights. Savoy, Genoa, Tuscany and Naples, wishing to avoid a rupture, yielded; but Venice resisted. (*See* SARPI, PAOLO.) The pope talked of coercion by arms; but Spain, to whom he looked for support, refused to be drawn into war, and the quarrel was finally settled by the mediation of France (March 22, 1607). Paul became involved in a quarrel with England over the new oath of allegiance required after the discovery of the Gunpowder Plot; and by his condemnation of Gallicanism (1613) he provoked the defiant declaration of the states general of 1614 that the king held his crown from God alone.

Paul encouraged missions, confirmed many new congregations and brotherhoods, authorized a new version of the Ritual and canonized Carlo Borromeo. His devotion to the interests of his family exceeded all bounds, and they became enormously wealthy. Paul began the famous Villa Borghese; enlarged the Quirinal and Vatican; completed the nave, façade and portico of St. Peter's; erected the Borghese Chapel in Sta. Maria Maggiore; and restored the aqueduct of Augustus and Trajan ("Acqua Paolina"). He also added to the Vatican library, and began a collection of antiquities. Paul died on Jan. 28, 1621, and was succeeded by Gregory XV.

See Bzovius (Bzowski), *De vita Pauli V.* (Rome, 1625; contained in Platina, *De vitis pontiff. rom.*, ed. 1626), who depicts Paul as a paragon of all public and private virtues; Vitorelli, continuator of Ciaconius, *Vitae et res gestae summorum pontiff. rom.* (a contemporary of the pope); Goujet, *Hist. du pontificat de Paul V.*, (1765); and the biography in Herzog-Hauck, *Realencyklopädie.*

PAUL I. (1754–1801), emperor of Russia, was born in the Summer Palace in St. Petersburg on Oct. 1 (N.S.), 1754. He was the son of the grand duchess, afterwards empress, Catherine. Scandal said that his father was not her husband the grand duke Peter, afterwards emperor, but one Colonel Soltykov. There is probably no foundation for this story except gossip, and the cynical malice of Catherine. During his infancy he was taken from the care of his mother by the empress Elizabeth, whose ill-judged fondness is believed to have injured his health. Catherine's dissolute court was a bad home for a boy, but Catherine took great trouble to arrange his first marriage with Wilhelmina of Darmstadt, who was renamed in Russia Nathalie Alexéevna, in 1773. She allowed him to attend the council to gain experience.

After his first marriage he began to engage in intrigues. He suspected his mother of intending to kill him, and once openly accused her of causing broken glass to be mingled with his food. Yet, though his mother removed him from the council and began to keep him at a distance, her actions were not unkind. The use made of his name by the rebel Pugachev in 1775 tended no doubt to render his position more difficult. When his wife died in childbirth in that year his mother arranged another marriage with the beautiful Sophia Dorothea of Württemberg, renamed in Russia Maria Feodorovna. Paul and his wife were allowed to travel through western Europe in 1781–1782. In 1783 the empress gave him an estate at Gatchina, where he maintained a brigade of soldiers whom he drilled on the Prussian model. As Paul grew his character became steadily degraded. He fell under the influence of two of his wife's maids of honour in succession, Nelidov and Lapuknin, and of his barber, a Turkish slave named Koroïssov. For some years before Catherine died it was obvious that he was hovering on the border of insanity.

Catherine contemplated setting him aside in favour of his son Alexander, to whom she was attached. No definite step was taken to set him aside, probably because nothing would be effective short of putting him to death, and Catherine shrank from the extreme course. The four and a half years (1796–1801) of Paul's rule in Russia were unquestionably the reign of a madman. (*See* RUSSIA: *History.*) His conduct of the foreign affairs of Russia plunged the country first into the second coalition against France in 1778, and then into the armed neutrality against Great Britain in 1801. His political follies might have been condoned had he not treated the people about him like a shah, or one

of the craziest of the Roman emperors. He began by repealing Catherine's law which exempted the free classes of the population of Russia from corporal punishment and mutilation. Nobody could feel himself safe from exile or brutal ill-treatment at any moment.

In Russia as in mediaeval Europe there was no safe prison for a deposed ruler. A conspiracy was organized by Counts Pahlen and Panin, and a half-Spanish, half-Neapolitan adventurer, Admiral Ribas; the death of Ribas delayed its execution. On the night of March 11, 1801, Paul was murdered in his bedroom in the St. Michael Palace. He was succeeded by his son, the emperor Alexander I., who was actually in the palace, and to whom Nicholas Zubov, one of the assassins, announced his accession.

See, for Paul's early life, K. Waliszewski, *Autour d'un trône* (Paris, 1894), or the English translation, *The Story of a Throne* (London, 1895), and P. Morane, *Paul I. de Russie avant l'avènement* (Paris, 1907). For his reign, T. Schiemann, *Geschichte Russlands unter Nikolaus I.* (Berlin, 1904), vol. i. and *Die Ermordung Pauls*, by the same author (Berlin, 1902).

PAUL-BONCOUR, JOSEPH (1873–), French politician, was born at St. Aignan on Aug. 4, 1873. After a brilliant university career, he joined the Paris bar. His book *Le fédéralisme économique*, published in 1900, showed him an ardent advocate of the trade union movement, and in 1906 he was elected to the Chamber as an independent Socialist, a follower of Painlevé, by his native district of Loire-et-Cher. In 1911 Paul-Boncour was appointed labour minister in the Radical Monis-Bertaux cabinet. In 1914 he held a command in Lorraine. Meanwhile, he had definitely joined the socialist party, thus fulfilling a promise made to Jaurès a few months before the latter's tragic end. He was returned to the Chamber at the November 1919 election and at once joined forces with Léon Blum in the struggle against the national Bloc. He was again returned in 1924, this time as deputy for Jaurès' former constituency of the Tarn. He was repeatedly a member of the French delegation to the Assembly of the League of Nations, and took an important part in the work of the League. He presided over the committee (Dec. 1925) appointed to report to the Council on the agenda for the disarmament conference. The role which he played in the League made him the object of attacks from many of the socialists, who reproached him with having been at Geneva the official delegate of a bourgeois government, and who tried to force on him the choice between this role and membership of the socialist party. Following the withdrawal of the support of the Radical-Socialist party from the government in 1928, Paul-Boncour resigned his appointment as French delegate to the League of Nations, but still remains a member of the Chamber.

PAULDING, JAMES KIRKE (1778–1860), American writer and politician, of Dutch descent, was born in what was formerly Dutchess (now Putnam) county (N. Y.), on Aug. 22, 1778. His father was ruined by pledging his fortune to secure supplies for the continental army. When about 18 Paulding moved to New York, secured a clerical position, and began writing anonymously for Peter Irving's paper, the *Morning Chronicle*. On Jan. 24, 1807, with William Irving, his brother-in-law, and with Washington Irving, he began the humorous series *Salmagundi*. The literary war with the English reviewers was continued in two clever satires, *The Diverting History of John Bull and Brother Jonathan* (1812) and *John Bull in America; or, The New Munchausen* (1825). One of his more serious books *The United States and England* (1815) attracted the notice of President Madison, who in 1815 appointed him secretary to the board of navy commissioners, a position he held until 1823. From 1824 to 1838 Paulding was navy agent in New York city and from 1838 to 1841 was secretary of the Navy in the cabinet of President Van Buren. In 1846 he purchased an estate near Hyde Park (N. Y.), where he lived till his death, April 6, 1860.

As early as 1824 Columbia college conferred on him the degree of Master of Arts for his literary work. Although the novel *Koningsmarke* (1823) and two narrative poems date from this early period—*The Lay of the Scottish Fiddle* (1813), a parody of Scott, and *The Backwoodsman* (1818)—most of his fiction was written later. His best-known novels include: *The Dutchman's Fireside* (1831); *Westward Ho!* (1832), a vivid tale of migration to the Mississippi valley; and *The Old Continental: or, The Price of Liberty* (1846). His *Life of Washington* (1835) was favourably reviewed by Poe and went through nine American editions before it was overshadowed by Irving's. The best of his plays, *The Lion of the West*, in 1830 won a prize offered by James Hackett for the best original comedy with an American as the leading character. His style, at its best, in ease and quiet irony, compares favourably with that of his friend Washington Irving.

See the *Literary Life of James K. Paulding* (1867), by his son, W. I. Paulding, which accompanied the edition of the father's work (1867–68); also the biography by A. L. Herold (1926), which contains a good bibliography.

PAULET, POULETT or POWLETT, an English family of an ancient Somersetshire stock, taking a surname from the parish of Pawlett near Bridgwater.

SIR AMIAS POULETT or Paulet (d. 1537), knighted in 1487 after the battle of Stoke, was treasurer of the Middle Temple in 1521, when Wolsey, in revenge for an indignity suffered at the knight's hands when the future chancellor was a young parson at Limington, forbade his leaving London without leave. To propitiate the cardinal, Sir Amias, rebuilding the Middle Temple gate, decorated it with the cardinal's arms and badge.

SIR AMIAS POULETT (1536–1588), is famous as the puritan guardian at Tutbury and Chartley of Mary, queen of Scots. After his prisoner's sentence at Fotheringhay, he beset Elizabeth's ministers with messages advising her execution, but he firmly withstood "with great grief and bitterness," the suggestion that she should be put to death secretly, saying that God and the law forbade.

SIR WILLIAM PAULET, marquess of Winchester, a member of a younger branch of the family, received many honours from Henry VIII. in return for his services against the Pilgrimage of Grace. The king's death found him lord president of the council and one of the executors of the famous will of the sovereign. The fall of the protector Somerset gave him the lord treasurership and a patent of the earldom of Wiltshire. He shared the advancement of Northumberland and was created in 1551 marquess of Winchester, but, although he delivered the crown jewels to the Lady Jane in 1553, he was with the lords at Baynard Castle who proclaimed Queen Mary. Only his death in 1572 drove from office this tenacious treasurer.

His princely house at Basing was held for King Charles by JOHN, the FIFTH MARQUESS OF WINCHESTER, whose diamond had scratched "Aimez Loyauté" upon every pane of its windows. The cavalier marquess died in 1675, unrecompensed, and his son CHARLES, a morose extravagant, had the dukedom of Bolton in 1689 for his desertion of the Stuart cause.

CHARLES, SECOND DUKE OF BOLTON (1661–1722), was made lord-lieutenant of Ireland in 1717. A third CHARLES, the 3rd duke, is remembered as an opponent of Sir Robert Walpole and as the husband of Lavinia Fenton, the Polly Peachum of Gay's opera. The dukedom became extinct in 1794

PAULICIANS, an evangelical Christian Church spread over Asia Minor and Armenia from the 5th century onwards. The Armenian patriarch John IV. (*c.* 728) states that Nerses, his predecessor, had chastised the sect, but ineffectually; and that after his death (*c.* 554) they had continued to lurk in Armenia. An anonymous account was written perhaps as early as 840, and incorporated in the Greek *Chronicon* of Georgius Monachus. It was also used by Photius (*c.* 867), bk. i., chs. 1–10 of his *Historia Manicheorum*, who, having held an inquisition of Paulicians in Constantinople was able to supplement it with a few additional details; and by Petrus Siculus (*c.* 868), who visited the Paulician fortress Tephrike to treat for the release of Byzantine prisoners. His *History of the Manicheans* is dedicated to the archbishop of Bulgaria, whither the Paulicians were sending missionaries.

The Paulicians were, according to the *Chronicon*, Manicheans, and were called after Paul of Samosata (*q.v.*). One Constantine, however, of Mananali, a canton on the western Euphrates, was regarded by the Paulicians as their real founder. He based his teaching on the Gospels and the Epistles of Paul, repudiating

other scriptures; and taking the Pauline name of Silvanus, began to organize churches, whose numbers soon increased. From the few facts and dates supplied by Photius and Petrus Siculus it may be inferred that with the exception of a period early in the ninth century (when Sergius, the greatest of their leaders, carried on a powerful missionary propaganda) they were in conflict, frequently armed conflict, with the Byzantine Empire until the 10th century. Nevertheless the movement spread in Bulgaria and then revived and became stronger than ever in Armenia. The crusaders found them everywhere in Syria and Palestine, and corrupted their name to Publicani, under which name, often absurdly conjoined with Sadducaei, we find them during the ages following the crusades scattered all over Europe. After 1200 we can find no trace of them in Armenian writers until the 18th century, when they reappear in their old haunts. In 1828 a colony of them settled in Russian Armenia, bringing with them a book called the *Key of Truth,* which contains their rites of name-giving, baptism and election, compiled from old mss., we know not when.

Doctrine.—On Paulician beliefs we have mainly hostile evidence, which needs sifting. The *Chronicon* source gives these particulars:—

1. They anathematized Mani, yet were dualists and affirmed two principles—one the heavenly Father, who rules not this world but the world to come; the other an evil demiurge, lord and god of this world, who made all flesh. The good god created angels only. The Byzantines erred in confusing these principles.

2. They denied the virgin birth of Jesus, and allegorized the Virgin as the upper Jerusalem in which the Lord came in and went out and denying that he was really made flesh of her.

3. They allegorized the Eucharist and explained away the bread and wine of which Jesus said to His apostles, "Take, eat and drink," as mere words of Christ, and denied that we ought to offer bread and wine as a sacrifice. Such allegorization meets us already in Origen, Eusebius and other early fathers, and is quite compatible with that use of a material Eucharist which Nerses II. attests among the Paulicians of the early 6th century, and for which the *Key of Truth* provides a form.

4. They assailed the cross, saying that Christ is a cross, and that we ought not to worship the tree, because it is a cursed instrument. John IV. and other Armenian writers report the same, and add that they smashed up crosses when they could.

5. They repudiated Peter, calling him a denier of Christ, and would not accept his repentance and tears. The *Key of Truth,* however, merely warns us that *all* the apostles constitute the Church universal and not Peter alone.

6. The monkish garb was revealed by Satan to Peter at the baptism, when it was the devil, the ruler of this world, who, so costumed, leaned forward and said, "This is my beloved son."

7. They called their meetings the Catholic Church, and the places they met in places of prayer, προσευχαί. The Armenian Paulicians equally denied the name of church to buildings of wood or stone, and called themselves the Catholic Church.

8. They explained away baptism as "words of the Holy Gospel," citing the text "I am the living water." So the Armenians taught that the baptismal water of the Church was "mere bath-water," *i.e.,* they denied it the character of a reserved sacrament. But there is no evidence that they eschewed water-baptism.

9. They permitted external conformity with the dominant Church, and held that Christ would forgive it.

10. They rejected the orders of the Church, had only two grades of clergy, namely, associate itinerants (συνέκδημοι, Acts xix. 29) and copyists (νοτάριοι), and scorned priestly vestments.

11. Their canon included only the "Gospel and Apostle."

13. Their Christology was as follows: "God out of love for mankind called up an angel and communicated to him his desire and counsel; then he bade him go down to earth and be born of woman. . . . And he bestowed on the angel so commissioned the title of Son, and foretold for him insults, blasphemies, sufferings and crucifixion. Then the angel undertook to do what was enjoined, but God added to the sufferings also death." However, the angel, on hearing of the resurrection, cast away fear and accepted death as well; and came down and was born of Mary, and named himself son of God according to the grace given him from God; and he fulfilled all the command, and was crucified and buried, rose again and was taken up into heaven. Christ was only a creature (κτίσμα), and obtained the title of Christ the Son of God by way of grace and remuneration for obedience.

The scheme of salvation here set forth recurs among the Latin Cathars. It resembles that of the *Key of Truth,* in so far as Jesus is Christ and Son of God by way of grace and reward for faithful fulfilment of God's command. But the *Key* lays more stress on the baptism. In this scheme the Baptism occupies the same place which the Birth does in the other, but both are adoptionist. The Armenian fathers held that Jesus, unlike other men, possessed incorruptible flesh, made of ethereal fire, and so far they shared the main heresy of the Paulicians. In many of their homilies Christ's baptism is also regarded as his regeneration by water and spirit, and this view goes beyond the modest adoptionism set forth in the *Key of Truth.* Certain features of Paulicianism noted by Photius and Petrus Siculus are omitted in the *Chronicon* source. One of these is the Christhood of the fully initiated, who as such ceased to be mere "hearers" (*audientes*) and themselves became vehicles of the Holy Spirit. As Jesus anointed by the Spirit became the Christ, so they became christs. Hence their opponents spoke of their "self-conferred priesthood" and "anthropolatrous apostacy," "calling themselves christs."

Because they regarded their Perfect or Elect ones as Christs and anointed with the Spirit, the mediaeval Cathars regularly adored them. So it was with Celtic saints, and Adamnan, in his life of St. Columba, i. 37, tells how the brethren after listening to St. Baithene, "still kneeling, with joy unspeakable, and with hands spread out to heaven, venerated Christ in the holy and blessed man." So in ch. 44 of the same book we read how a humble stranger "worshipped Christ in the holy man" (*i.e.,* St. Columba); but such veneration was due to every presbyter. The Christ is an elect one, who, as the Cathars put it, having been consoled or become a Paraclete in the flesh, stands in prayer with his hands outspread in the form of a cross, while the congregation of hearers or *audientes* adore the Christ in him. It was because they believed themselves to have living christs among them that the Paulicians rejected the fetish worship of a material cross, in which orthodox Armenian priests imagined they had by prayers and anointings confined the Spirit of Christ.

The later Cathars of Europe repudiated marriage on the ground that the only true marriage is of Christ with his bride the Virgin church, and perhaps this is why Paulicians and Thonraki would not make of marriage a religious rite or sacrament. The Cathars adhere to adult baptism, which in ancient wise they confer at thirty years of age or later, and have retained in its primitive significance the rite of giving a Christian name to a child on the eighth day.

PAULINUS, SAINT, of NOLA (353–431). Pontius Meropius Anicius Paulinus, who was successively a consul, a monk and a bishop, was born at Bordeaux in A.D. 353. His father, *praefectus praetorio* in Gaul, was a man of great wealth, who entrusted his son's education, with the best of results, to Ausonius. In 378 Paulinus was raised to the rank of *consul suffectus,* and in the following year he appears to have been sent as *consularis* into Campania. It was at this period, while present at a festival of St. Felix of Nola, that he entered upon his lifelong devotion to the cult of that saint. He had married a wealthy Spanish lady named Therasia; this happy union was clouded by the death in infancy of their only child. From Campania Paulinus returned to his native place and came into correspondence or personal

intimacy with Martin of Tours and Ambrose of Milan, and ultimately (about 389) he was formally received into the church by bishop Delphinus of Bordeaux, whence shortly afterwards he withdrew with his wife beyond the Pyrenees. The asceticism of Paulinus and his liberality towards the poor soon brought him into great repute; and while he was spending Christmas at Barcelona the people insisted on his being forthwith ordained to the priesthood. In the following year he went into Italy, and after visiting Ambrose at Milan and Siricius at Rome, he settled at Nola among the rude structures which he had caused to be built around the tomb and relics of his patron saint. With Therasia (now a sister, not a wife), while leading a life of rigid asceticism, he devoted the whole of his vast wealth to charity and to public works of utility or ornament; besides building basilicas at Fondi and Nola, he provided the latter place with a much-needed aqueduct. Not later than 409, he became bishop of Nola, an office he held until his death in 431. His feast-day is June 22.

The extant writings of Paulinus consist of some fifty *Epistolae*, addressed to Sulpicius Severus, Delphinus, Augustine, Jerome and others; thirty-two *Carmina* in a great variety of metre, including a series of hexameter "natales," begun about 393 and continued annually in honour of the festival of St. Felix, metrical epistles to Ausonius and Gestidius, and paraphrases of three psalms; and a *Passio S. Genesii*.

His works were edited by Rosweyde and Fronton le Duc in 1622 (Antwerp, 8vo), and their text was reprinted in the *Bibl. max. patr.* (1677). The next editor was Le Brun des Marettes (2 vols. 4to, Paris, 1685), whose text was reproduced in substance by Muratori (Verona, 1736), and reprinted by Migne. The poems and letters are edited in the Vienna *Corpus script. eccl. lat.* vol. xxviii. *See* also P. Reinelt, *Studien über die Briefe d. h. Paulin von Nola* Breslau, 1904.

PAULINUS (d. 644), first bishop of the Northumbrians and archbishop of York, was sent to England by Pope Gregory I. in 601 to assist Augustine in his mission. He was consecrated by Justus of Canterbury in 625 and escorted Æthelberg, daughter of Æthelberht, to the Northumbrian king Edwin (*q.v.*). In 627 Edwin was baptized and assigned York to Paulinus as his see. It was at Lincoln that he consecrated Honorius as archbishop of Canterbury. In 633 Edwin was slain at Hatfield Chase and Paulinus retired to Kent, where he became bishop of Rochester. He received the pallium in 634 and died in 644.

See Bede, *Historia ecclesiastica* (ed. C. Plummer, Oxford, 1896).

PAUL OF SAMOSATA, patriarch of Antioch (260–272), was, if we may credit the encyclical letter of his ecclesiastical opponents preserved in Eusebius's *History*, bk. vii. ch. 30, of humble origin. The letter just mentioned is the only indisputably contemporary document concerning him and was addressed to Dionysius and Maximus, respectively bishops of Rome and Alexandria, by seventy bishops, priests and deacons, who attended a synod at Antioch in 269 and deposed Paul. Their sentence, however, did not take effect until late in 272, when the emperor Aurelian, having defeated Zenobia and anxious to impose upon Syria the dogmatic system fashionable in Rome, deposed Paul and allowed the rival candidate Domnus to take his place.

Paul held that it was a man and not the divine Logos which was born of Mary. Jesus was a man who came to be God, rather than God become man. Paul's Christology therefore was of the Adoptionist type, which we find among the primitive Ebionite Christians of Judaea, in Hermas, Theodotus and Artemon of Rome, and in Archelaus the opponent of Mani, and in the other great doctors of the Syrian Church of the 4th and 5th centuries. Lucian the great exegete of Antioch and his school derived their inspiration from Paul, and he was through Lucian a forefather of Arianism. Probably the Paulicians of Armenia continued his tradition, and hence their name. (*See* PAULICIANS.)

Paul of Samosata represented the high-water mark of Christian speculation; and it is deplorable that the fanaticism of his own and of succeeding generations has left us nothing but a few scattered fragments of his writings. Already at the Council of Nicaea in 325 the Pauliani were put outside the Church and condemned to be rebaptized. It is interesting to note that at the synod of Antioch the use of the word *consubstantial* to denote the relation of God the Father to the divine Son or Logos was condemned, although it afterwards became at the Council of Nicaea the watchword of the orthodox faction.

PAULSBORO, a borough of Gloucester county, New Jersey, U.S.A., on the Delaware river and the Pennsylvania railroad, 12 m. S.W. of Camden and Philadelphia. Pop. (1920) 4,352; 1928 local estimate 7,500. It has a large oil refinery and various other manufacturing industries. The borough was incorporated in 1904.

PAULSEN, FRIEDRICH (1846–1908), German philosopher and educationalist, was born at Langenhorn (Schleswig) and educated at Erlangen, Bonn and Berlin, where he became extraordinary professor of philosophy and pedagogy in 1878. In 1896 he succeeded Eduard Zeller as professor of moral philosophy at Berlin. He died on Aug. 14, 1908. He was the greatest of the pupils of G. T. Fechner, to whose doctrine of panpsychism he gave great prominence by his *Einleitung in die Philosophie* (1892; Eng. trans., 1895). He attempted to give an epistemological account of our knowledge of the psycho-physical. Admitting Kant's hypothesis that by inner sense we are conscious of mental states only, he holds that this consciousness constitutes a knowledge of the "thing-in-itself"—which Kant denies. Soul is, therefore, a practical reality which Paulsen, with Schopenhauer, regards as known by the act of "will." But this "will" is neither rational desire, unconscious irrational will, nor conscious intelligent will, but an instinct, a "will to live" (*Zielstrebigkeit*), often subconscious, pursuing ends, indeed, but without reasoning as to means. This conception of will, though consistent and convenient to the main thesis, must be rigidly distinguished from the ordinary significance of will, *i.e.*, rational desire. Paulsen is almost better known for his educational writings than as a pure philosopher. His *German Education, Past and Present* (Eng. trans., by I. Lorenz, 1907) is a work of great value.

PAULUS, surnamed SILENTIARIUS ("The silentiary," one of the imperial ushers), Greek poet, contemporary and friend of Agathias, during the reign of Justinian. In addition to some 80 epigrams, preserved in the Greek Anthology, there is extant by him a description of the church of St. Sophia. The poem was recited at the second dedication of the church (A.D. 562), in the episcopal hall of the patriarchate. The poems are of importance for the history of Byzantine art in the 6th century.

BIBLIOGRAPHY.—Ed. of the poems on St. Sophia, by I. Bekker in the Bonn *Corpus scriptorum hist. byz.* (1837), including the descriptions of the church by Du Cange and Banduri, and in J. P. Migne, *Patrologia graeca*, lxxxvi.; metrical translations, with commentary, by C. W. Kortum (1854), and J. J. Kreutzer (1875); *see* also Merian-Genast, *De Paulo Silentiario* (Leipzig, 1889) and B. L. Gildersleeve in *Amer. Journ. of Philol.* vol. xxxviii. (1917).

PAULUS (older form PAULLUS), **LUCIUS AEMILIUS,** surnamed MACEDONICUS (*c.* 229–160 B.C.), Roman general, a member of a patrician family of the Aemilian gens, son of the consul of the same name who fell at Cannae. Consul for the second time in 168, he finished off the Macedonian War at Pydna (June 22), and with the help of 10 commissioners organized the country as a Roman province. The captive king Perseus was shown at his triumph. Paulus was censor in 164, and died in 160 after a long illness. At the funeral games exhibited in his honour the *Hecyra* of Terence was acted for the second and the *Adelphi* for the first time. An aristocrat to the backbone, he was yet beloved by the people. Of the vast sums brought by him into the Roman treasury from Spain and Macedonia he kept nothing to himself, and at his death his property scarcely sufficed to pay his wife's dowry. As a general he was a strict disciplinarian.

See Plutarch, *Aemilius Paulus;* Livy xliv. 17–xlvi. 41; Polybius xxix.–xxxii.

PAULUS DIACONUS, or **WARNEFRIDI,** or **CASINENSIS** (*c.* 720–*c.* 800), the historian of the Lombards, belonged to a noble Lombard family and flourished in the 8th century. An ancestor named Leupichis entered Italy in the train of Alboin and received lands at or near Forum Iulii (Friuli). During an invasion

the Avars swept off the five sons of this warrior into Illyria, but one, his namesake, returned to Italy and restored the ruined fortunes of his house. The grandson of the younger Leupichis was Warnefrid, who by his wife Theodelinda became the father of Paulus. Born between 720 and 725, Paulus received an exceptionally good education, probably at the court of the Lombard king Ratchis in Pavia, learning from a teacher named Flavian the rudiments of Greek. It is probable that he was secretary to the Lombard king Desiderius, the successor of Ratchis; it is certain that this king's daughter Adelperga was his pupil. After Adelperga had married Arichis, duke of Benevento, Paulus at her request wrote his continuation of Eutropius. It is possible that he took refuge at Benevento when Pavia was taken by Charlemagne in 774, but it is much more likely that his residence there was anterior to this event by several years. Soon he entered a monastery on the lake of Como, and before 782 he had become an inmate of the great Benedictine house of Monte Cassino, where he made the acquaintance of Charlemagne. About 776 his brother Arichis had been carried as a prisoner to France, and when five years later the Frankish king visited Rome, Paulus successfully wrote to him on behalf of the captive. His literary attainments attracted the notice of Charlemagne, and Paulus became a potent factor in the Carolingian renaissance. In 787 he returned to Italy, where he died between 794 and 800.

The chief work of Paulus is his *Historia gentis Langobardorum*. This incomplete history in six books was written after 787 and deals with the story of the Lombards from 568 to the death of King Liutprand in 747. The story is told from the point of view of a Lombard patriot and is especially valuable for the relations between the Franks and the Lombards. Paulus used the document called the *Origo gentis Langobardorum*, the *Liber pontificalis*, the lost history of Secundus of Trent, and the lost annals of Benevento; he made a free use of Bede, Gregory of Tours and Isidore of Seville. His *Historia romana* continues the *Breviarium* of Eutropius from 364 to 553.

Paulus wrote at the request of Angilram, bishop of Metz (d. 791), a history of the bishops of Metz to 766, the first work of its kind north of the Alps. This *Gesta episcoporum mettensium* is published in Bd. ii. of the *Monumenta Germaniae historica Scriptores*, and has been translated into German (Leipzig, 1880). He also wrote many letters, verses and epitaphs: *see* Karl Neff, *Die Gedichte des Paulus Diaconus* (Munich, 1908).

Of the *Historia* there are about a hundred manuscripts extant. It was largely used by subsequent writers, was often continued, and was first printed in Paris in 1514. It has been translated into English, German, French and Italian, the English translation being by W. D. Foulke (Philadelphia, 1807), and the German by O. Abel and R. Jacobi (Leipzig, 1878). Among the editions of the Latin the best is that edited by L. Bethmann and G. Waitz, in the *Monumenta Germaniae historica. Scriptores rerum langobardicarum* (Hanover, 1878). The *Historia romana* was edited by H. Droysen and published in the *Monumenta Germaniae historica. Auctores antiquissimi*, Bd. ii. (1879).

See C. Cipolla, *Note bibliografiche circa l'odierna condizione degli studi critici sul testo delle opere di Paolo Diacono* (Venice, 1901).

PAUMOTU (TUAMOTU or LOW ARCHIPELAGO): *see* PACIFIC ISLANDS.

PAUNCEFOTE, JULIAN PAUNCEFOTE, 1ST BARON (1828–1902), English diplomatist, third son of Robert Pauncefote of Preston Court, Gloucestershire, was born on Sept. 13, 1828. He was educated at Marlborough, Paris and Geneva, and called to the bar at the Inner Temple in 1852. He was for a short time secretary to Sir William Molesworth, secretary for the colonies, and then held colonial appointments at Hongkong and in the East Indies until 1874. He was then legal adviser to the colonial office, and afterwards to the foreign office, of which he became permanent under-secretary in 1882. In 1885 he was one of the delegates to the Suez Canal international commission, and received the G.C.M.G. and the K.C.B. Salisbury sent him as British minister at Washington in 1889. He did much during his term of office to maintain friendly relations between the two countries, especially during the Venezuelan crisis. The Bering Sea fishery dispute (1890–1892) was successfully negotiated by him; he arranged a draft treaty for Anglo-American arbitration, and the revision of the Clayton-Bulwer Treaty on the subject of the Panama Canal. He died at Washington, May 26, 1902.

PAUPER. In the particular and technical sense in which it is commonly used in Britain, pauper means a person in receipt of poor law relief, either for himself or for his dependants. In order to get this relief it is necessary to be not merely poor, but destitute, *i.e.*, without material resources directly available and appropriate for satisfying physical needs, whether actually existing or likely to arise in the immediate future. The relief given may be either "indoor," *e.g.*, maintenance in a workhouse, hospital, infirmary, asylum, or poor law school, or "outdoor" in the form of allowances in money or kind, or of medical attendance in the home. Pauperism formerly involved disfranchisement. This was slightly modified in 1885 by the Medical Relief Disqualification Removal Act, which provided that a man who received medical relief only should not lose his vote, save for the election of boards of guardians. In 1918 the Representation of the People Act swept away the "pauper disqualification" generally. It left two restrictions, however. Regular inmates of poor law institutions cannot be voters, because residence in such institutions does not qualify them for inclusion in the electoral register. And the recipient of any form of poor law relief is ineligible for election as a member of a board of guardians or of a district council.

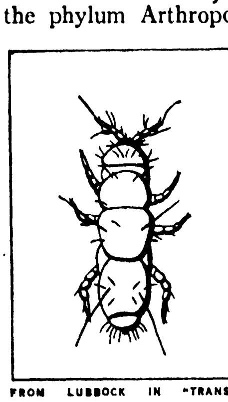
PAUROPUS HUXLEYI, SHOWING ADULT SPECIMEN FROM ABOVE (GREATLY MAGNIFIED)

The following table shows the total number of paupers in England and Wales on Jan. 1, and in Scotland on Jan. 15, in certain years:

Year	Paupers (England and Wales)	Paupers (Scotland)
1870	1,084,821	138,683 (May 14)
1880	837,940	105,411
1890	793,246	95,040
1900	807,471	99,932
1913	794,227	108,292
1923	1,537,990	271,858
1928	1,236,000	240,580

It should be noted that these figures represent the numbers in receipt of relief on a single day. The number of individuals who become paupers during the course of the year would be much larger. Thus the total on Jan. 1, 1907, in England and Wales was slightly under 800,000; but the year's count showed a total of 1,700,000. (*See* POOR LAW.) (C. M. L.)

PAUROPODA, a class of minute soil-dwelling animals of the phylum Arthropoda, it forms with Diplopoda (Millipedes, *q.v.*) and Symphyla (*q.v.*) the superclass Progoneata in which the openings of the reproductive system are near the front of the body, in contrast with those of the Opisthogoneata (Centipedes and Insects) in which the reproductive system opens at the hinder end of the body.



FROM LUBBOCK IN "TRANSACTIONS"

YOUNG PAUROPUS WITH ONLY 3 PAIRS OF LEGS (GREATLY MAGNIFIED)

The white body has a distinct head with one pair of highly characteristic antennae and an elongated trunk bearing nine pairs of simple, jointed legs and many tactile hairs. Each antennae consists of a basal part of four segments from the last of which spring two slenderer branches. True eyes are absent. Respiratory and blood systems are unknown, otherwise the internal anatomy is typically arthropodan in spite of the complexity of the male reproductive system.

When Lubbock discovered *Pauropus huxleyi,* which is only a millimetre and a half long, he gave a very true description of it

as "a bustling, active, neat and cleanly little creature" but the "look of cheerful intelligence" which he ascribed to it must be taken with a grain of salt. *Eurypauropus* is much more slothful.

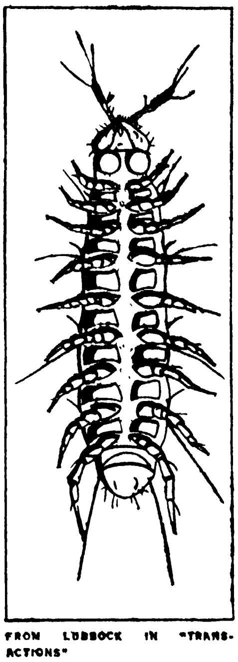
The class comprises two families: PAUROPIDAE and EURYPAUROPIDAE.

The female lays eggs and the young are hatched with three pairs of legs.

Pauropoda are widely distributed. Fossil forms are unknown, but detailed study of the body structures reveals considerable racial specialization. The poorly chitinized mouth-parts are indicative of a diet of soft tissues.

See C. Attems *Pauropoda in Handbuch der Zoologie*, Vol. 4, (1926).

(S. G. B.-B.)



FROM LUBBOCK IN "TRANSACTIONS"

PAUROPUS HUXLEYI, SEEN FROM BELOW (GREATLY MAGNIFIED)

PAUSANIAS (5th century B.C.), Spartan regent and commander, of the Agiad family, son of Cleombrotus. He succeeded his father as regent for Pleistarchus, the son of Leonidas, in 479 B.C. He first distinguished himself as commander of the combined Greek forces in the victory of the Plataea (*q.v.*). In 478 he was appointed admiral of the Greek fleet, and succeeded in reducing the greater part of Cyprus, the strategic key of the Levant, and in capturing Byzantium from the Persians, thus securing the command of the Bosporus. But he entered into treacherous negotiations with the Persian king, and alienated the Greek forces by adopting oriental clothes, and the haughtiness and inaccessibility of a Persian commander. Pausanias was recalled by the ephors and, though acquitted on the charge of Medism, was not again sent out officially. He returned, however, and seized Hermione and Sestos, but was dislodged by the Athenians. For some time he lived at Cleonae in the Troad, carrying on negotiations with Xerxes, but was again recalled to Sparta, where he incited the helots to revolt. When his schemes were almost matured, the evidence of a confidential slave led to the discovery of his plot by the ephors. He fled to the sanctuary of Athena Chalcioecus on the Spartan Acropolis; there he was starved to death. The date is probably 471–470 B.C.

See Herodotus v. 32, ix. 10–88; Thucydides i. 94–96, 128–134, ii. 71, 72, iii. 58; Diodorus Siculus xi. 30–47, 54; Cornelius Nepos, *Pausanias;* Justin ii. 15, ix. 1, 3; Pausanias iii. 4, 14, 17; Polyaenus viii. 51; Aristodemus ii., iv., vi.–viii.; Athenaeus xii. 535E, 536A; Plutarch, *Cimon* 6, *Themistocles* 23, *Aristides* 11–20, 23. (M. N. T.)

PAUSANIAS, Greek traveller and geographer of the 2nd century A.D., was probably a native of Lydia, and was possibly born at Magnesia ad Sipylum; he was certainly interested in Pergamum and familiar with the western coast of Asia Minor; but his travels extended far beyond the limits of Ionia. Before visiting Greece he had been to Antioch, Joppa and Jerusalem, and to the banks of the river Jordan. In Egypt he had seen the pyramids and had heard the music of the vocal Memnon, while at the temple of Ammon he had been shown the hymn once sent to that shrine by Pindar. He had taken note of the fortifications of Rhodes and Byzantium, had visited Thessaly, and had gazed on the rivulet of "blue water" beside the pass of Thermopylae. In Macedonia he had almost certainly viewed the traditional tomb of Orpheus, while in Epirus he was familiar with the oracular oak of Dodona, and with the streams of Acheron and Cocytus. Crossing over to Italy, he had seen something of the cities of Campania, and of the wonders of Rome.

His *Description of Greece* (περιήγησις τῆς Ἑλλάδος), takes the form of a tour in the Peloponnesus and in part of northern Greece. It is divided into ten books: (i.) Attica and Megara; (ii.) Argolis, including Mycenae, Tiryns and Epidaurus; (iii.) Laconia; (iv.) Messenia; (v.) and (vi.) Elis, including Olympia; (vii.) Achaea; (viii.) Arcadia; (ix.) Boeotia, and (x.) Phocis, including Delphi. Book i. was written after Herodes Atticus had built the Athenian Stadium (A.D. *c.* 143), but before he had built the Odeum (*c.* 160–161). This book was probably published some years before the rest. The statement in book v. (1, 2), that 217 years had elapsed since the restoration of Corinth (44 B.C.), shows that Pausanias was engaged on his account of Elis in A.D. 174, during the reign of Marcus Aurelius. He repeatedly refers to buildings erected by Hadrian, who died in A.D. 138. He had lived in that emperor's time. He mentions the wars of Antoninus Pius against the Moors, and of Marcus Aurelius (in and after A.D. 166) against the Germans (viii. 43). The latest event recorded is the incursion of the robber-horde of the Costobocs (A.D. *c.* 176; x. 34, 5).

The work has no formal preface or conclusion. It suddenly begins with the promontory of Sunium, and it ends abruptly with an anecdote of a blind man of Naupactus. The author's general aim may be inferred from his saying at the close of his account of Athens and Attica: "Such (in my opinion) are the *most famous* of the Athenian *traditions* and *sights;* from the mass of materials I have aimed from the outset at selecting the really *notable*" (i. 39, 3). It is possibly in the hope of giving variety and interest to the topographical details of Athens that the author intersperses them with lengthy historical disquisitions; but the result is that the modern reader is tempted to omit the "history" and to hasten on to the "topography," on which the author is now a primary authority. In the subsequent books he introduces two improvements. His account of each important city begins with a sketch of its history; and, in his subsequent descriptions, he adopts a strictly topographical order. He takes the nearest road from the frontier to the capital; he there makes for the central point, *e.g.*, the market-place, and describes in succession the several streets radiating from that centre. Similarly, in the surrounding district, he follows the principal roads in succession, returning to the capital in each case, until, at the end of the last road, he crosses the frontier for the next district.

In the later books he gives a few glimpses into the daily life of the inhabitants, ceremonial rites and superstitious customs. He frequently introduces narratives from history and of legend and folk-lore; and it is only rarely that he allows us to see something of the scenery. But, happily, he notices the pine-trees on the sandy coast of Elis, the deer and the wild boars in the oak-woods of Phelloë, and the crows amid the giant oak-trees of Alalcomenae. He tells us that "there is no fairer river than the Ladon," "no reeds grow so tall as those in the Boeotian Asopus," and the rain that deluges the fallow plain of Mantineia vanishes into a chasm to rise again elsewhere. It is mainly in the last three books that he touches on the products of nature.

He is inspired by a patriotic interest in the ancient glories of Greece. He is most at home in describing the religious art and architecture of Olympia and of Delphi; but, even in the most secluded regions of Greece, he is fascinated by all kinds of quaint and primitive images of the gods, by holy relics and many other sacred and mysterious things. He is interested in visiting the battlefields of Marathon and Plataea, and in viewing the Athenian trophy on the island of Salamis, the grave of Demosthenes at Calauria, of Leonidas at Sparta, of Epameinondas at Mantineia, and the colossal lion guarding the tomb of the Thebans on the Boeotian plain. At Thebes itself he views the shields of those who died at Leuctra, and the ruins of the house of Pindar; the statues of Hesiod and Arion, of Thamyris and Orpheus, in the grove of the Muses on Helicon; the portrait of Corinna at Tanagra, and of Polybius in the cities of Arcadia.

At Olympia he takes note of the ancient quoit of Iphitus inscribed with the terms of the Olympic truce, the tablets recording treaties between Athens and other Grecian states, the memorials of the victories of the Greeks at Plataea, of the Spartans at Tanagra, of the Messenians at Naupactus, and even those of Philip at Chaeroneia and of Mummius at Corinth. At Delphi, as he climbs the sacred way to the shrine of Apollo, he marks the trophies of the victories of the Athenians at Marathon and on the Eurymedon, of the united Greeks at Artemisium, Salamis and Plataea, of the Spartans at Aegospotami, of the Thebans at Leuctra, and the shields dedicated in memory of the repulse and

defeat of the Gauls at Delphi itself. At Athens, he sees pictures of historic battles, portraits of famous poets, orators, statesmen and philosophers, and inscriptions recording the laws of Solon; on the Acropolis, the trophy of the Persian wars, the great bronze statue of Athena, at the entrance to the harbour of the Peiraeus, the grave of Themistocles; and, outside the city, the monuments of Harmodius and Aristogeiton, of Cleisthenes and Pericles, of Conon and Timotheus, and of all the Athenians who fell in battle, except the heroes of Marathon, "for these, as a meed of valour, were buried on the field."

In the topographical part of his work, he is fond of digressions on the wonders of nature, the signs that herald the approach of an earthquake, the tides, the ice-bound seas of the north, and the noonday sun which at the summer solstice casts no shadow at Syene. He criticizes the myths and legends relating to the gods and heroes. He prefers the works of the 5th and 4th centuries B.C. to those of later times At Delphi he admires the pictures of Polygnotus, closing the seven chapters of his minute description with the appreciative phrase. "so varied and beautiful is the painting of the Thasian artist" (x. 31, 2). In sculpture his taste is no less severe. Even in the "uncouth" work of Daedalus, he recognizes "a touch of the divine" (ii. 4, 5). In architecture, he admires the prehistoric walls of Tiryns, and the "Treasury of Minyas," the Athenian Propylaea, the theatre of Epidaurus, the temples of Bassae and Tegea, the walls of Messene, the Odeum at Patrae, as well as the building of the same name lately built at Athens by Herodes Atticus (vii. 20, 6), and finally the Stadium which that munificent Athenian had faced with white marble from Pentelicus.

He has been well described by J. G Frazer as "a man made of common stuff and cast in a common mould, his intelligence and abilities seem to have been little above the average, his opinions not very different from those of his contemporaries." His literary style is "plain and unadorned yet heavy and laboured" (*Introduction*, pp. xlix., lxix).

In all parts of Greece the accuracy of his descriptions has been proved by the remains of the buildings which he describes; and a few unimportant mistakes, and some slight carelessness in copying inscriptions, do not lend any colour to an imputation of bad faith. His accurate notice of Mycenae led to its discovery by Schliemann. It has been stated with perfect justice by Frazer (p. xcv. *seq.*) that "without him the ruins of Greece would for the most part be a labyrinth without a clue, a riddle without an answer." For the possible extent of Pausanias's obligations to Polemon and other writers *see* the references below, especially those to the work of Frazer, Kalkmann and Gurlitt.

EDITIONS —Siebelis (Leipzig, 1822); Schubart and Walz (1838); Teubner texts, Schubart (1862), and Spiro (1903). Text, Latin translation and index, L. Dindorf (Didot, Paris, 1845); text and German commentary, Hitzig and Blumner, books i.–ix., already published in five parts (Leipzig, 1896–1907). Special edition of *Descriptio arcis Athenarum*, Otto Jahn (Bonn, 1860), 3rd ed, with maps and plans, etc., A Michaelis (1901). F. Imhoof-Blumer and Percy Gardner, "Numismatic Commentary on Pausanias," first published in *Journal of Hellenic Studies*, vi–viii. (1885–1887); J. G Frazer, *Pausanias's Description of Greece*, in six vols., introduction and translation (vol. i.), commentary (vols. ii–v), maps and index (vol. vi.) (Macmillan, London, 1898), introduction reprinted in Frazer's *Pausanias and other Greek Sketches* (1900).

SPECIAL LITERATURE —Wernicke, *De Pausaniae studiis herodoteis* (Berlin, 1884), Wilamowitz, "Thukydideslegende," in *Hermes* (1877), xii. 346; P. Hirt, *De fontibus Pausaniae in Eliacis* (Greifswald, 1878); A. Flasch, in Baumeister's *Denkmaler*, s v. "Olympia," 90 pp. (1887), A. Kalkmann, *Pausanias der Perieget* (Berlin, 1886), and in *Archaologischer Anzeiger* (1895), p. 12; opposed by W Gurlitt, *Über Pausanias* (Graz, 1890), 494 pp; Bencker, *Anteil der Periegese an der Kunstschriftstellerei* (1890), and R. Heberdey, *Die Reisen des Pausanias in Griechenland*, with two maps (Vienna, 1894).

The present writer is much indebted to Gurlitt's comprehensive monograph, and to the admirable Introduction prefixed to J. G. Frazer's excellent Translation and Commentary. *See* also C Robert, *Pausanias als Schriftsteller* (Berlin, 1909). (J. E SA.; X)

PAVIA (anc. *Ticinum*, *q.v.*), a town of Lombardy, Italy, capital of the province of Pavia, on the Ticino about 2 m. above its junction with the Po, 22½ m. S. of Milan by rail, 253 ft. above sea-level. Pop. (1921), 36,422 (town); 42,043 (commune). On the right bank of the river lies the suburb of Borgo Ticino connected with the town by a covered bridge (1351–54). The bastions have been transformed into boulevards and gardens.

Monuments.—The church of San Michele Maggiore, originally constructed under the Lombard kings, was burnt in 1004, and the present building dates from the latter part of the 11th and the first half of the 12th centuries, and was completed in 1155. The lower part of the façade is adorned with three fine portals and with reliefs in sandstone, and has arcading under the gable. The dome is octagonal. The interior is vaulted and has eight pillars and a mosaic pavement of the 12th or 13th centuries.

The cathedral of San Martino, begun in 1488 by Cristoforo Rocchi, is a vast "central" structure, unfinished until the dome and façade were completed in 1898 according to Rocchi's still extant model. The church of S. Pietro in Ciel d'Oro, which as it stands was consecrated in 1132, is very similar to S. Michele. The Lombard king Liutprand (711–744), whose bones were found in 1896, was buried here In 1923 the remains of Boethius were also placed here. The Arca di S. Agostino (after 1362) is a sumptuous tomb containing the relics of S. Augustine of Hippo.

The church of S. Maria del Carmine is externally one of the most beautiful brick Gothic churches in northern Italy. S. Francesco has a façade after that of Chiaravalle near Milan. The church of S. Maria di Canepanova with its small dome was designed by Bramante. Near it are three tall, slender brick towers of the Gothic period S Teodoro, with a 12th century exterior, has frescoes by Bartolommeo Suardi (Bramantino) after 1507. Outside the town lie the churches of S. Salvatore and of S. Lanfranco Beccari (d. 1189) (12th century) with the saint's tomb by Giovanni Antonio Amedeo (1447–1522), a native of Pavia.

The university was refounded by Galeazzo II. in 1361 on the site of a law school probably founded by Lanfranc, afterwards archbishop of Canterbury (d 1089), though we find Pavia a centre of study as early as A.D. 825, and it duly celebrated its 1100th anniversary in 1925. The present imposing building was begun by Lodovico il Moro in 1490. In the library are preserved some of the ashes of Columbus, who was a student here. Volta made here his first electrical experiments. For poor students there are two colleges, the Borromeo and the Ghislieri founded by S. Carlo Borromeo (1563) and Pope Pius V. (1569).

Pavia has iron-foundries and artificial silk and other factories. It is also an important agricultural centre It lies on the main line from Milan to Genoa (which crosses the Po by a bridge half a mile long), with several branch lines Barges pass down the Po to the Adriatic or to Milan by canal Five miles N. of Pavia is the Carthusian monastery of Certosa di Pavia, one of the most magnificent in the world Its founder Gian Galeazzo Visconti laid the first stone in August 1396, and the nave was then begun in the Gothic style, but was not completed until 1465 The rest of the church with its external arcaded galleries and lofty pinnacles (including the fine dome) and the cloisters were executed in the Renaissance style under Guiniforte Solari (1453–81) with details in terra-cotta of great beauty and richness. Giovanni Antonio Amedeo was chief architect in 1481–99, and the lower part of the façade was finished in 1507. It is perhaps the finest piece of elaborate and richly adorned Renaissance architecture in existence. In the south transept of the church is the tomb of the founder In the north transept is the tomb of Lodovico Sforza, il Moro and his wife by Cristoforo Solari. An elegant portal leads into the small cloister; the terra-cotta ornaments surmounting the slender marble pillars are the work of Rinaldo de Stauris (1463–78), who executed similar decorations in the great cloister. This cloister is 412 ft. long by 334 ft. wide and contains 24 cells of the monks, little three-roomed houses each with its own garden Within the confines of the monastery is the Palazzo Ducale which since 1901 has been occupied by the Certosa museum.

History.—For earlier period *see* TICINUM. By the conquest of Pavia and the capture of Desiderius in 774 Charlemagne completely destroyed the Lombard supremacy. It was then the centre of the Carolingian power in Italy, and a royal residence was built in the neighbourhood (Corteolona on the Olona) It was in San Michele Maggiore that Berengar of Friuli, and his successors down to Berengar II. and Adalbert II, were crowned "kings

of Italy." Under the reign of the first the city was sacked and burned by the Hungarians. At Pavia was celebrated in 951 the marriage of Otto I. and Adelheid (Adelaide). Laid in ruins by Henry II., who was attacked by the citizens on the night after his coronation in 1004, it none the less closed its gates on Conrad the Salic in 1026.

The jealousy between Pavia and Milan having in 1056 broken out into open war, Pavia had recourse to the emperors, and for the most part she remained attached to the Ghibelline party till the latter part of the 14th century. From 1360, when Galeazzo was appointed imperial vicar by Charles IV., Pavia became practically a possession of the Visconti family and in due course formed part of the duchy of Milan. For its insurrection against the French garrison in 1499 it paid the penalty in 1500. Having been strongly fortified by Charles V., the city was in 1525 able to bid defiance to Francis I., but two years later the French under Lautrec sacked it. In 1655 Prince Thomas of Savoy vainly besieged Pavia with an army of 20,000 Frenchmen.

The Austrians under Prince Eugène occupied it in 1706, the French in 1733 and the French and Spaniards in 1743; and the Austrians were again in possession from 1746 till 1796, when it was seized by Napoleon. The revolutionary movement of February 1848 was crushed by the Austrians who held it until 1859.

See C. Dell' Acqua, *Guida illustrata di Pavia* (Pavia, 1900), and refs. there given; L. Beltrami, *La Chartreuse de Pavie* (Milan, 1899); *Storia documentata della Certosa di Pavia* (Milan, 1896). (T. A.)

Battle of Pavia (1525).—In 1524 Francis I. of France, at the head of some 30,000 men, moved into Italy, took Milan and lay siege to Pavia. This city was hard-pressed when Lannoy, Charles V.'s viceroy of Naples, marched to its relief at the head of a numerically slightly inferior force. On Feb. 25, 1525, an attempt was made to join hands with the garrison, but Francis so skilfully deployed his artillery that he took the Spanish attacking column in flank, and drove it back in confusion. Imagining the victory to be his, he set out in pursuit, only to be met by an epoch-making tactical surprise which ended in the destruction of his army, and the capture of himself.

One of Lannoy's generals was the Marquis de Pescaire, a man of genius. He had under his command 1,500 Spanish arquebusiers, and having grasped the true value of the fire-arm had instructed them "without word of command . . . to wheel round, to face about from this side to that, now here, now there, with the utmost rapidity" (Brantôme). When the French cavalry charged they were met by this novel system of defence which threw them into complete confusion. Meanwhile the advance of the French cavalry and infantry had masked their guns, and whilst Francis was held in front by the arquebusiers, Antonio de Leyva, at the head of his garrison, made a sortie from Pavia and fell on his rear. As the battle of Ravenna (1512) marks the advent of artillery as the weapon of demoralization, so does that of Pavia mark the superiority of hand firearms over lance and pike. In spite of the lessons of Alfonso d'Este at the first and of Pescaire at the second, it took many years of bloodshed before European armies grasped their meaning.

PAVIA Y ALBUQUERQUE, MANUEL (1828–1895), Spanish general, born at Cadiz, Aug. 2, 1828. Lieutenant in 1846, captain in 1855, and major in 1862, he joined the staff of Marshal Prim in 1865, shared in the unsuccessful revolutionary movements of 1866, and after two years of exile, in the successful revolution of 1868. After the abdication of Amadeus, Pavia put down the Carlists and the chief cantonal insurrections of the south. He hoped to realize with Castelar a dictatorial, military, and political republic which would rally round its standard all the most conservative groups. The plan was interrupted by the military *pronunciamiento* for the purpose of dissolving the Cortes of 1873. On Jan. 3, 1874, Pavia made his *coup d'état;* master of the situation after the *pronunciamiento* but free from personal ambition, he sent for Serrano to form a Government with Conservatives and Radicals of the revolution. He died on Jan. 4, 1895.

PAVLOV, IVAN PETROVICH (1849–), Russian physiologist, was born on Sept. 14 (old style), 1849, in the district of Ryazan in Russia, son of the village priest. He studied science at the university and then medicine at the military medical academy of St. Petersburg (Leningrad). He graduated as a doctor in 1883, and in 1884 was appointed *privat-dozent* in physiology, but he went for two years to Germany to work under Ludwig and Heidenhain. In 1890 Pavlov was appointed director of the physiological department of the institute of experimental medicine at St. Petersburg and in 1897 professor at the medical academy. In 1907 he was elected member of the Russian academy of sciences. He is famous for his research on the problems of digestion, and on cerebral activity and the theory of reflexes. His first achievements were on the physiology of blood circulation. He devised special methods of treating animals, which enabled him to make observations under normal conditions of the organism. His first papers appeared in 1878–79. From 1892–97 a series of papers on the physiology of digestion was published in the *Archives des Sciences Biologiques.* In 1897 a collected account was published in German and French, *Die Arbeit der Verdauungsdrüsen.* (Eng. trans., *The Work of the Digestive Glands,* 1902.) For this important work he was awarded the Nobel prize in 1904. Most of his and his pupils' researches are published in Russian. In 1907 Pavlov was elected a foreign member of the Royal Society and in 1915 he was awarded the Copley medal. Since the war, as director of the physiological laboratories in the Russian Academy of Medicine and the Institute of Experimental Medicine, he has added to his fame. In 1928, on the occasion of the Harvey tercentenary, he was made an honorary fellow of the Royal College of Physicians in London. Many of his lectures and treatises have been translated into English by Professor Anrep, of Cambridge. *See* M. Dontchef-Dezeuze, *L'Image et les Réflexes Conditionnels dans les travaux de Pavlov* (1914) and *Conditioned Reflexes, an investigation of the physiological activities of the Cerebral Cortex* (Oxford, 1927).

PAVLOVA, ANNA (1885–), Russian dancer, was born in St. Petersburg (Leningrad) on Jan. 31, 1885. At the age of 10 she entered the Imperial Ballet School, attached to the Mariinski Theatre, St. Petersburg, and subsequently became prima ballerina of this theatre. She later appeared at the Imperial Opera House in St. Petersburg, and in 1910 made her first visit to England. Assisted by Michael Mordkin she appeared at the Palace theatre, London, in "Le Cygne," "Les Papillons" and "Valse Caprice." In the same year she appeared in Paris with Diaghilev's Russian ballet in "Les Sylphides," "Pavillon d'Armide" and "La Nuit Egyptienne"; and also in New York in the ballet "Coppelia." Later, after making regular appearances in London for some years at the Palace theatre, she toured in the United States, winning much admiration for her original dance creations, especially those in the classical style.

PAVLOVO, a town of Russia in the Nizhegorod province, on the Oka river, in 55° 58′ N., 43° 5′ E. Pop. (1926) 16,258. Since the 17th century it has been famous for its cutlery, hardware and locksmith trade, carried on in Pavlovo itself and the neighbouring villages, in cottages and small workshops. A factory has recently been established in the town, which has a museum of cutlery models.

PAWHUSKA, a city of north-eastern Oklahoma, U.S.A., at the foot of the Osage hills; the county-seat of Osage county. It has a municipal airport and is served by the Midland Valley and the Santa Fe railways. The population was 6,414 in 1920 (88% native white) and was estimated locally at over 10,000 in 1928. It is the seat of the Osage Indian Agency and a government boarding-school for Indian girls, and a trading centre for the Osage Nation (numbering 2,229 headrights) who have received $157,367,400 (1920–28) from lease-sales of their oil-lands, besides royalties amounting to about $16,000,000 a year, and are the richest people (*per caput*) in the world. The city is also the metropolis for cotton and stock-raisers and for oil-prospectors. The Osage Agency was established here in 1872. The name (meaning "white-hair") was that of a famous and respected Osage chief. In 1906 the site was selected and surveyed for one of the five towns to be

established in the Osage Nation, as provided by the federal Allotment Act; a lot-sale was held which realized $25,000 for the Indians; and the city was incorporated. By 1928 it was a well built city, with substantial business buildings, a beautiful residence district "on the hill," established schools and churches and public utilities, a municipal hospital, a library, an assessed valuation of $7,280,312, several manufacturing industries, banks with deposits aggregating $5,676,258 on Aug. 1928, and a council-manager form of government (adopted 1921).

PAWNBROKING is the business of lending money on the security of goods taken in pledge. If we desire to trace with minuteness the history of pawnbroking we must go back to the earliest ages of the world, since the business of lending money on portable security (*see* MONEY-LENDING, and USURY) is one of the most ancient of human occupations.

In China the pawnshop was probably as familiar two or three thousand years ago as it is to-day, and at all events down to the outbreak of the long period of successive civil wars which began in the first quarter of the present century its conduct was still regulated quite as strictly as in England. The Chinese conditions, too, were decidedly favourable to the borrower. He might, as a rule, take three years to redeem his property, and he could not be charged a higher rate than 3% per annum—a regulation which would close every pawnshop in England in a month. Both Rome and Greece were as familiar with the operation of pawning as the modern poor all the world over; indeed, from the Roman jurisprudence most of the contemporary law on the subject is derived.

The Pledge System.—It was, indeed, in Italy, and in more modern times, that the pledge system which is now almost universal on the continent of Europe arose. In its origin that system was purely benevolent, the early *monts de piété* established by the authority of the popes lending money to the poor only, without interest, on the sole condition of the advances being covered by the value of the pledges. Thus as early as 1198 something of this nature was started at Freising in Bavaria; while in 1350 a similar endeavour was made at Salins in Franche Comté, where interest at the rate of 7½% was charged. Nor was England backward, for in 1361 Michael Northbury, or de Northborough, bishop of London, bequeathed 1,000 silver marks for the establishment of a free pawnshop. These primitive efforts, like the later Italian ones, all failed. The Vatican was therefore constrained to allow the Sacri monti di pietà to charge sufficient interest to their customers to enable them to defray expenses. Thereupon a learned and tedious controversy arose upon the lawfulness of charging interest, which was only finally set at rest by Pope Leo X., who, in the tenth sitting of the Council of the Lateran, declared that the pawnshop was a lawful and valuable institution, and threatened with excommunication those who should presume to express doubts on the subject. The Council of Trent inferentially confirmed this decision.

Italian Monti di Pietà.—Long before this, however, monti di pietà charging interest for their loans had become common in Italy. The date of their establishment was not later than 1464, when the earliest of which there appears to be any record in that country—it was at Orvieto—was confirmed by Pius II. Three years later another was opened at Perugia by the efforts of two Franciscans, Barnabus Interamnensis and Fortunatus de Copolis. They collected the necessary capital by preaching, and the Perugian pawnshop was opened with such success that there was a substantial balance of profit at the end of the first year. The Dominicans endeavoured to preach down the "lending-house," but without avail. Viterbo obtained one in 1469, and Sixtus IV. confirmed another to his native town of Savona in 1479. After the death of Brother Barnabus in 1474 a strong impulse was given to the creation of these establishments by the preaching of another Franciscan, Father Bernandino di Feltre, who was in due course canonized. By his efforts monti di pietà were opened at Assisi, Mantua, Parma, Padua, Pavia and elsewhere. From Italy the pawnshop spread gradually all over Europe. Augsburg adopted the system in 1591, Nuremberg copied the Augsburg regulations in 1618, and by 1622 it was established at Amsterdam, Brussels, Antwerp and Ghent. Madrid followed suit in 1705, when a priest opened a charitable pawnshop with a capital of fivepence.

Introduction in France.—The institution was, however, very slow in obtaining a footing in France. It was adopted at Avignon in 1577, and at Arras in 1624. The doctors of the once powerful Sorbonne could not reconcile themselves to the lawfulness of interest, and when a pawnshop was opened in Paris in 1626, it had to be closed within a year. Then it was that Jean Boucher published his *Défense des monts de piété*. Marseilles obtained one in 1695; but it was not until 1777 that the first mont de piété was founded in Paris by royal patent. The statistics which have been preserved relative to the business done in the first few years of its existence show that in the twelve years between 1777 and the Revolution, the average value of the pledges was 42 fr. 50, which is well above the present average. The interest charged was 10% per annum, and large profits were made upon the sixteen million livres that were lent every year. The National Assembly, in an evil moment, destroyed the monopoly of the mont de piété, but it struggled on until 1795, when the competition of the money-lenders compelled it to close its doors. So great, however, were the extortions of the usurers that the people began to clamour for its reopening, and in July 1797 it recommenced business with a fund of £20,000 founded by five private capitalists. At first it charged interest at the rate of 36% per annum, which was gradually reduced, the gradations being 30, 24, 18, 15, and finally 12% in 1804. In 1806 it fell to 9%, and in 1887 to 7%. In 1806 Napoleon I. re-established its monopoly, while Napoleon III., as prince-president, regulated it by new laws that are still in force. In Paris the pledge-shop is, in effect, a department of the administration; in the French provinces it is a municipal monopoly; and this is generally true throughout the continent of Europe.

In Great Britain.—In England the pawnbroker, like so many other distinguished personages, "came in with the Conqueror." From that time, indeed, to the famous legislation of Edward I., the Jew moneylender was the only pawnbroker. Yet, despite the valuable services which the class rendered, not infrequently to the Crown itself, the usurer was treated with studied cruelty—Sir Walter Scott's Isaac of York was no mere creation of fiction. These barbarities, by diminishing the number of Jews in the country, had, long before Edward's decree of banishment, begun to make it worth the while of the Lombard merchants to settle in England. It is now as well established as anything of the kind can be that the three golden balls, which have for so long been the trade sign of the pawnbroker, were the symbol which these Lombard merchants hung up in front of their houses, and not, as has often been suggested, the arms of the Medici family. In 1338 Edward III. pawned his jewels to the Lombards to raise money for his war with France. Henry V. did much the same in 1415.

The Lombards were not popular, and Henry VII. harried them a good deal. In the very first year of James I. "An Act against Brokers" was passed and remained on the statute-book until 1872. It was aimed at "counterfeit brokers," of whom there were then many in London. This type of broker was evidently regarded as a mere receiver of stolen goods, for the act provided that "no sale or pawn of any stolen jewels, plate or other goods to any pawnbroker in London, Westminster or Southwark shall alter the property therein," and that "pawnbrokers refusing to produce goods to their owner from whom stolen shall forfeit double the value."

Throughout both the 17th and 18th centuries the general suspicion of the pawnbroker appears to have been only too well founded. It would appear from the references Fielding makes to the subject in *Amelia*, which was written when George II. was on the throne, that, taken in the mass, he was not a very scrupulous tradesman. Down to about that time it had been customary for publicans to lend money on pledges that their customers might have the means of drinking, but the practice was at last stopped by act of parliament. Nor was respect for the honesty of the business increased by the attempt of "The Charitable Corporation" to conduct pawnbroking on a large scale. Established by charter in 1707, "this nefarious corporation," as Smollett called it, was a swindle on a large scale. The directors gambled wildly with the shareholders' money, and in the end the common council of the city of London petitioned parliament for the dissolution of

this dishonest concern. When it collapsed in 1731 its cashier, George Robinson, M.P. for Marlow, and another principal official disappeared, less than £30,000 being left of a capital which had once been twenty times as much.

Modern English Regulations.—The pawnbroker's licence dates from 1785, the duty being fixed at £10 in London and £5 in the country; and at the same time the interest chargeable was settled at ½% per month, the duration of loans being confined to one year. Five years later the interest on advances over £2 and under £10 was raised to 15%. The modern history of legislation affecting pawnbroking begins, however, when the act of 1800 was passed, in great measure by the influence of Lord Eldon, who never made any secret of the fact that, when he was a young barrister without briefs, he had often been indebted to the timely aid of the pawnshop. The pawnbrokers were grateful, and for many years after Lord Eldon's death they continued to drink his health at their trade dinners. The measure increased the rate of interest to a halfpenny per half-crown per month, or fourpence in the pound per mensem—that is to say, 20% per annum. Loans were to be granted for a year, although pledges might be redeemed up to fifteen months, and the first week of the second month was not to count for interest. The act worked well, on the whole, for three-quarters of a century, but it was thrice found necessary to amend it. Thus in 1815 the licence duties were raised to £15 and £7, 10s. for London and the country respectively; another act of 1840 abolished the reward to the "common informer" for reporting illegal rates of interest; while in 1860 the pawnbroker was empowered to charge a halfpenny for the pawn-ticket when the loan was under five shillings. As time went on, however, the main provisions of the act of 1800 were found to be very irksome, and the Pawnbrokers' National Association and the Pawnbrokers' Defence Association worked hard to obtain a liberal revision of the law. It was argued that the usury laws had been abolished for the whole of the community with the single exception of the pawnbroker who advanced less than £10. The limitations of the act of 1800 interfered so considerably with the pawnbrokers' profits that, it was argued, they could not afford to lend money on bulky articles requiring extensive storage room. In 1870 the House of Commons appointed a Select Committee on Pawnbrokers, and it was stated in evidence that in the previous year 207,780,000 pledges were lodged, of which between thirty and forty millions were lodged in London. The average value of pledges appeared to be about 4s., and the proportion of articles pawned dishonestly was found to be only 1 in 14,000.

The result of the Select Committee was the Pawnbrokers Act of 1872, which repealed, altered and consolidated all previous legislation on the subject, and is still the measure which regulates the relations between the public and the "brokers of pawn." Based mainly upon the Irish law passed by the Union Parliament it put an end to the old irritating restrictions, and reduced the annual tax in London from £15 to the £7, 10s. paid in the provinces. By the provisions of the act (which does not affect loans above £10), a pledge is redeemable within one year, and seven days of grace added to the year. Pledges pawned for 10s. or under and not redeemed in time become the property of the pawnbroker, but pledges above 10s. are redeemable until sale, which must be by public auction. In addition to one halfpenny for the pawn-ticket, or one penny if the loan is over 10s., the pawnbroker is entitled to charge as interest one halfpenny per month on every 2s. or part of 2s. lent where the loan is under 40s., and on every 2s. 6d. where the loan is above 40s.; and since 1922 he has been allowed to charge in addition an extra halfpenny for each 5s. or part of 5s. lent. "Special contracts" may be made where the loan is above 40s. at a rate of interest agreed upon between lender and borrower. Unlawful pawning of goods not the property of the pawner, and taking in pawn any article from a person under the age of twelve, or intoxicated, or any linen, or apparel or unfinished goods or materials entrusted to wash, make up, etc., are, *inter alia*, made offences punishable by summary conviction.

Elaborate provisions are made to safeguard the interests of borrowers whose unredeemed pledges are sold under the act. Thus the sales by auction may take place only on the first Monday of January, April, July and October, and on the following days should one not be sufficient. This legislation was, no doubt, favourable to the pawnbroker rather than to the borrower. The annual interest on loans of 2s. had been increased by successive acts of parliament from the 6% at which it stood in 1784 to 25% in 1800, and to 27 in 1860—a rate which was continued by the measure of 1872. The annual interest upon a loan of half-a-crown is now 260%, as compared with 173 in 1860 and 86 in 1784; while the extreme point is reached in the case of a loan of 1s. for three days, in which case the interest is 1014% per annum.

Scotland and Ireland.—The growth of pawnbroking in Scotland, where the law as to pledge agrees generally with that of England, is remarkable. Early in the 19th century there was only one pawnbroker in that country, and in 1833 the number reached only 52. Even in 1865 there were no more than 312. In 1928 there were 238 in Edinburgh and Glasgow alone. In Ireland, as in the Free State and in Northern Ireland, the rates for loans are practically identical with those charged in England, but a penny is paid for any ticket. Articles pledged for less than £1 must be redeemed within six months, but nine months are allowed when the amount is between 30s. and £2. For sums over £2 the period is a year, as in England. In Ireland, too, a fraction of a month is calculated as a full month for purposes of interest, whereas in England, after the first month, fortnights are recognized. In 1838 there was an endeavour to establish monts de piété in Ireland, but the scheme was so unsuccessful that in 1841 the eight charitable pawnshops that had been opened had a total adverse balance of £5340. In 1847 three were left; eventually they also collapsed.

United States.—The pawnbroker in the United States is, generally speaking, subject to considerable legal restriction, but violations of the laws and ordinances are frequent. Each state has its own regulations, but those of New York and Massachusetts may be taken as fairly representative. "Brokers of pawn" are usually licensed by the mayors, or by the mayors and aldermen, but in Boston the police commissioners are the licensing authority. In the State of New York permits are renewable annually on payment of $500, and the pawnbroker must file a bond with the mayor, executed by himself and two responsible sureties, in the sum of $10,000. The business is conducted on much the same lines as in England, and the rate of interest is 3% per month for the first six months, and 2% monthly afterwards. Where, however, the loan exceeds $100 the rates are 2 and 1% respectively. To exact higher rates is a misdemeanour. Unredeemed pledges may be sold at the end of a year. Pawnbrokers are not allowed to engage in any kind of second-hand business. In the state of Massachusetts unredeemed pledges may be sold four months after the date of deposit. The licensing authority may fix the rate of interest, which may vary for different amounts, and in Boston every pawnbroker is bound to furnish to the police daily a list of the pledges taken in during the preceding 24 hours, specifying the hour of each transaction and the amount lent.

Municipal Pawnshops.—The fact that on the continent of Europe monts de piété are almost invariably either a state or a municipal monopoly necessarily places them upon an entirely different footing from the British pawnshop, but, compared with the English system, the foreign is often very elaborate and rather cumbersome. Moreover, in addition to being slow in its operation, it is, generally speaking, based upon the supposition that the borrower carries in his pockets "papers" testifying to his identity. On the other hand, it is argued that the English borrower of more than £2 is at the mercy of the pawnbroker in the matter of interest, that sum being the highest for which a legal limit of interest is fixed. The rate of interest upon a "special contract" may be, and often is, high. For the matter of that, indeed, this system of obtaining loans is always expensive, either in actual interest or in collateral disadvantages, whether the lender be a pawnbroker intent upon profit, or the official of a mont de piété. In France pawnshops are a municipal monopoly held in Paris by the Crédit Municipal and the head institution claims to be the greatest pawnshop in the world. Officially styled "Mont de Piété" it is popularly known as "ma tante," just as the pawnbroker in England is often called "my uncle." It is, however, something

more than a pawnshop and, in certain respects, fulfils some of the functions of a bank. The Crédit Municipal was founded by Louis XVI. and was opened in 1777, since which time it has been maintained by every successive government; Napoleon recognized it in 1804. By degrees the business increased so considerably that branches had to be opened in many quarters of Paris, and there are now twenty of them. Broadly speaking the Crédit Municipal lends on all marketable articles, and its customers are by no means limited to the poorer classes. The well-to-do, for example, when leaving Paris for the summer, often pawn their silver, the operation costing less than the hire of the necessary space in a safe deposit. The minimum loan is three francs. The habit of pawning clothes and wearing apparel is steadily decreasing, while the deposit of jewellery and other valuables is growing. The one tendency is due to the increased prosperity of the working classes; the other to the high cost of living. Advances are made for six months, and if they are not then repaid the loan may be renewed for a similar period. If at the end of a year the loan is neither repaid nor renewed, the pledge is sold, the borrower receiving the difference between the amount of the debt and the price obtained for the pawned article. The borrower may, however, repay by instalments. Rates of interest vary, but bank and Stock Exchange rates are followed as closely as possible and the average is about 7%. On pledges valued at more than 500 francs the interest is slightly higher than on those of smaller worth; on shares the rate is usually a little lower. Since 1919 traffic in pawn tickets has been forbidden. The law of July 25th, 1891, authorized the Crédit Municipal to lend money on stocks and bonds accepted or guaranteed by the Banque de France, such as Government and municipal issues. Loans on these paper securities are limited to 3,000 francs, but it is considered probable that the limit will presently be raised to 10,000 francs.

The profits of the Crédit Municipal are paid over to the "Assistance Publique," the comprehensive term used to indicate the body of charitable foundations. Originally this was the rule throughout France, but now many of the monts de piété are entirely independent of the charitable institutions. Provincial monts de piété can only be created by decree of the President of the Republic, with the consent of the local Conseil Communal; the mayor is the president. The administrative council is drawn one third each from the Conseil Communal, the governors of charitable societies and the townspeople. A large proportion of the capital required for conducting the institutions has to be raised by loan, while some part of the property they possess is the product of gifts and legacies. The amount to be advanced by a municipal pawnshop is fixed by an official called the *commissaire-priseur*, who is compelled to load the scales against the borrower, since, should the pledge remain unredeemed and be sold for less than was lent upon it, he has to make good the difference. This official is paid at the rate of ½% upon loans and renewals, and 3% on the amount obtained by the sales of forfeited pledges. The maximum and minimum that may be advanced are fixed. Somewhere between forty and fifty French towns possess municipal pawnshops, a few of which, like those of Grenoble and Montpellier, having been endowed, charge no interest.

Germany and Austria.—Pawnbroking in Germany is conducted at once by the state, by the municipalities, and by private enterprise; but of all these institutions the state loan office in Berlin is the most interesting. It dates from 1834, and the working capital was found, and still continues to be provided, by the Prussian State Bank. The profits are invested, and the interest devoted to charitable purposes. The maximum and minimum rates of interest are fixed, but the rate varies with the situation of the money market; the private pawnshops usually charge a higher rate than the state office. Two-thirds of the estimated value is the usual extent of a loan; four-fifths is advanced on silver, and five-sixths on fine gold. Before the inflation which followed the World War state and municipal bonds might be pledged up to a maximum of £150, the advance being 80% of the value, and a fixed interest of 6% was charged upon these securities. During and after the inflation securities could not be pledged; now, however, money is again being advanced upon state bonds.

The pawnbroking laws of Austria and Hungary are somewhat similar to those which prevail in England. Free trade exists, and the private trader has to obtain a government concession and deposit caution-money varying in amount from £80 to £800, according to the size of the town. He has, however, to compete with the monts de piété or Versatzaemer, which are sometimes municipal and sometimes state institutions. The chief of these is the imperial pawn office of Vienna, which was founded with charitable objects by the emperor Joseph I., in 1707, and one-half of the annual surplus has still to be paid over to the Vienna poor fund, though these payments are at present suspended. Here, as in Berlin, the profits are relatively small. Interest which, after the War, was very high, is calculated in fortnightly periods, however speedily redemption may follow upon pawning. Six months, with an additional period of six months, is the maximum period. The Hungarian state and municipal institutions appear, on the whole, to compete somewhat more successfully with the private firms than is the case in Vienna. The practice in Bohemia, Moravia and Silesia is still governed by the old Austrian law. In Czecho-Slovakia it conforms to the former Hungarian laws.

Italy.—In Italy, the "country of origin" of the mont de piété, the institution still flourishes. Four-fifths of the value is lent upon gold, one-half upon precious stones, and two-thirds upon other articles. The interest is 7% on all sums. The loans are of two types, one for a period of three months, the other for one year. A little less is lent if the owner of the pledge asks for a loan for a year. At every renewal the pledge is again estimated and if its value has diminished the debtor can choose between paying off the loan, having the object sold, or paying the difference between the first and the second estimate if he insists on a renewal. A fortnight must elapse after the day on which the payment is due before the pledge can be sold. The difference between the selling price and the sum lent goes to the owner. In addition to the interest the mont de piété retains 1% for the ticket, whatever the amount lent. The mont de piété's agencies retain an extra 2% on the loans. Private agencies have been suppressed.

Spain and Portugal.—The monts de piété in Spain have for a generation past been inseparably connected with the savings banks. We have already seen that the institution owes its origin in that country to the charitable exertions of a priest who charged no interest, and the system grew until in 1840, a century after his death, the mont de piété began to receive the sums deposited in the savings bank, which had just been established, for which it paid 5% interest. In 1869 the two institutions were united. This official pawnshop charges 6% upon advances which run for periods varying from six to twelve months, according to the nature of the article pledged, and a further month's grace is allowed before the pledges are sold by auction; 7% is usually lent upon jewellery. Private pawnbrokers are also very numerous, especially in Madrid; but their usual charges amount to about 60% per annum.

In Portugal the monte pio is an amalgamation of bank, benefit society and pawnshop. Its business consists chiefly in lending money upon marketable securities, but it also makes advances upon plate, jewellery and precious stones, and it employs officially licensed valuers. The rate of interest varies with the bank rate, which it slightly exceeds, and the amount advanced upon each article is about three-fourths of its certified value. There is in Portugal a second class of loan establishment answering exactly to the English pawnshop. The pawnbroker is compelled to deposit a sum, in acceptable securities, equal to the capital he proposes to embark, and the register of his transactions must be submitted quarterly to the chief of the police for examination.

Russia.—In the Union of Socialist Soviet Republics pawnshops are exclusively a state institution regulated by law and managed by the urban Soviets. The ordinary objects are accepted in pledge, but paper securities are barred. Articles may be pledged for a total period of fourteen months, but in the first place for four months only. There can then be a two months' renewal, followed by another of four months, with the right to a further prolongation of two months, with a final two months to complete the total permissible period. As much as 90% of their value may be lent

upon the precious metals, but not more than 75% upon other goods. The rate of interest is fixed by the urban Soviets, and ratified by the People's Commissar for Finance, and varies from town to town. In Moscow it is 1½% per month on pledges ranging in value from 1 to 15 roubles, 1¾% on those ranging from 15 to 25 roubles, and 2% for those of higher value.

Scandinavia.—Pawnbroking in Denmark has existed since 1688, but in 1753 the Royal Naval Hospital was granted the exclusive right to establish a "Royal Lombard" for advancing money on pledges, and was allowed to charge higher interest than the law permitted. The "Royal Lombard" still exists and does a very extensive business. The rate of interest is 1½% per month. The duration of a loan is three months, renewals being allowed. The old law was extended in 1867, when pawnbrokers were required to be licensed by the municipalities and to pay a small annual licensing fee. The rate of interest was such as might be agreed upon. The business is now regulated by a law of 1921 which applies both to the "Royal Lombard" and to private pawnbrokers, and limits the rate of interest. Up to Jan. 1st, 1926, the maximum rate of interest was 5% a month; from Jan. 1st, 1926, to Jan. 1st, 1936, it is fixed at a maximum of 4% a month, and from Jan. 1st, 1936, the maximum will be 1½% a month. During any of these periods a lower maximum rate of interest may, however, be fixed by the police in the various jurisdictions. All unredeemed pledges may eventually be sold by auction, though the loan may be renewed at any time before the sale. The Act of 1921, which also limits the granting of pawnbrokers' licences, will presumably result in the gradual disappearance of professional pawnbrokers, the greatly reduced rate of interest leaving but a small margin of profit.

In Sweden there are no special statutes affecting pawnbroking, with the exception of a proclamation by the Governor of Stockholm prohibiting the lending of money upon articles which may be suspected of having been stolen. Individuals still carry on the business on a small scale, but the bulk of it is now conducted by companies, which give general satisfaction. For many years there was in Stockholm a municipal establishment charging 10% for loans paid out of the city funds. The cost of administration was, however, so great that there was an annual loss upon its working, and the opportunity was taken to abolish it when, in 1880, a private company was formed called the "Pant Aktie Bank," to lend money on furniture and wearing apparel at the rate of 3 öre per krone a month, and 2 öre per krone a month on gold, silver and other valuables; a krone (nominal value, 1s. 1½d.) contains 100 öre. Some years later an opposition was started which charged only half these rates, with the result that the original enterprise reduced its interest to the same level, charging, however, 2 öre per krone per month for bulky articles—a figure which is now usual for pledges of that description. The money is lent for three months, and at the end of five months the pledge, if unredeemed, is sold by auction under prescribed conditions.

In Norway a police licence is required for lending money on pawn where the amount advanced does not exceed £4, 10s. Beyond that sum no licence is necessary, but the interest charged must not exceed such a rate as the king may decide.

Switzerland.—The fate of pawnbroking in Switzerland appears to be not very dissimilar from that of the Jew who is fabled to have once started in business at Aberdeen. Nevertheless the cantons of Bern and Zürich have elaborate laws for the regulation of the business. In both the broker must be licensed by the cantonal government, and the permit can be refused only when the applicant is "known to be a person undeserving of confidence." Regular books have to be kept, which must be at all times open to the inspection of the police, and not more than 2% interest per month may be charged upon loans up to 50 francs, 1½% between 50 and 300 francs, and 1% over 300 francs. A loan runs for six months, and unredeemed pledges may be sold by auction a month after the expiration of the fixed period, and then the sale must take place in the parish in which the article was pledged. The business is unprofitable owing to the low rate of interest, and in the cantons of Bern, Fribourg and Neuchâtel there are only two pawnbrokers. The Zürich cantonal bank, however, conducts a pawnbroking department, which lends nothing under 4s. or over £40 without the special sanction of the bank commission. Loans must not exceed two-thirds of the trade value of the pledge, but 80% may be lent upon the intrinsic value of gold and silver articles. The establishment makes practically no profit.

See C. L. Attenborough, *The Law of Pawnbroking* (1913; new edn., 1925); S. W. Levine, *The Business of Pawnbroking* (N.Y., 1913); F. Astier, *Des Monts-de-Piété en France* (Paris, 1913); L. Degani, *I Monti di Pietà* (Turin, 1916); Hetyer, *Das gegenwärtige öffentliche Leihaus in Deutschland* (Leipzig, 1907). (J. P. B.)

PAWNEE, an important Caddoan tribe, or group of four tribes—the Chaui, Kitkehahki, Pitahauerat and Skidi—formerly on Platte river, Nebraska. They were bison hunters, but also farmed, practised agricultural rites and lived in earth lodges. Their highest deity was Tirawa. Symbolism was developed in their religion, which included a star cult and a summer solstice sacrifice of a captive girl to the morning star. Their organization was primarily into villages; there are indications of matrilineal descent. They fought the Dakota, Cheyenne and other tribes, were friendly to the whites, but suffered at their hands through encroachment, disease and alcohol. In 1823 their chief village was burned by hostile Delawares. By treaty in 1833 they had ceded their territory south of the Platte, and in 1838 they surrendered all their remaining land except a strip on the Loup river. Here they lived until 1874, when they moved to the Oakland reservation in Indian Territory, now Oklahoma. They were formerly one of the most powerful of the plains tribes. Until nearly 1840, the population was 10,000; in 1849 it was 4,500; 1861, 3,400; 1879, 1,400; 1906, 600. *See* A. C. Fletcher, *Bur. Am. Ethn. Rep.* xxii. (1904).

PAWTUCKET, a city of Providence county, Rhode Island, U.S.A., on the Blackstone river (known here as the Pawtucket or the Seekonk), 4 m. N. of Providence and adjoining Central Falls. It is served by the New York, New Haven and Hartford railroad, motor-bus and truck lines and a steamboat line (for freight) to New York. Pop. (1920) 64,248 (33% foreign-born white, largely English, French-Canadians, Irish and Scots); 1928 local estimate 72,100. The city has an area of 8·6 sq.m., lying on both sides of the river, which in the heart of the business district makes a picturesque plunge of 50 ft. over a mass of rocks, providing good water-power. It is the second city of the State in size and in the value of its manufactures, which in 1925 amounted to $108,281,019. Textiles are the leading products. Almost every branch of cotton-manufacturing is represented, and there are many silk and rayon mills. Tennis racquets, machine tools and textile machinery are also distinctive products. The river has been improved by the Federal Government since 1867, until there is now a 16 ft. channel all the way to Narragansett bay; and the State has built a pier. The city's parks cover 242 ac., and its most conspicuous building is a fine new high school on the river-bank, built in 1926 at a cost of $1,700,000. The assessed valuation of property for 1927 was $135,231,540. The first settlement within the present city limits was made on the west side of the river about 1670 by Joseph Jenks, an iron worker, and the village became a centre of skilful and inventive ironmongers. In 1790 Samuel Slater found here the mechanical skill necessary to reproduce the Arkwright machinery for the manufacture of cotton goods. His mill (still standing) was the first successful factory of the kind in the United States. The part of Pawtucket which lies east of the river was originally in Massachusetts, and was transferred to Rhode Island in 1862; the part west of the river was annexed to Pawtucket from North Providence in 1874; and in 1885 the town was chartered as a city. The name is an Indian word meaning "fall of the waters."

PAX, the name given in ecclesiastical usage to a small panel or tablet decorated usually with a representation of the Crucifixion, which in the Roman ritual was kissed at the eucharistic service by the celebrating priest, then by the other clergy and the congregation. The use of the "pax" dates from the 13th century, and is said to have been first introduced in England in 1250 by Archbishop Walter of York. It took the place of the actual "kiss of peace" which was in the Roman Mass given by the bishop to the priests, and by them to the deacons and so to the laity, between

the consecration and communion, and which survives in symbolical form at High Mass. In the Greek Church the kiss (*εἰρήνη, ἀσπασμός*) takes place before the consecration, and now consists in the celebrant kissing the oblation and the deacon kissing his stole (*see* F. E. Brightman, *Liturgies Eastern and Western*, 1896). *See* the *Catholic Encyclopaedia, s.v.* "Pax."

PAXO [Paxos], one of the Ionian Islands (*q.v.*), about 8 m. S. of the south end of Corfu, is a hilly mass of limestone 5 m. long by 2 broad, and not more than 600 ft. high. Pop. *c.* 5,400. It produces excellent olive oil. Gaion (or, less correctly, Gaia), the principal village, lies on the E. coast, and has a small harbour. Towards the centre, on an eminence, stands Papandi, the residence of the bishop, and there are many churches with picturesque belfries. On the W. and S.W. coasts are remarkable caverns (Davy, *Ionian Islands*, i. 66–71). Ancient writers apply the plural form Paxi to Paxos and the smaller island now known as Antipaxo (Propaxos of the *Antonine Itinerary*). Paxos is the scene of the legend, in Plutarch's *De defectu oraculorum*, of the cry "Pan is dead." (*See* Pan.)

PAXTON, SIR JOSEPH (1801–1865), an English architect and ornamental gardener, who was born of humble parents at Milton Bryant, near Woburn, Bedfordshire, on Aug. 3, 1801. He was in 1823 employed in the arboretum at Chiswick, the seat of the duke of Devonshire, and eventually became superintendent of the duke's gardens and grounds at Chatsworth, and manager of his Derbyshire estates. In 1836 he began to erect a grand conservatory 300 ft. in length, which was finished in 1840, and formed the model for the Great Exhibition building of 1851. Perhaps Paxton's most interesting design was that for the mansion of Baron James de Rothschild at Ferrières in France, but he designed many other important buildings. He was M.P. for Coventry from 1854 until his death at Sydenham on June 8, 1865.

His works include: a *Practical Treatise on the Culture of the Dahlia* (1838), and a *Pocket Botanical Dictionary* (1st ed., 1840).

PAYA, a tribe of Indians living in north-eastern Honduras on the upper part of the Patuca river. Formerly they probably occupied the north coast from Trujillo to Cape Gracias. The linguistic relationship of the Paya tongue is uncertain; there is a tendency to regard the Payas, with their neighbours, the Jicaque, as the northern frontier of South American penetration in Central America.

See Karl Sapper, "Die Payas in Honduras," in *Globus,* bd. lxxv., Heft 2.

PAYMENT, the performance of an obligation, the discharge of a sum due in money or the equivalent of money. In law, in order that payment may extinguish the obligation it is necessary that it should be made at a proper time and place, in a proper manner, and by and to a proper person.

Payment may be made at any time of the day upon which it falls due, except in the case of mercantile contracts, where the creditor is not bound to wait for payment beyond the usual hours of mercantile business. If no place be fixed for payment, the debtor is bound to find, or to use reasonable means to find, the creditor, unless the latter be abroad. Payment must be made in money which is a legal tender, unless the creditor prefers to waive his right to payment in money by accepting some other mode of payment, as a negotiable instrument or a transfer of credit. If the payment be by negotiable instrument, the instrument may operate either as an absolute or as a conditional discharge. In the ordinary case of payment by cheque the creditor accepts the cheque conditionally upon its being honoured; if it be dishonoured, he is remitted to his original rights. If payment be made through the post, in a letter properly directed, and it be lost, the debt is discharged if there was a direction so to transmit the money. Payment must be made to the creditor or his agent. A *bona fide* payment to an apparent agent may be good, though he has in fact no authority to receive it. Such payment will usually be good where the authority of the agent has been countermanded without notice to the debtor. The fact of payment may be presumed, as from lapse of time. Thus payment of a testator's debts is generally presumed after 20 years. A written receipt (*q.v.*) is only presumptive and not conclusive evidence of payment. If payment be made under a mistake of fact, it may be recovered, but it is otherwise if it be made under a mistake of law, for it is a maxim of law that *ignorantia legis neminem excusat.* Money paid under compulsion of law, even though not due, cannot generally be recovered where there has been no fraud or extortion. For appropriation of payments *see* Appropriation.

Money may be paid into court to abide the result of pending litigation, as where litigation has already begun, as security for costs or as a defence or partial defence to a claim. Payment into court does not necessarily (except in actions for libel and slander) operate as an admission of liability. Money may sometimes be paid into court where no litigation is pending, as in the case of trustees. The payment of wages to labourers and workmen otherwise than in coin is prohibited. *See* under Labour Law: *Truck Acts.* Domestic or agricultural servants are excepted. *See* also Limitation, Statutes of.

Scotland.—The law of Scotland as to tender of payment agrees with that of England, except that Bank of England notes are not legal tender, and that part payment if accepted in full satisfaction extinguishes the whole debt. Scots laws, however, recognizes two presumptions in regard to payment. *Debitor non praesumitur donare,* an unascribed payment if accepted by the creditor must be imputed to account of the debt, but where there are several debts the creditor may choose which debt he will impute the payment to. *Donatio non praesumitur* is applied as meaning that where a stranger pays the debt he is presumed to have paid it with the debtor's money. Payment or satisfaction is also presumed from lapse of time, *i.e.*, (1) three years from the last entry in merchant's accounts, (2) five years from the tenant's removal in the case of rent, (3) six years in the case of bills, and (4) 20 years in the case of obligations contained in holograph writings. Where a debt is constituted by writ or is the result of a credit transaction, payment cannot be proved by witnesses.

United States.—In the United States the law as a rule does not materially differ from English law. In some States, however, money may be recovered, even when it has been paid under a mistake of law. The question of legal tender has been an important one. In 1862 and 1863 Congress passed acts making treasury notes legal tender (*see* Greenbacks). After much litigation, the Supreme Court of the United States decided in 1871 (*Knox* v. *Lee*) in favour of the constitutionality of these acts, both as to contracts made before and after they were passed. These notes are legal tender for all purposes except duties on imports and interest on the public debt. All gold coins and standard silver dollars are legal tender to any amount. Silver coins below the denomination of a dollar are legal tender up to $10, and cent and 5-cent pieces legal tender to an amount not exceeding 25 cents. It falls exclusively within the jurisdiction of Congress to declare paper or copper money a legal tender. By the constitution of the United States, "no State shall . . . make anything but gold and silver coin a tender in payment of debts" (art. i. s. 10).

A number of American States have by statute or decision departed from the general rule that a receipt in full is insufficient to make an agreed part payment discharge the entire debt. And it should be noted further that a certified check, though commonly accepted, is not legal tender. The most important present class of legal tender is the Federal Reserve note.

See I. Williston, *Contracts* § 120; R. Pound, 18 *Yale L. J.* 454.

PAYMENT BY RESULTS. A term used to describe various methods of wage remuneration in which some inducement is held out to the wage-earner to increase his pay by increased production. The simplest method is to pay a straight rate per piece, so that the worker draws remuneration in strict proportion to the number of units of output produced by him. Such payment per piece may be accompanied by an agreement to pay a minimum wage whatever the output.

The premium-bonus system is an interesting form of payment by results. The essence of this system is to fix by agreement between employer and employed a basis time for the completion of a definite unit of work. At the same time, the workman is guaranteed a time-rate of wage. If the worker accomplishes the unit of work in less than the basis time, he receives, over and

PAYN, JAMES (1830–1898), English novelist, was born at Cheltenham, on Feb. 28, 1830. He edited *Chambers's Journal* with much success for 15 years. He removed to London in 1861. In the pages of the *Journal* he published in 1864 his most popular story, *Lost Sir Massingberd*. Payn wrote some hundred novels, among the best known being *Carlyon's Year* (1868), *By Proxy* (1878), and *The Talk of the Town* (1885). In 1883 he succeeded Leslie Stephen as editor of the *Cornhill Magazine* and continued in the post until the breakdown of his health in 1896. He died in London, on March 25, 1898.

A biographical introduction to his *The Backwater of Life* was furnished by Sir Leslie Stephen.

PAYNE, JOHN HOWARD (1791–1852), American actor and playwright, was born in New York city, on June 9, 1791. When but 14 years of age, Payne established and edited *The Thespian Mirror*, of which 14 numbers were published. In 1806 he published *Julia*, his first play, which was performed at the Park theatre, New York city, the same year. On Feb. 24, 1809, also at the Park theatre, Payne made his début as an actor, playing the part of Norval in the tragedy of *Douglas*. His instant success in this rôle was followed by successes as Zaphno in *Mahomet*, Octavian in *The Mountaineers*, Salem in *Barbarossa*, Tancred in *Sigismonda* and Romeo in *Romeo and Juliet*. In 1813 he was engaged at the Drury Lane theatre in London. He remained in England or France for nearly 20 years as an actor and playwright. During his stay in Europe he wrote, translated, or adapted for the English stage more than 60 plays. For a time he was employed by the Drury Lane theatre to live in Paris and make translations and adaptations of French drama. In 1818 he wrote *Brutus*, which, produced at Drury Lane with Edmund Kean in the title rôle, ran for 50 nights. It speedily became a favourite in America and formed part of the regular repertoire of McCullough, Edwin Forrest and Edwin Booth In May 1823 his opera, *Clari; or the Maid of Milan*, was performed at the Covent Garden theatre, London. This is the opera in which his famous song *Home Sweet Home* appears, and it was first sung on that occasion by Ann Maria Tree. Washington Irving was Payne's constant friend and adviser while in England and aided him materially in writing the popular *Charles the Second*. Payne was the first American who as an actor or playwright attracted a great deal of attention in England He corresponded with Charles Lamb, and cherished an ardent but unrequited love for Mary Shelley. In 1832 Payne returned to America. He became interested in the Cherokee Indians with whom he lived for a time in the hut of John Ross, their famous chief. He espoused their cause against the Government in memorials and magazine articles, and collected their myths and traditions In 1842 President Tyler appointed him American consul at Tunis, Africa, but he was recalled in 1845. In 1851 he was reappointed to his old post. He died at Tunis on April 9, 1852.

Bibliographies of Payne's writings are found in *The Literary Collector* (Mar. 1905), and in the *Cambridge History of American Literature*, vol. i. (1917). *See* G. Harrison, *Life and Writings of John Howard Payne* (1875); C. H Brainard, *John Howard Payne* (1885); Bibliophile Society, *Romance of Mary W. Shelley, John Howard Payne and Washington Irving* (1907); W. T. Hanson, *Early Life of John Howard Payne* (1913).

PAYNE, PETER (*c.* 1380–1455), English Lollard and Taborite, the son of a Frenchman by an English wife, was born at Hough-on-the-Hill near Grantham, about 1380. He was educated at Oxford, where he adopted Lollard opinions, and had graduated as a master of arts before Oct. 6, 1406, when he was concerned in the irregular proceedings through which a letter declaring the sympathy of the university was addressed to the Bohemian reformers From 1410 to 1414 Payne was principal of St. Edmund Hall, and during these years was engaged in controversy with Thomas Netter of Walden, the Carmelite defender of Catholic doctrine. In 1414 he was compelled to leave Oxford and taught for a time in London.

Ultimately Payne took refuge in Bohemia, where he became a leader of the reformers at Prague. He joined the sect of the "Orphans," and had a prominent part in the discussions and conferences of the ten years from 1420 to 1430. Payne was one of the Bohemian delegates to the council of Prague. He arrived at Basel on Jan. 4, 1433, and his unyielding temper and bitter words probably did much to prevent a settlement. The Bohemians left Basel in April. The party of the nobles, who had been ready to make terms, were attacked in the Diet at Prague, by the Orphans and Taborites. Next year the dispute led to open war. The nobles were victorious at Lipau on May 29, 1434, and it was reported in England that Payne was killed. When soon afterwards the majority of the Orphans joined the moderate party, Payne allied himself with the more extreme Taborites. In Feb. 1437 the pope desired the emperor Sigismund to send Payne to be tried for heresy at Basel. Payne took refuge with Peter Chelcicky, the Bohemian author. Two years later he was captured and imprisoned at Gutenstein, but was ransomed by his Taborite friends. Payne took part in the conferences of the Bohemian parties in 1443–1444, and again in 1452. He died at Prague in 1455. Payne was also known as Clerk at Oxford, as Peter English in Bohemia, and as Freyng, after his French father, and Hough from his birth place.

Bibliography.—The chief facts of Payne's English career are given in the *Loci e libro veritatum* of T. Gascoigne (ed. Thorold Rogers, Oxford, 1881). For his later life the principal sources are contained in the *Monumenta conciliorum generalium saeculi v*, *Saeculi xv*, or *saeculi quintodecimi*, vols. i.–iii. (Vienna, 1857–1894). For modern authorities consult Palacky, *Geschichte von Bohmen*, vii.–ix., and Creighton's *History of the Papacy*. The biography by James Baker, *A Forgotten Great Englishman* (1894), is too partial.

PAYNTER (or Painter), **WILLIAM** (*c.* 1540–1594), English author, was a native of Kent He matriculated at St. John's college, Cambridge, in 1554. In 1561 he became clerk of the ordnance in the Tower of London, a position in which he appears to have amassed a fortune out of the public funds. In 1586 he confessed that he owed the government a thousand pounds, and in the next year further charges of peculation were brought against him. In 1591 his son Anthony owned that he and his father had abused their trust, but Paynter retained his office until his death. The first volume of his *Palace of Pleasure* appeared in 1566. It included 60 tales, and was followed in the next year by a second volume containing 34 new ones. A second improved edition in 1575 contained seven new stories Paynter borrows from Herodotus, Plutarch, Aulus Gellius, Aelian, Livy, Tacitus, Quintus Curtius; from Giraldi Cinthio, Matteo Bandello, Ser Giovanni Fiorentino, Straparola, Queen Margaret of Navarre and others. To the vogue of this and similar collections we owe the Italian setting of so large a proportion of the Elizabethan drama. The early tragedies of *Appius and Virginia*, and *Tancred and Gismund* were taken from *The Palace of Pleasure*; and among better-known plays derived from the book are the Shakespearian *Timon of Athens*, *All's Well that Ends Well* (from Giletta of Narbonne), Beaumont and Fletcher's *Triumph of Death* and Shirley's *Love's Cruelty*.

The Palace of Pleasure was edited by Joseph Haslewood in 1813. This edition was collated (1890) with the British Museum copy of 1575 by Mr. Joseph Jacobs, who added further prefatory matter, including an introduction dealing with the importance of Italian *novelle* in Elizabethan drama.

PAYSANDÚ, the second city of Uruguay in importance, capital of a department of the same name, is situated upon the east bank of the Uruguay river, about 214 m. N W. of Montevideo. Pop. (1928 estimate) 24,000. Growth is constant because of immigration and a favourable climate. The Uruguay river is navigable for steamers of 14 ft. draft and Paysandú has become an important port. Regular steamer communication is maintained with Buenos Aires and Montevideo. A railway connects with Montevideo toward the south-east, and another penetrates the northern country to the Brazilian frontier Paysandú is the centre of the meat packing and frozen meat industry of the republic, and also possesses breweries, sawmills, creameries, canning establishments, tanneries, flour mills, etc. It has a street car system, electric lights, a public library, theatre, two public markets, hospital, meteorological observatory. There are some good government buildings, and several bank and hotel buildings in modern style. The town was named in honour of Pay Sandú, a priest.

The department of Paysandú—area, 5,117 sq m.; pop. (1928 estimate) 90,523—is one of the richest stock-raising regions.

PAZ SOLDAN, MARIANO FELIPE (1821–1886), Peruvian historian and geographer, was born at Arequipa, on Aug 22, 1821. He studied law, and after holding some minor judicial offices, was minister to New Granada in 1853 In 1860 Castilla made him director of public works In 1861 he published his great atlas of the republic of Peru, and in 1868 the first volume of his history of Peru after the acquisition of her independence A second volume followed, and a third, bringing the history down to 1839, was published after his death by his son In 1870 he was minister of justice and worship under President Balta, but shortly afterwards retired from public life to devote himself to his great geographical dictionary of Peru, which was published in 1877 During the disastrous war with Chile he sought refuge at Buenos Aires, where he was made professor in the National college, and where he wrote and published a history of the war, *Historia de la Guerra del Pacifico* (1884) He died at Lima on Dec 31, 1886

PEA (*Pisum*), a genus of the family Leguminosae, consisting of herbs with compound pinnate leaves ending in tendrils, by means of which the weak stems are enabled to support themselves, and with large leafy stipules at the base The flowers are typically "papilionaceous" (*see* LEGUMINOSAE) with a "standard" or large petal above, two side petals or wings, and two front petals below forming the keel The stamens are ten—nine united, the tenth usually free or only slightly joined to the others This separation allows approach to the honey which is secreted at the base of the staminal tube The ovary is prolonged into a long, thick, bent style, compressed from side to side at the tip and fringed with hairs The fruit is a characteristic "legume" or pod, bursting when ripe into halves, which bear the large globular seeds (peas) on their edges These seeds are on short stalks, the upper extremity of which is dilated into a shallow cup (*aril*), the two seed-leaves (*cotyledons*) are thick and fleshy, with a radicle bent along their edges on one side

The genus is exceedingly close to *Lathyrus*, being only distinguished technically by the style, which in the latter genus is compressed from above downwards and not thick It is not surprising therefore, that under the general name "pea" species both of *Pisum* and of *Lathyrus* are included The common field pea with purple flowers, tan-coloured or compressed mottled seeds and two to four leaflets is *Pisum arvense*, which is cultivated in all temperate parts of the globe, but which according to the Italian botanists, is truly a native of central and southern Italy The garden pea, *P sativum*, which has white flowers, is more tender than the preceding, and its origin is not known, it has not been found in a wild state, and it is considered that it may be a form of *P arvense*, having, however, from four to six leaflets to each leaf and globular seeds of uniform colour

P sativum was known to Theophrastus and De Candolle (*Origin of Cultivated Plants*, p 329) points out that the word "pison" or its equivalent occurs in the Albanian tongue as well as in Latin, whence he concludes that the pea was known to the Aryans, and was perhaps brought by them into Greece and Italy Peas have been found in the Swiss lake-dwellings of the bronze period The garden peas differ considerably in size, shape of pod, degree of productiveness, form and colour of seed, etc The sugar peas are those in which the inner lining of the pod is very thin instead of being somewhat horny, so that the whole pod can be eaten Unlike most papilionaceous plants, peaflowers are self-pollinated The numerous varieties of peas in cultivation have been obtained by cross-fertilization, and also by selection Peas constitute a highly nutritious article of diet from the large quantity of nitrogenous materials they contain in addition to substantial amounts of starchy and saccharine matters

The sweet pea, cultivated for the beauty and fragrance of its flowers, is a species of the allied genus *Lathyrus* (*L odoratus*), a native of southern Europe The chick pea (*q v*) (*Cicer arietinum*), cultivated in many countries, is still farther removed from the true peas The everlasting pea of gardens is a species of *Lathyrus* (*L latifolius*) with very deep fleshy roots, bold foliage, and beautiful but scentless flowers

The field pea (*Pisum arvense*) is better adapted than the bean to light soils, and is best cultivated in rows of such a width as to admit of horse-hoeing The early stage at which the plants fall over, and forbid further culture, renders it even more needful than in the case of beans to sow them only on land already clean If annual weeds can be kept in check until the peas once get a close cover, they then occupy the ground so completely that nothing else can live under them, and the ground after their removal, is found in the choicest condition A thin crop of peas should never be allowed to stand, as the land is sure to become wholly overrun with weeds, these will completely choke the growth of the peas The difficulty of getting this crop well harvested renders it peculiarly advisable to sow only the early varieties

The pea prefers a friable calcareous loam deeply worked, and well enriched with good hotbed or farm-yard manure The early crops require a warm sheltered situation but the later are better grown 6 or 8 ft apart, or more, in the open quarters, dwarf crops being introduced between the rows The dwarf or early sorts may be sown 3 or 4 ft apart The deep working of the soil is of importance, lest the plants should suffer in hot dry weather from mildew or arrest of growth The first sowing may be made about the beginning or middle of November, in front of a south wall, the plants being defended by spruce fir branches or other spray throughout the winter In February sowings are sometimes made in private gardens, in flowerpots or boxes, and the young plants afterwards planted out The main crop should be sown towards the end of February, and moderate sowings should be made twice a month afterwards, up to the beginning of July for the north, and about the third week in July for warmer districts During dry hot weather late peas derive great benefit from mulching and watering The latest sowings at the middle or end of August, should consist of the best early sorts, as they are not so long in producing pods as the larger and finer sorts, and by this means the supply may be prolonged till October or November As they grow the earth is drawn up to the stems, which are also supported by stakes a practice which in a well-kept garden is always advisable, although it is said that the early varieties arrive sooner at maturity when recumbent

Peas grown late in autumn are subject to mildew, to obviate which it has been proposed to dig over the ground in the usual way and to soak the spaces to be occupied by the rows of peas thoroughly with water—the earth on each side to be then collected so as to form ridges 7 or 8 in high, these ridges being well watered, and the seed sown on them in single rows If dry weather at any time set in, water should be supplied profusely once a week

To produce very early crops the French market-gardeners used to sow early in November in frames, on a border having a good aspect, the seeds being covered very slightly The young plants are transplanted into other frames in December the ground inside being dug out so as to be 18 or 20 in below the sashes, and the earth thus removed placed against the outside of the frames The young plants, when 3 or 4 in high, are planted in patches of three or four 8 in asunder, in four longitudinal rows The sashes are covered at night with straw mats, and opened whenever the weather is sufficiently mild When 8 or 10 in high the stems are inclined towards the back of the frame, a little earth being drawn to their base, and when the plants come into blossom the tops are pinched out above the third or fourth flower to force them into bearing As soon as they begin to pod the soil may have a gentle watering, whenever sufficiently warmed by the sun but a too vigorous growth at an earlier period would be detrimental Thus treated the plants bear pods fit for gathering in the first fortnight in April

(V H B)

PEABODY, ELIZABETH PALMER (1804–1894), American educationist, was born at Billerica (Mass), on May 16, 1804 Educated at a small private school by her gifted mother, as were her sisters Sophia (Mrs Nathaniel Hawthorne) and Mary (Mrs Horace Mann), she began her own teaching at 16 Later she was assistant in A Bronson Alcott's famous Temple school, of which she published a *Record* (1835) Although overshadowed by Margaret Fuller, she was one of the leading feminine figures in the Transcendental movement, her West street book-

shop becoming a sort of club. She opened in Boston in 1860 the first kindergarten in America. In 1867 she went to Europe to study Froebel's methods at first hand, and thereafter through training classes, lectures, magazine contributions and her editing of the *Kindergarten Messenger* (1873–77) she spread the new theories. Her writing reflects her dominant interests. She died at Jamaica Plain, on Jan. 3, 1894.

See *Elizabeth Peabody,* a master's thesis from the University of Chicago, by Doris L. McCart (1918).

PEABODY, GEORGE (1795–1869), American philanthropist, was descended from an old yeoman family of Hertfordshire, England, named Pabody or Pebody. He was born in the part of Danvers which is now Peabody, Mass., on Feb. 18, 1795. After being apprenticed at a grocery store, he became assistant to his brother, and afterwards to his uncle, who had a business in Georgetown, District of Columbia. He served as a volunteer in the War of 1812, and afterwards became partner with Elisha Riggs in a dry goods store at Georgetown. Through his energy and skill the business increased with astounding rapidity, and, on the retirement of his partner about 1830, Peabody found himself at the head of one of the largest mercantile concerns in the world. About 1837 he established himself in London as merchant and money-broker at Wanford court, in the City, and in 1843 he withdrew from the American business.

Peabody gave £50,000 for educational purposes at Danvers; £200,000 to found and endow a scientific institute in Baltimore; various sums to Harvard university; £700,000 to the trustees of the Peabody Educational Fund to promote education in the southern States; and £500,000 for the erection of dwelling-houses for the working-classes in London. He received from Queen Victoria the offer of a baronetcy, but declined it. In 1867 the U.S. Congress awarded him a special vote of thanks. He died in London on Nov. 4, 1869; his body was carried to America in a British warship, and was buried in his native town.

See the *Life* (Boston, 1870) by Phebe A. Hanaford.

PEABODY, JOSEPHINE PRESTON (1874–1922), American poet, was born in Brooklyn, N.Y., in 1874, and educated at Radcliffe college. In 1898 she published *The Wayfarers: A Book of Verse.* Her later publications include *Fortune and Men's Eyes: New Poems with a Play* (1900); *Marlowe,* a drama (1901); *Pan: A Choric Idyl* (1904); *The Piper,* a play (1909); *The Singing Man* (1911); *The Wolf of Gubbio,* a play (1913); *Harvest Moon* (1916); *The Chameleon* (1917), and *Portrait of Mrs. W.,* a play (1922). *The Piper* won the Stratford-on-Avon prize and was produced at the Memorial theatre at Stratford in 1910. It was subsequently played in New York. Her plays are all poetic in form. She died at Cambridge, Mass., on Dec. 4, 1922.

See *Diary and Letters of Josephine Preston Peabody* (1925); *Collected Poems of Josephine Preston Peabody* (1927); and *Collected Plays of Josephine Preston Peabody* (1927).

PEABODY, a city of Essex county, Massachusetts, U.S.A., 13 m. N.E. of Boston; served by the Boston and Maine railroad. Pop. (1920) 19,552 (36% foreign-born white, largely from Greece, Ireland, Russia and Poland); 1928 local estimate 21,000. The city has an area of 17 sq. miles. Its factory output (principally leather, shoes, leather machinery and cotton goods) was valued in 1925 at $27,222,241. The area originally formed part of the town of Salem; then (1752) of the district and (1757) the town of Danvers. In 1855 it was separately incorporated as the town of South Danvers, and in 1868 the name was changed to honour George Peabody, the philanthropist, a native of the town. It was incorporated as a city in 1916.

PEACE, CHARLES (1832–1879), English criminal, was born at Darnley. He started his career as a Manchester portico robber, but in 1876 shot P. C. Cook, who attempted to capture him when burgling a house at Whalley Range. Though a man named Habron was sentenced for this (afterwards pardoned on Peace's confession) the police correctly ascribed to Peace the shooting of Arthur Dyson at Banner Cross in a quarrel over a woman. Peace then disappeared from police ken for years; he was in fact living in Evelina road, Peckham, as "Mr. Thompson, a gentleman of independent means," and at nights carried out the series of widespread burglaries which entirely baffled the police. He was arrested almost by accident on Blackheath, the police at first not knowing who he was, and hanged for the murder of Dyson in Feb. 1879. His plea that the killing was accidental in both cases was rejected, popular feeling being bitter against him. After his death he became a legendary figure, the wildest exploits being ascribed to him.

See *The Master Criminal, The Life Story of Charles Peace* (1910); R. W. Postgate, *Murder, Piracy and Treason* (1926).

PEACE, a river of western Canada. It rises in the Rocky mountains near 55° N., and breaking through the mountains, flows north-east into Slave river, near Lake Athabasca. The district between 56° 40′ and 60° N., and between 112° W. and the Rocky mountains is usually known as the Peace River district.

Here about Grande Prairie and Dunvegan some grove-like openings in the forests and a slightly longer growing season than obtains in the districts immediately surrounding, have attracted farming settlement. The Peace River district is now connected by railway with Edmonton and may soon seek an outlet across the Rockies to join the C.N. railway to Prince Rupert. Oats, vegetables and dairy farming do well. There are probably 12 million acres suitable for mixed farming in the Peace basin between Hudson Hope and Vermilion Chutes.

PEACE, freedom from war or hostilities; a state or relation of concord and amity. In international law, that condition of a nation not at war with another. Gudelinus in his *De jure pacis commentarius* (1620) defines peace as "tranquil freedom, contrary to war of which it constitutes the end and the destruction."

Although ever since the dawn of history war has been a recognised institution and custom, it has been increasingly realised, with the advance of civilisation, that the use of violence and force was an abnormal condition which ought to be entirely eliminated from human affairs. More particularly in the world as it now exists with a dense and rapidly rising population dependent for its maintenance and welfare on highly developed international communications, war means the paralysis, if not the actual destruction, of culture, economic progress and human civilisation. Modern weapons of warfare are now so efficient and destructive that hostilities can no longer be confined to the combatant forces of the belligerents, but bring disaster and the horrors of war to peaceful inhabitants without distinction of age or sex. The problem, therefore, of how best to prevent war assumes at present a more vital importance than it has ever had before.

Much reliance was placed in the past on the "balance of power" and on treaties of military alliance between the great Powers, but such schemes utterly failed to maintain peace in the world. In proportion as they guaranteed immunity from attack to the Powers within the particular group, they tended to stimulate war with outside States and were in fact a cause rather than a prevention of war.

More progressive minds have based their plans for the preservation of peace on a federation or union of all the "civilised" Powers. The creation of an International Tribunal and of an International Legislature form a prominent feature of these schemes. On the other hand, more recent jurists believing that the society of nations is in a perpetual condition of anarchy because it possesses no code of law have advocated the codification of international law so as to render it universal and binding on all nations. Again, disarmament or at least the general limitation of armaments to the lowest possible point, has also been put forward as an essential element of peace.

As to the federation of States for the maintenance of peace, there are three plans which for their outstanding merit and because of the influence they have exercised on the present day organisation of the society of nations, deserve special attention. They are, in the chronological order of their publication, St. Pierre's *Projet pour rendre la paix perpétuelle en Europe;* Jeremy Bentham's *Plan for an Universal and Perpetual Peace* and Kant's *Zum ewigen Frieden.*

Abbe de St. Pierre.—St. Pierre's project, published in 1713, was the outcome of the difficulties attending the settlement of the

peace at the Conference of Utrecht which so much impressed the author that he set out at once to work a scheme for the abolition of war. The first article of the project provides that the twenty-four Christian States of Europe should form themselves into a perpetual alliance for their mutual security against both foreign and civil war and for the mutual guarantee of their respective possessions and of the treaties of peace. The third article enacts that the Allies were to renounce the right of making war against each other and first seek reconciliation through the mediation of the rest of the members of the alliance and, in the event of the failure of mediation, to refer the disagreement for arbitration to the "Senate of Peace" which thus became a permanent and compulsory arbitral court. The sanction for these provisions is contained in article 4 of the project which stipulates that if any of the Allies should refuse to comply with the award of the Senate, for which three-fourths of the votes were sufficient, or should ignore any of the regulations passed by the Alliance or should prepare to wage war, then the Alliance was to arm and act offensively against the contravening State until it was reduced to obedience.

Jeremy Bentham.—Bentham's plan was published in 1789 and is based upon two fundamental principles, both of which the author considered essential for the success of the peace movement:—(1) the reduction and fixation of the forces of the several States which composed the European Concert; (2) the emancipation of the colonial dependencies of each State as such colonies were a constant source of war. As a natural corollary to the preservation of peace, Bentham urged the establishment of an International Court of Judicature for the settlement of disputes between the States and also of a Common Legislature for recording the resolutions agreed to by the States and for placing under the ban of Europe any State which should refuse to conform itself to these resolutions. The most powerful instrument, however, for the sanction of these resolutions was public opinion, aided by the liberty of the Press and the suppression of secret diplomacy.

Immanuel Kant.—Kant's project for a perpetual peace (published in 1795) is based upon the same idea of a general federation of States, but is further developed on more general and universal lines The author lays down as a first condition of a perpetual peace that the civic constitution of every State adhering to the proposed league should be republican, viz., a form of government where every citizen participates by his representatives in the exercise of the legislative power and especially in that of deciding on the question of peace as against war. The second condition is that the public law of Europe should rest on a federation of *free* States. Nations cannot escape from the lawless condition which connotes wars unless they renounce, as private individuals have renounced, their uncivilised ways and submit themselves to obligatory public laws and form thus a *civitas gentium* which should gradually extend so as to comprise ultimately all the peoples of the world Here then is the first idea of an organisation which includes all nations, and not only the Christian or European States as in all the schemes that have preceded Kant's.

THE HAGUE PEACE CONFERENCES

The first time that a gathering of nations ever assembled for discovering means to maintain peace occurred in 1899 at The Hague Conference at which twenty-six States participated. The chief outcome of their deliberations was the Convention for the Pacific Settlement of International Disputes. The Second Peace Conference of 1907, which also met at The Hague and included the representatives of forty-four States—practically the whole of the world's then independent nations—re-affirmed the Convention and further developed it.

Mediation.—The first method advocated by The Hague Convention for the prevention of wars is Mediation (articles 2 to 8) Mediation itself was not a new instrument in international relations. Both the Peace Treaty of Paris, 1856, and the Berlin Act, 1885, provide for an appeal to mediation for the purpose of avoiding further conflicts in the Near East between the signatory Powers. But what is special in The Hague Convention is its generalisation which makes it applicable to all conflicts and the recognition that even States which are stranger to a dispute have a right to offer their good offices or mediation and that the exercise of this right must never be regarded as an unfriendly act.

Arbitration.—The second method put forward by The Hague Convention for the pacific settlement of disputes is Arbitration, which has in fact proved the best instrument for avoiding war in the past Since the period following the Napoleonic wars, arbitration has steadily increased and the impetus given to it by The Hague Conferences has further developed this "most equitable and efficacious" means for the preservation of peace. A "Permanent Court of Arbitration" was set on foot at The Hague in 1900 in accordance with the organisation provided in The Hague Convention. The fundamental principle is contained in Article 15 of the Convention:—"International arbitration has for its object the settlement of differences between States by judges of their own choice and on the basis of respect for law." In 1903 an important step was taken by Great Britain and France which agreed to submit to arbitration all disputes of a legal nature not involving their "vital interests, independence, honour or the interests of third States." Many other Powers followed the lead given by this treaty, but there is a serious drawback in the restrictive clause of vital interests and also in the fact that the question whether a dispute is of a legal nature or not is left to the discretion of the parties. The subject of compulsory arbitration was lengthily discussed at the Second Peace Conference, 1907, but no agreement to a Convention by absolute majority could be obtained although thirty-one States voted in its favour. The final Act of the Conference contains the following declaration:—"The Conference is unanimous in (1) admitting the principle of compulsory arbitration; (2) in declaring that certain disputes, in particular those relating to the interpretation and application of the provisions of international agreements, may be submitted to compulsory arbitration without any restriction." Meanwhile, arbitration treaties are multiplying. In the recent treaty concluded between the United States and France on February 6, 1928, and which is intended to serve as a model for similar treaties with the other Powers, the restrictive clause of vital interests, independence and honour has been suppressed and all legal disputes are declared to be subject to arbitration with the only exception of disputes which are within the "domestic" jurisdiction of either of the parties (including the Monroe doctrine for the United States) or involve the interests of third parties (France further reserved her obligations under the Covenant of the League of Nations.) In this respect, the new treaty is much more satisfactory as it expressly specifies the questions excluded from arbitration and avoids the use of phrases which can be construed as including almost all international disputes.

International Commissions of Inquiry.—For the investigation of facts likely to lead to a war and with which the parties are insufficiently acquainted, The Hague Peace Conferences recommend the setting up of International Commissions of Inquiry entrusted with the duty of examining these facts and reporting thereon. Disputes involving the honour or the vital interests of the parties are, however, expressly excluded This new institution was used for the first time in the Dogger Bank incident of 1904 and most probably averted war between Great Britain and Russia. In 1914 the so-called Bryan Peace Treaties were signed providing for the establishment of Permanent International Commissions of Inquiry in all cases, even those involving the honour and vital interests of the contracting Powers with the obligation imposed upon them to refrain from hostilities until the inquiry was over. Thirty-one States have so far adhered to these treaties

THE LEAGUE OF NATIONS

The League established as an integral part of the treaties of peace which terminated the war of 1914–18 represents a serious effort to organise the community of States through a written Charter—the Covenant of the League of Nations. Before this war, no organised body was in existence to detect the first menace of conflicts and by opportune action to prevent recourse to arms.

By article 11 of the Covenant every war or threat of war—whether immediately affecting any of the member States of the League or not—is declared to be a matter of concern to the whole League which is empowered to take any action that may be deemed wise and effectual to safeguard the peace of the world. The League's organs—the Assembly and the Council—are intended to bring within full public discussion any international dispute likely to lead to war and by maintaining personal contacts and co-operation between the leading statesmen of the world to allow time, by a procedure of delay, for passions to cool. The methods adopted in the Covenant for the prevention of war (when diplomacy and mediation have failed) are set out in article 12 which is as follows:—"The members agree that if there should arise between them any dispute likely to lead to a rupture, they will submit the matter either to arbitration or judicial settlement or to an inquiry by the Council and they agree in no case to resort to war until three months after the award by the arbitrators or the judicial decision or the report of the Council." The reference in the article to "judicial settlement" is meant to imply submission of the dispute to the *Permanent Court of International Justice* set up at The Hague by a unanimous vote of the Assembly of the League of Nations on December 13, 1920. The creation of this tribunal has for the first time in the world's history provided States with a real Court of Justice organised on strictly judicial lines. Its jurisdiction is, on principle, optional. Article 36 of the Statute of the Court offers, however, to States the possibility of making this jurisdiction obligatory by providing that they may by a declaration recognise as "compulsory *ipso facto* and without special agreement the jurisdiction of the Court in all or any of the classes of legal disputes concerning (*a*) the interpretation of a treaty; (*b*) any question of international law; (*c*) the existence of any fact which, if established, would constitute a breach of an international obligation; and (*d*) the nature and extent of the reparation to be made for the breach of an international obligation." So far only 15 States have effectively bound themselves to this compulsory jurisdiction and the only Great Power amongst them is Germany. The establishment of the Permanent Court does not displace the Court of Arbitration organised by The Hague Peace Conferences but leaves to States the choice between two kinds of jurisdiction, the one judicial and the other arbitral. On the other hand, the Permanent Court of Justice has a further function which was never possessed by the Court of Arbitration, the function to deliver advisory opinions upon any dispute or question referred to it by the Council or the Assembly of the League of Nations and thus help these bodies in their task of effecting a conciliation by supplying them with an authoritative legal opinion on the question in controversy. For disputes other than those of a legal nature and which cannot therefore be satisfactorily settled by either a judicial settlement or by arbitration, the Covenant provides for submission to an inquiry by the Council and, as a further resort, to the Assembly of the League. The Council's functions in such a case are threefold:—(1) to investigate the dispute; (2) to endeavour to effect a conciliation; (3) either unanimously or by a majority vote to publish a report setting forth the facts of the dispute and proposing a recommendation for its settlement (articles 15 and 17 of the Covenant). And a general tendency has recently grown up to adopt *Conciliation Commissions* in the first instance with subsequent reference to the Council if the Commission's proposals are not accepted by the parties to the dispute. The third Assembly of the League, by a unanimous resolution adopted on September 22, 1922, recommended the conclusion by States of treaties for the setting up of such Conciliation Commissions.

The methods adopted by the League for the prevention of war have proved up to now so effective as to encourage further hope in the future. It has so far been responsible for the peaceful settlements of disputes, such as that between Sweden and Finland over the Aaland Islands, between Germany and Poland upon the Upper Silesian frontier, between Serbia and Greece and Albania in respect of the latter's boundaries, between Poland and Czechoslovakia upon a similar boundary dispute, between Great Britain and Turkey in regard to the frontiers of 'Iraq, in the Memel incident in January 1923 and in the very grave dispute between Greece and Bulgaria in October 1925. Any one of these incidents might have led to war but for the timely intervention of the League.

The Locarno Pact strove to complete the League of Nation's organisation by definitely securing the adhesion of Germany and eliminating thus that most critical dispute between France and Germany which had proved such a source of wars in Europe. By the Treaty of Mutual Guarantee concluded on October 16, 1925, Germany and France and also Germany and Belgium undertook "that they will in no case attack or invade each other or resort to war against each other." They undertook, further, to settle by peaceful means "all questions of every kind" which might arise between them and which could not be settled by diplomacy. This involves submission to the Permanent Court of International Justice or to a Court of Arbitration of all "questions as to their respective rights," viz., judicial disputes, and reference to a Permanent Conciliation Commission of "all other questions." Failing settlement by conciliation, the dispute is to be dealt with by the Council of the League of Nations. This compulsory submission to judicial settlement or arbitration accepted by France, Germany and Belgium applies also as between Germany and Poland and Germany and Czechoslovakia and constitutes a great step in advance of article 13 of the Covenant of the League which makes such submission voluntary and not compulsory.

The Paris Peace Pact, 1928.—Whilst the League of Nations is the most effective instrument of peace ever devised, it does not completely abolish war, as under articles 15 and 16 of the Covenant both a collective war and an individual war still remain possible either as an ultimate sanction of the League's resolutions or in case all peaceful means have failed. To fill up this gap, a multilateral treaty, known as the Paris Peace Pact, was signed on August 27, 1928, for the "renunciation of war." By December 5, 1928, fifty-nine nations out of the sixty-four independent States of the world, had adhered to the Pact and there was every reason to believe that the remaining five, which are all South American republics, would also at an early date agree to it. The initiative for the conclusion of this treaty rests with Monsieur Briand, the French Foreign Secretary, and the United States Secretary of State, Mr. Kellogg, and followed closely on the Resolution passed unanimously in September 1927 by the Eighth Assembly of the League of Nations that "all wars of aggression are and shall always be prohibited" and that "every pacific means must be employed to settle disputes of every description which may arise between States." The Paris Pact extends this prohibition to all wars generally and not only to wars of "aggression" which are in fact incapable of any exact definition.

The Pact is a very brief document consisting of three articles only, the last of which is merely a formal one dealing with ratification. The important principle is contained in article I that "the High Contracting Parties solemnly declare, in the name of their respective peoples, that they condemn recourse to war for the solution of international controversies and renounce it as an instrument of national policy in their relations with one another." The article has been purposely drafted in such general terms so as to include all international differences which may arise between the parties and covers therefore not only justiciable disputes, but also political and economical controversies and, generally, all disputes other than domestic ones. On the other hand, the renunciation of war is expressly limited to wars undertaken as "an instrument of national policy"—a term which, according to the official interpretation placed upon it by Mr. Kellogg, excludes wars resorted to under the "inalienable right of self-defence" (United States Note of June 23, 1928, *The Times*, June 25, 1928). The expression itself of an "instrument of national policy" is not defined in the Pact, but the official note of the French Foreign Office of April 19, 1928, explains the words as meaning "an instrument of personal, spontaneous and independent political action in which States take the initiative and not as an action in which they find themselves involved by the application of a treaty such as the Covenant of the League or any other treaty registered at the League of Nations." It must

therefore be presumed that the Pact does not prohibit wars undertaken collectively as a measure of international sanction or coercion, but only wars undertaken by an individual State or group of States in their own interest and not on behalf of the community of nations. Even with this limitation, the Pact assumes the character of the most important international event since the establishment of the League of Nations since it deprives of its legitimacy the right to go to war which has hitherto been regarded as an attribute of sovereignty of every independent State. Up to and including the World War, it has always been a common habit of diplomacy to attach to every proposal for the settlement of a dispute the threat that failure to comply therewith would be followed by war. In the words of Clausewitz war is "an instrument of national policy whereby one nation imposes its will upon another." The Pact takes away this custom of associating warfare with national prestige or interest and commits the contracting parties to the fundamental principle that war ought to be "delegalised" in the international sphere as it has already been delegalised inside every civilised State. It also creates a basis upon which the United States and Russia—not at present members of the League of Nations—can co-operate with the rest of the world in maintaining peace by the solemn declaration agreed to by all the signatory Powers that the "settlement or solution of all disputes or conflicts, of whatever nature or of whatever origin they may be, which may arise between them, shall never be sought except by pacific means" (article 2 of the Pact).

Pan-American Union.—In 1881 Mr. Blaine, the then Secretary of State of the United States, put out the suggestion in his instructions to the United States ministers in Central and South America that delegates of all the American republics should participate in a Congress for the purpose of preventing wars on the American continent Out of this policy has eventually resulted the Pan-American Union whose headquarters are at Washington where also was held in 1889 the first of the Pan-American Conferences which ended in the declaration that "arbitration constituted the public law of the American nations." The other outstanding Pan-American Conferences are those held.—(*a*) at Santiago in 1923 when a Convention for the settlement of disputes was adopted and (*b*) at Havana in February 1928 when two anti-war resolutions were unanimously agreed to by the twenty-one American republics, the first of which contains the declaration that the parties "adopt compulsory arbitration as the means they will employ for the peaceful settlement of their international disputes of a legal character," and the second of which that "every war of aggression is considered illicit and as such declared prohibited" and that "all the American nations must employ peaceful means for the settlement of all conflicts which may arise between them." In pursuance of these resolutions, another Pan-American Conference was held at Washington in December 1928 to draft and adopt appropriate treaties of compulsory arbitration and conciliation.

Codification of International Law.—It was Jeremy Bentham who first advocated the codification of international law as a basis for an everlasting peace between civilised nations. Since then, many attempts have been made to secure peace by the enactment of universal rules binding on all the States of the world. The two Hague Peace Conferences have endowed nations with several Conventions each of which is a model of its kind. The Pan-American Conferences, previously referred to, have adopted many Conventions, the principal object of several of which is the preservation of peace amongst the American republics. The subject has also attracted the serious attention of the League of Nations which, through its "Committee of Experts for the progressive codification of International Law," is now working at the gradual development of an international code. Such a code constitutes an absolute necessity now that a Permanent Court of International Justice is in existence.

Disarmament.—It is being increasingly realised that the existing rivalry in armaments and military preparations is a real threat to the preservation of peace There is considerable force in the argument advanced by pacifists that the renunciation of war as an instrument of national policy and the simultaneous building of more instruments of war are in reality incompatible. The plea that such armaments are necessary for a nation's security leads to a vicious circle since no nation can make itself secure without at the same time making neighbouring States insecure. Reliance on military weapons by one nation inevitably creates the necessity for similar preparation in other nations. This process of emulation in armaments is a policy from which no State can free itself without the co-operation of the other States. Article 8 of the Covenant of the League of Nations, recognising that the maintenance of peace requires the reduction of national armaments, invites the Council of the League to formulate plans for such a reduction and also to advise as to the best means for preventing the effects attendant on the private manufacture of munitions and implements of war which is open to serious objection The work is being now carried on by the "Preparatory Disarmament Commission" of the League which was convened to meet at Geneva on April 15, 1929, for the purpose of discussing a general plan of disarmament. The "necessity of accomplishing the reduction and limitation of armaments with as little delay as possible" formed the subject of an important resolution adopted by the Assembly of the League in September 1928. Another step in the same direction was taken by the Treaty for the limitation of Naval Armaments signed at Washington on February 6, 1922, by Great Britain, France, Italy, Japan and the United States binding themselves to scrap a certain number of warships and to limit their construction and acquisition of battleships and the calibre of the guns to be carried. No agreement, however, has as yet been found possible on the limitation of the smaller craft such as cruisers, destroyers and submarines. Nor has any treaty been concluded up to now for the reduction of the military or air forces.

Modern Factors of Peace.—The progress registered remains small nor is it possible to anticipate that nations will ever consent to a general disarmament before a feeling of security is established in the international sphere. And the essential condition for such a feeling of security can only be created when the same principle which maintains peace inside the State is extended also to the mutual relations of the States, viz, what Hobbes calls the "social contract," that in no case recourse to violence or force will be made for the settlement of disputes. The Paris Peace Pact is a great step in the right direction But, of course, what is required is, in the first place, a renunciation of war for all purposes without any qualification or restriction. In the second place, States must surrender the right which they claim at present to decide, at their own discretion, whether an international controversy should be submitted or not to peaceful means for its settlement. Submission to a judicial settlement or arbitration for all disputes of a legal character and to conciliation for all other disputes ought to be made compulsory Meanwhile, there are many hopeful signs that the world is tending more and more towards the attainment of peace. One of them is the growth of modern democracy. Resort to wars for the purpose of gratifying the ambition of heads of the State or of increasing their territories or wealth appears difficult, if not impossible, under a democratic system of government where the choice of life and death for thousands of people can no longer depend on the arbitrary wishes of one man or a group of men. Another important factor of great influence is the spread all over the world of Societies bound by their articles to promote peace and understanding amongst the various nations. Prominent examples of such societies are the League to Enforce Peace in the United States and the innumerable League of Nations Unions in the British Empire A further factor of peace is the modern development of the Press and also of the means of transport which tend to bring the peoples of the world more and more together and to increase their mutual knowledge of each other. The whole of mankind is now more linked together than it has ever been before and reciprocal influences for peace, order and justice are bound to react strongly in the community of nations Although war still remains possible and much more remains to be accomplished, the possibility of its breaking out has been reduced to the lowest

limit. The progress that the world has made in the cause of peace in the last ten years surpasses every previous effort. For the first time in the world's history, there is a "common conscience of mankind" intent upon avoiding war and realising that peace is necessary for the development of human progress and civilisation. PEACH, the name of a fruit tree which is included under the genus *Prunus* (*Prunus persica*); its resemblance to the plum is obvious. Others have classed it with the almond as a distinct genus, *Amygdalus;* while others again have considered it sufficiently distinct to constitute a separate genus, *Persica.*

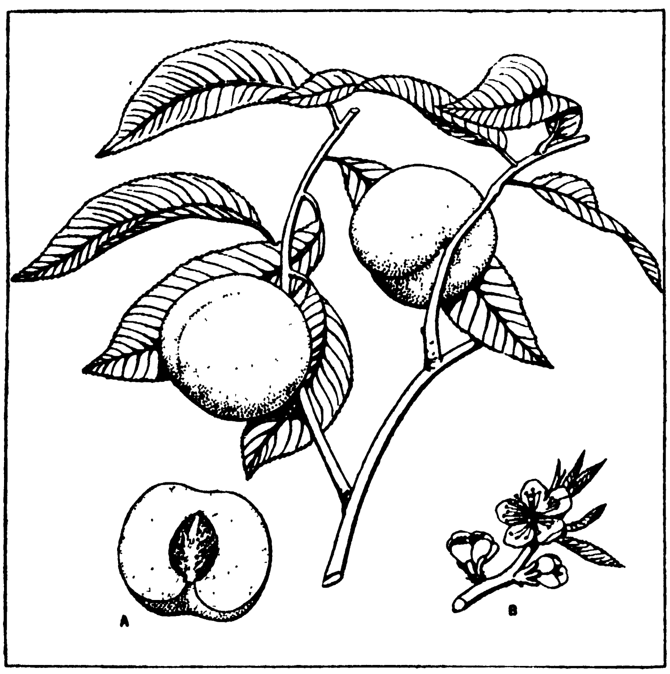
In general terms the peach may be said to be a medium-sized tree, with lanceolate, stipulate leaves, borne on long, slender, relatively unbranched shoots, and with the flowers arranged singly, or in groups of two or more, at intervals along the shoots of the previous year's growth. The flowers have a hollow tube at the base bearing at its free edge five sepals, an equal number of petals, usually concave or spoon-shaped, pink or white, and a great number of stamens. The pistil consists of a single carpel with its ovary, style, stigma and solitary ovule or twin ovules. The fruit is a drupe having a thin outer skin (epicarp) enclosing



BY COURTESY OF THE ROYAL HORTICULTURAL SOCIETY

A BRANCH OF THE PEACH TREE: (A) SECTION OF FRUIT, (B) FLOWERS

the flesh of the peach (mesocarp), the inner layers of the carpel becoming woody to form the stone, while the ovule ripens into the kernel or seed. This is exactly the structure of the plum or apricot, and differs from that of the almond, which is identical in the first instance, only in the circumstance that the fleshy part of the latter eventually becomes dry and leathery and cracks open along a line called the suture.

The nectarine is a variation from the peach, mainly characterized by the circumstance that, while the skin of the ripe fruit is downy in the peach, it is shining and destitute of hairs in the nectarine. That there is no essential difference between the two is, however, shown by the facts that the seeds of the peach will produce nectarines, and vice versa, and that it is not very uncommon, though still exceptional, to see peaches and nectarines on the same branch, and fruits which combine in themselves the characteristics of both nectarines and peaches. The blossoms of the peach are formed the autumn previous to their expansion, and this fact, together with the peculiarities of their form and position, requires to be borne in mind by the gardener in his pruning and training operations. The only point of practical interest requiring mention here is the very singular fact attested by all peach-growers, that, while certain peaches are liable to the attacks of mildew, others are not. In the case of the peach this peculiarity is in some way connected with the presence of small glandular outgrowths on the stalk, or at the base of the leaf. Some peaches have globular, others reniform glands, others none at all, and these latter trees are more subject to mildew than are those provided with glands.

As to the origin of the peach two views are held, that of A. de Candolle, who attributes all cultivated varieties to a distinct species, probably of Chinese origin, and that adopted by many naturalists, but more especially by Darwin, who looks upon the peach as a modification of the almond. The botanical evidence seems to indicate that the wild almond is the source of cultivated almonds, peaches and nectarines, and consequently that the peach was introduced from Asia Minor or Persia, whence the name *Persica* given to the peach. On the other hand, de Candolle, from philological and other considerations, considers the peach to be of Chinese origin, though it is not found wild there.

For further details, *see* C. Darwin, *The Variation of Animals and Plants under Domestication* (1868); A. de Candolle, *The Origin of Cultivated Plants* (1884). (X.)

Cultivation in the United States.—The first Spanish explorers brought the peach to the New World and as early as 1600 peaches were common in Mexico. Before the lapse of another century the peach had been carried by explorers, settlers and Indians to every part of the two continents where this fruit is now grown. Nowhere else in the world does the peach thrive so well as in temperate parts of the Western Hemisphere. Soil and climate exactly suit the peach in the Americas so that soon after its introduction in the New World it became a wide-spread escape from cultivation and early botanists considered it a native. In no other part of the world is the peach so largely grown as a commercial product as in the peach regions of the United States. Using the census report of 1920 as a basis of calculation, it can be stated that the commercial value of the peach crop of the United States is about $35,000,000 per annum. Formerly a luxury, the peach is now a necessity in American homes and is used fresh, dried or canned the year around. The value of canned peaches in the United States is about one-seventh that of the total value above given. The peach ranks second to the apple in the fruit industry of the United States.

Hedrick, in a monograph on the peach in New York published in 1917, described 2,181 varieties, nearly all of which are or have been grown in some part of the United States. Probably 500 sorts are to be found in American orchards and nurseries at the present time. All of the many kinds grown on the American side of the Atlantic, with less than a half-dozen exceptions, have originated in the regions where grown to meet the needs of a very distinctive American peach industry.

The cultivation of this fruit in the New World differs markedly from the methods of growing in the Old World. Orchards are more extensive, culture less intensive; trees are always grown as standards, never trained on walls or in arbitrary shapes; nearly all of the kinds are yellow-fleshed and free of stone, seldom with white flesh which often clings to the stone as in Europe. The suppression of diseases by spraying and orchard hygiene is much more necessary in America than in Europe.

Two unusual diseases unknown in Europe take tremendous toll from American peach orchards. One of these diseases, peach yellows, the more virulent, spread like a wave of fire through the peach orchards of America a half-century ago before methods of control were discovered. The disease is much less virulent now

than when it first made its appearance and is controlled fairly well by removing all diseased trees. The cause of the disease is generally supposed to be some lowly organism, as it is violently contagious. "Little peach," which appeared a few decades later than peach yellows, is likewise contagious through some unknown organism, and just as "yellows" is named from yellow foliage, so "little peach" receives its name from small peaches which are inedible. Like the yellows it is controlled by cutting out diseased trees.

The following are the leading commercial varieties named in order of ripening·

Mikado (June Elberta),—the earliest yellow-fleshed peach; handsome, good; Greensboro,—productive, hardy, white-fleshed, good, semi-clingstone; Rochester,—yellow, freestone, excellent quality, a desirable early variety; Carman,—white, freestone, good in quality, Champion,—excellent quality, white, semi-clingstone, home use; Belle of Georgia,—white, handsome, semi-freestone, good; Early Crawford,—splendid yellow peach, freestone, uncertain bearer; South Haven,—yellow, freestone, hardy, promising new sort; J H Hale,—very large, handsome, yellow, freestone, requires cross pollination; Early Elberta,—Elberta type but earlier, freestone; Elberta,—the leading commercial peach in New York, handsome, large, yellow, freestone; Wilma,—Elberta type, ripening a week later, freestone; Crosby,—yellow, freestone, good quality, hardy; Chili,—yellow, freestone, late, excellent for home canning. (U P H.)

PEACHAM, HENRY (*c.* 1576–*c.* 1643), English writer, was the son of Henry Peacham, curate of North Mimms, Hertfordshire, and author of a book on rhetoric called the *Garden of Rhetoric* (1577). The elder Peacham became in 1597 rector of Leverton, Lincolnshire The son was educated at Trinity college, Cambridge, where he graduated B A in 1594–95 and M A in 1598. He was for some time a schoolmaster at Wymondham, Norfolk, but settled in London in 1612, earning his living as tutor to young men preparing for the universities His first book was *Graphice* (1606), a treatise on pen and water-colour drawing, which, as *The Gentleman's Exercise,* passed through three editions. The years 1613–14 he spent abroad, part of the time as tutor to the three young sons of Thomas Howard (1585–1646), earl of Arundel, and partly on his own account He travelled in Italy, France, Westphalia and the Netherlands The table of Sir John Ogle, English governor of Utrecht, was, he says, a "little academy," where he met soldiers and scholars of all nationalities When he returned to London he was accused of libel on the king. The charge was, however, easily rebutted

Peacham had many friends in London, among them Thomas Dowland the musician, Inigo Jones, and Edward Wright the mathematician In 1622 appeared Peacham's magnum opus, the *Compleat Gentleman* Enlarged editions appeared in 1626 and 1627 The 1627 edition was reprinted in 1634, and a third, with additional notes on blazonry by Thomas Blount (1617–79), appeared in 1661. Peacham was a Cavalier, even an ardent polemist in the royal cause, but the central point of his book is a more or less Puritan sentiment of duty In his later years Peacham was reduced to extreme poverty, and is said to have written children's books at a penny each His last book was published in 1642, and it may be concluded that he died soon afterwards

His other works include· *Minerva Britanna* (1612), dedicated to Henry, prince of Wales, *The Period of Mourning* (1613), in honour of the same prince; *Thalia's Banquet* (1620), a book of epigrams; *The Art of Living in London* (1642), and *The Worth of a Peny* (1641), etc. There is a nearly complete collection of Peacham's works in the Bodleian, Oxford Harleian MS 6855 contains a translation by Peacham of James I's *Basilicon doron* into Latin verse, written in his own hand and ornamented with pen and ink drawings. His *Compleat Gentleman* was edited by G. S. Gordon in 1906 for the Clarendon Press; the *Art of Living* is reprinted in the *Harleian Misc.* ix.; *The Worth of a Peny* in E Arber's *English Garner* (vol vi. 1883)

PEACH TREE BORER, a North American sesiid moth (*Aegeria exitiosa*), one of the most important and serious enemies of the peach in the United States It is supposed to cause damage to the amount of $6,000,000 annually. The principal injury occurs east of the Rocky mountains, from Canada south to Florida. It attacks trees of all ages. Its original food plants were probably wild cherry and wild plum. It also attacks nectarines, apricots, prunes, almonds and plums, but is pre-eminently injurious to the peach. The adult moth is a clear-winged creature resembling a wasp at first glance. It has a wing-spread of about 1¼ in. The eggs are laid about the base of the tree, and the larvae bore rapidly under the bark and downwards toward the collar. The larva feeds and grows rapidly, and remains in the larval state from May or June through the following winter, transforming to pupa in the spring, enclosed in a silken cocoon in which are incorporated bits of bark and excrement. Many larvae may be found in the same peach trunk, the number varying from 2 or 3 to 40 or 50 Ninety such larvae have been found in one peach tree six or seven years old.

Although the insect has several hymenopterous parasites, artificial control work is very necessary In the old days much laborious hand work was done The earth was removed from around the crown, the trunk brushed or scraped, and the borers removed with a knife Of late, however, paradichlorobenzene has come into use. This is a white crystalline substance which vaporizes readily The bases of the trees should be cleaned, and the material should then be applied evenly in a circular band 1 in. or 2 in wide at a distance of about 2 in from the tree trunk Then it is covered with earth arranged so as to make a cone-shaped mound around the tree. The fumes of the chemical will kill the larval borers

For an illustrated practical account of this insect, see *Farmers' Bulletin* No. 1246, U S Department of Agriculture. (L. O. H.)

PEACOCK, THOMAS LOVE (1785–1866), English novelist and poet, was born at Weymouth on Oct 18, 1785, the only son of a London glass merchant, who died soon after the child's birth He was educated at a private school at Englefield Green, and after a brief experience of business determined to devote himself to literature His first books were poetical, *The Monks of St. Mark* (1804), *Palmyra* (1806), *The Genius of the Thames* (1810), *The Philosophy of Melancholy* (1812)—works of no great merit. He also made several dramatic attempts, which were never acted. He served for a short time as secretary to Sir Home Popham at Flushing, and paid several visits to Wales In 1812 he became acquainted with Shelley. In 1815 he showed his real bent by writing his novel *Headlong Hall.* It was published in 1816, and *Melincourt* followed in the ensuing year. During 1817 he lived at Great Marlow, enjoying the almost daily society of Shelley, and writing *Nightmare Abbey* and *Rhododaphne,* by far the best of his long poems. In 1819 he was appointed assistant examiner at the India House. About this time also he proposed marriage, by letter, to Jane Griffith, whom he had not seen for eight years. They had four children, only one of whom, a son, survived his father; one daughter was the first wife of George Meredith. His novel *Maid Marian* appeared in 1822, *The Misfortunes of Elphin* in 1829, and *Crotchet Castle* in 1831; and he would probably have written more but for the death in 1833 of his mother. He also contributed to the *Westminster Review* and the *Examiner.* His services to the East India Company, outside the usual official routine, were considerable He was especially concerned with steam navigation to India, and after representing the company before parliamentary committees on the subject, superintended the construction of iron steamers which proved successful He also drew up the instructions for the Euphrates expedition of 1835. In 1836 he succeeded James Mill as chief examiner, and in 1856 he retired upon a pension. During his later years he contributed several papers to *Fraser's Magazine,* including reminiscences of Shelley, whose executor he was. He also wrote in the same magazine his last novel, *Gryll Grange* (1860) He died on Jan. 23, 1866, at Lower Halliford, near Chertsey, where so far as his London occupations would allow him, he had resided for more than forty years.

Novels.—Peacock's position in English literature is unique There was nothing like his type of novel before his time; though there might have been if it had occurred to Swift to invent a story as a vehicle for the dialogue of his *Polite Conversation* Peacock speaks as well in his own person as through his puppets; and his pithy wit and sense, combined with remarkable grace and accuracy of natural description, atone for the primitive simplicity of plot and character. Of his seven fictions, *Nightmare Abbey* and *Crotchet Castle* are perhaps on the whole the best, the former displaying the most *vis comica* of situation, the latter the fullest

maturity of intellectual power, and the most skilful grouping of the motley crowd of "perfectibilians, deteriorationists, statu-quo-ites, phrenologists, transcendentalists, political economists, theorists in all sciences, projectors in all arts, morbid visionaries, romantic enthusiasts, lovers of music, lovers of the picturesque and lovers of good dinners," who constitute the dramatis personae of the Peacockian novel. *Maid Marian* and *The Misfortunes of Elphin* are hardly less entertaining. Both contain descriptive passages of extraordinary beauty. *Melincourt* is a comparative failure, the excellent idea of an orang-outang mimicking humanity being insufficient as the sole groundwork of a novel. *Headlong Hall* and *Gryll Grange* complete the list of his novels. The latter contains the most beautiful of his poems, "Years Ago," the reminiscence of an early attachment. The ballads and songs interspersed through his tales have much charm; his longer poems have less interest.

Peacock's works were collected, though not completely, and published in three volumes in 1875, with an excellent memoir by his granddaughter Mrs. Clarke, and a critical essay by Lord Houghton. His prose works were collected by Richard Garnett in ten volumes (1891). The Halliford edition (H. F. B. Brett-Smith and C. E. Jones, 1924–) will contain the whole of Peacock's works when completed. *See* A. B. Joung, *The Life and Novels of Thomas Love Peacock* (1904). For an interesting personal notice, see *A Poet's Sketch Book*, by R. W. Buchanan (1884). (R. G.; X.)

PEACOCK (*Pavo cristatus*), a beautiful and well known bird, proverbial personification of pride. It inhabits India and Ceylon, whence it has been introduced into aviaries and private parks in many parts of the world. Its most famous ornament is the long tail-coverts; the feathers of the train bear the "peacock eyes" at their distal ends. The crest on the head and the colour of the neck and breast are also of great beauty. The display of the male consists in the spreading of the train, accompanied at intervals by a shivering or rattling of the quills. The bird was formerly much esteemed for the table. A white variety is known and also a blue one, termed the Japanese peacock; both of these are the result of domestication. A second species (*P. muticus*) inhabits Burma and Java, and somewhat resembles the Japanese variety, but possesses a golden-green neck and breast.

THE INDIAN PEACOCK

PEAK, THE, a high table-land in the north of Derbyshire, England, included in the Pennine range of hills. The name, however, is extended to cover the whole of the hilly district north of Buxton. The table-land reaches an elevation of 2,088 ft. in Kinder Scout. The geological formation is millstone-grit, and the underlying beds are not domed, but cup-shaped, dipping inward from the flanks of the mass. The summit is a peaty moorland, through which masses of rock project. (*See* DERBYSHIRE.)

PEALE, CHARLES WILLSON (1741–1826), American portrait painter, celebrated especially for his portraits of Washington, was born in Queen Anne county (Md.), on April 16, 1741. During his infancy the family removed to Chestertown, Kent county (Md.), and after the death of his father (a country schoolmaster) in 1750 they removed to Annapolis. Here, at the age of 13, he was apprenticed to a saddler. About 1764 he began seriously to study art. He got some assistance from Gustavus Hesselius, a Swedish portrait painter then living near Annapolis, and from John Singleton Copley in Boston; and from 1767 to 1770 he studied under Benjamin West in London. In 1770 he opened a studio in Philadelphia, and met with immediate success. In 1772, at Mount Vernon, Peale painted a three-quarters-length study of Washington (the earliest known portrait of him), in the uniform of a colonel of Virginia militia. This canvas is now in the Lee memorial chapel of Washington and Lee university. He painted various other portraits of Washington; probably the best known is a full-length, which was made in 1778, and of which Peale made many copies. This portrait had been ordered by the Continental Congress, which, however, made no appropriation for it, and eventually it was bought for a private collection in Philadelphia. Peale painted two miniatures of Mrs. Washington (1772 and 1777) and portraits of many of the famous men of the time, a number of which are in Independence hall, Philadelphia.

Peale removed to Philadelphia in 1777, and served as a member of the committee of public safety; he aided in raising a militia company, became a lieutenant and afterwards a captain, and took part in the battles of Trenton, Princeton and Germantown. In 1779 and 1780 he was a member of the Pennsylvania assembly, where he voted for the abolition of slavery. He freed his own slaves whom he had brought from Maryland. In 1801 he undertook, largely at his own expense, the excavation of the skeletons of two mastodons in Ulster and Orange counties, N.Y., and in 1802 he established at Philadelphia Peale's museum. He was one of the founders, in 1805, of the Pennsylvania Academy of the Fine Arts at Philadelphia. At the age of 81 Peale painted a large canvas, "Christ Healing the Sick at Bethesda," and at 83 a full-length portrait of himself, now in the Academy of the Fine Arts. He died at his country home, near Germantown (Pa.), on Feb. 22, 1826.

His brother, JAMES PEALE (1749–1831), also an artist, painted two portraits of Washington (one now the property of the New York Historical Society, and the other in Independence hall, Philadelphia), besides landscapes and historical compositions.

PEALE, REMBRANDT (1778–1860), American artist, was born in Bucks county (Pa.), on Feb. 22, 1778, the son of Charles Willson Peale (*q.v.*). He studied under his father, under Benjamin West in London (1802–03), and in Paris in 1807 and 1809. As early as 1795 he had begun from life a portrait of Washington. Of this he made many replicas, the latest in 1823, purchased by the U.S. Government in 1832, and now in the Capitol at Washington.

His portraits include those of President Jefferson, Mrs. Madison, Commodores Perry, Decatur, and Bainbridge, Houdon, the sculptor, General Armstrong, and an equestrian portrait of General Washington, now in Independence hall, Philadelphia. His "Court of Death" (1820) is in the Detroit art gallery. In 1825 Peale succeeded John Trumbull as president of the American Academy of Fine Arts (founded in 1802 as the New York Academy of Fine Arts), and he was one of the original members of the National Academy of Design. He wrote several books, among them *Notes on Italy* (1831), *Reminiscences of Art and Artists* (1845). He died in Philadelphia on Oct. 3, 1860.

A brother, RAPHAELLE PEALE (1774–1825), was one of the earliest of American still-life painters; and another brother, TITIAN RAMSEY PEALE (1800–1885), made numerous drawings, some of them in water-colour, in illustration of animal life.

See "Rembrandt Peale," partly autobiographical, in C. E. Lester's *The Artists of America* (1846).

PEANUT (Ground-nut, Earth-nut, Pistache de Terre, Monkey nut, Goober, Manilla nut), the fruit or pod of *Arachis hypogaea* (family Leguminosae). The plant is an annual of diffuse habit, 1 to 2 ft. high, with hairy stem, and two-paired, abruptly pinnate leaflets. The pods or legumes are stalked, oblong, cylindrical, about 1 in. in length, the thin reticulated shell containing from one to three irregularly ovoid seeds. After the flower withers, the flower stalk has the peculiarity of elongating and bending down, forcing the young pod underground, and thus the seeds become matured at some distance below the surface. Hence the specific and various vernacular names of the plant. Originally a native of South America, it is extensively cultivated in all tropical and sub-tropical countries. The plant thrives in a light sandy soil, and is very prolific. The pods when ripe are dug up and dried. The seeds are largely eaten fresh in tropical countries; when roasted they are used in various ways for food. The seeds yield a large quantity of oil, which is used by natives for lamps, as a fish or curry oil and for medicinal purposes. The leaves form an excellent food for cattle, being very like clover.

Large quantities of seeds are imported to Europe, chiefly for the oil. The seeds yield from 42 to 50% of oil by cold expression, but a larger quantity is obtained by heat, although of inferior quality. The seeds being soft facilitate mechanical expression, and where a solvent is used, a very pure oil is obtained. The expressed oil is limpid, of a light yellowish or straw colour, having a faint

smell and bland taste; it forms an excellent substitute for olive oil and is used in various food preparations.

In 1925 the principal countries importing peanuts were: France, 1,503,887,000 lb.; Germany, 713,245,000 lb.; United Kingdom, 335,004,000 lb.; Netherlands, 229,540,000 lb.; and the United States, 120,158,000 pounds. The chief exporting countries were: British India, 1,036,670,000 lb; Senegal, 985,409,000 lb.; and China, 530,227,000 pounds. The principal countries exporting peanut oil were: China, 78,408,000 lb; France, 53,744,000 lb; Netherlands, 26,336,000 lb.; and the United Kingdom, 25,431,000 pounds. The chief importing countries were: Netherlands, 40,209,000 lb.; United Kingdom, 25,148,000 lb., Algeria, 23,542,000 lb.; Germany, 23,016,000 lb.; and Canada, 16,134,000 pounds.

Since 1900, when the annual production was about 100,000,000 lb, peanut culture in the United States has very greatly increased In 1927 the total crop, grown on 1,128,000 ac, amounted to 806,990,000 lb, valued at $32,501,000; 80% of this yield was produced in four States—Georgia, North Carolina, Alabama and Virginia, ranking in the order named The value, in 1925, of the products of the peanut roasting, shelling and cleaning establishments was $20,623,810 Throughout the country roasted peanuts, which are eaten out of hand, are everywhere sold in confectioners' shops and by street venders; peanuts are also extensively used in making various confections Since 1900 the food preparation known as peanut butter has become increasingly popular and is now regularly sold by grocers; the value at the factory of the peanut butter produced in 1925 was $6,200,547 The consumption of peanut oil for food and other purposes exceeds the supply available from domestic crops, resulting in extensive importations of peanuts for oil-extraction.

PEAR, a fruit-bearing tree (*Pyrus communis*) belonging to the rose family and very closely allied to the apple (*q v*), cultivated since ancient time for its juicy pome fruit. The pear differs from the apple in its more erect manner of growth, smooth, shining, very finely-toothed leaves, pure white (rarely pink) flowers, the granular flesh of the ripe fruit, and also in the shape of the fruit, which tapers toward the inner end and has no depression around the stem. In both the pear and the apple the edible part of the fruit is formed from the greatly enlarged end of the flowering stem This encloses within its flesh the five somewhat horny seed-containing vessels (carpels) constituting the "core," which is really the true fruit

The main distinction is the presence in the tissue of the fruit, or beneath the rind, of clusters of cells filled with hard woody deposit in the case of the pear, constituting the "grit," while in the apple no such formation of woody cells takes place The appearance of the tree—the bark, the foliage, the flowers—is, however, usually quite characteristic in the two species Cultivated pears, whose number is enormous, are without doubt derived from one or two wild species widely distributed throughout Europe and western Asia.

The cultivation of the pear extends to the remotest antiquity. Traces of it have been found in the Swiss lake-dwellings; it is mentioned in the oldest Greek writings, and was cultivated by the Romans. The word "pear" or its equivalent occurs in all the Celtic languages, while in Slavonic and other dialects different appellations, but still referring to the same thing, are found—a diversity and multiplicity of nomenclature which led Alphonse de Candolle to infer a very ancient cultivation of the tree from the shores of the Caspian to those of the Atlantic.

Cultivation.—The pear may be readily raised by sowing the pips of ordinary cultivated or of wilding kinds, these forming what are known as free or pear stocks, on which the choicer varieties are grafted for increase For new varieties the flowers should be fertilized with a view to combine, in the seedlings which result from the union, the desirable qualities of the parents The dwarf and pyramid trees, more usually planted in gardens, are obtained by grafting on the quince stock, the Portugal quince being the best.

In selecting young pear trees for walls or espaliers, some prefer plants one year old from the graft, but trees two or three years trained are equally good. The trees should be planted immediately before or after the fall of the leaf. The wall trees require to be planted from 25 to 30 ft. apart when on free stocks, and from 15 to 20 ft. when dwarfed. Where the trees are trained as pyramids or columns they may stand 8 or 10 ft. apart, but standards in orchards should be allowed at least 30 ft., and dwarf bush trees half that distance

In the formation of the trees the same plan may be adopted as in the apple. For the pear orchard a warm situation is very desirable, with a soil deep, substantial, and thoroughly drained. It is useless attempting to grow pears in low-lying districts subject to spring frosts: although the trees will thrive and flower, frosts often cause such havoc in these districts that a crop of fruit is rarely produced. Any good free loam is suitable, but a calcareous loam is the best. Pear trees worked on the quince should have the stock covered up to its junction with the graft. This is effected by raising up a small mound of rich compost around it, a contrivance which induces the graft to emit roots into the surface soil, and also keeps the stock from becoming hard or bark-bound The fruit of the pear is produced on spurs, which appear on shoots more than one year old The mode most commonly adopted of training wall pear trees is the horizontal For the slender twiggy sorts the fan form is to be preferred, while for strong growers the half-fan or the horizontal is more suitable.

The summer pruning of established wall or espalier-rail trees consists chiefly in the timely displacing, shortening back, or rubbing off of the superfluous shoots, so that the winter pruning, in horizontal training, is little more than adjusting the leading shoots and thinning out the spurs, which should be kept close to the wall and allowed to retain but two or at most three buds. In fan-training the subordinate branches must be regulated, the spurs thinned out, and the young laterals finally established in their places

Summer and autumn pears should be gathered before they are fully ripe, otherwise they will not in general keep more than a few days The Jargonelle should be allowed to remain on the tree and be pulled daily as wanted, the fruit from standard trees thus succeeding the produce of the wall trees

Diseases.—The pear is subject to several diseases caused by fungi. *Gymnosporangium sabinae*, one of the rusts (Uredineae) passes one stage of its life-history on living pear leaves, forming large raised spots or patches which are at first yellow but soon become red and are visible on both faces; on the lower face of each patch is a group of cluster-cups or aecidia containing spores which escape when ripe This stage in the life-history was formerly regarded as a distinct fungus; it is now known, however, that the spores germinate on young juniper leaves, in which they give rise to this other stage in the plant's history known as *Gymnosporangium*.

Pear scab is caused by a parasitic fungus, *Venturia pyrina*,

very closely allied to the apple scab fungus. As in the case of the apple disease, it forms large irregular blackish blotches on the fruit and leaves, the injury being often very severe especially in a cool, damp season. The fungus mycelium grows between the cuticle and the epidermis, the former being ultimately ruptured by numerous short branches bearing spores (conidia) by means of which the disease is spread As a preventive spraying with Bordeaux mixture or lime-sulphur wash just before flowering and as soon as the petals have fallen, is recommended.

Pear trees may also be attacked by a great variety of insect pests. Thus the younger branches are often injured by the pearl oyster scale (*Aspidiotus ostreaeformis*), which may be removed by washing in winter with lime-sulphur at winter strength. A number of larvae of Lepidoptera feed on the leaves; the remedy is to capture the mature insects when possible. Winter moths (*Cheimatobia brumata*) and others must be kept in check by putting greasy bands round the trunks from October till December or January, to catch the wingless females that crawl up and deposit their eggs in the cracks and crevices in the bark. In the early stages if the entrance of the caterpillars has been detected, a wire should be pushed into the hole. One of the worst pests of pear trees is the pear midge, *Diplosis pyrivora*, the females of which lay their eggs in the flower-buds before they open. The yellow maggots devour the seeds and thus ruin the crop. When deformed fruits are noticed they should be picked off and burned immediately. Species of aphides may be removed by a nicotine and soap wash. The pear leaf blister mite (*Eriophyes pyri*) sometimes severely injures the leaves, on which it forms blisters: the best remedy is to cut off and burn the diseased leaves. This remedy can only be applied when the disease is recognized at an early stage. When the disease has obtained a hold, spray during the dormant season with an oil emulsion or a lime-sulphur caustic soda wash. (X.)

Cultivation in the United States.—Names and descriptions of varieties of pears in European publications number about 5,000, while in the horticultural literature of the United States not more than 1,000 are to be found This is an indication that the pear is not as popular in the United States as in France, England, Belgium and Germany, the great pear-growing countries of Europe. The reason is that the pear, as compared with other hardy fruits, reaches perfection in comparatively few places in the New World. The climate in most parts of America is uncongenial to the pear, a fruit which thrives only in equable climates and does not endure well the sudden and extreme variations in climate to which most parts of North and South America are subject. In the United States, commercial pear culture is confined to favourable localities on the Atlantic seaboard, about the Great Lakes and on the Pacific slope, and even in these favoured regions the product sent to market comes largely from the plantations of specialists.

Liability to loss by pest is also a great detriment to the popularity of the pear in America. Insect pests of pears are numerous and difficult to combat. Foliage and fruit are attacked by several parasitic fungi, requiring treatment wherever the pear is grown, which, even under very favourable conditions, often fails to give the fruits a fair check A bacterial blight is so serious in effects and virulency as to give it the popular name, "fire blight." The disease is caused by a bacterium which cannot be checked by sprays and is combated only by the drastic remedy of cutting out branches and trees Still another reason why the pear is not a popular dessert fruit in America is that, of all fruits, the varieties of this one are the most variable in the quality of the product. Sorts that should produce pears of the highest quality often bear fruits poor or indifferent in texture or flavour in unfavourable seasons or unsuitable soils And, still again, the pear falls short as a commercial product because it is not easily handled so as to stand transportation or keeping in cold storage, conditions demanded in America.

The care given to growing pears in America is not more exacting than that given any other hardy fruit. The trees respond readily to cultivation, pruning and fertilization. These items of culture are much the same as for the apple, plum, cherry and peach. Once well started, pear orchards perhaps endure more neglect than do orchards of any other tree fruit, if the climate and soil be suitable. Varieties of pears, possibly, have the charm of individuality more marked than varieties of their orchard associates. The fruits are more varied in size, shape, texture and flavour than others of the hardy tree fruits and in length of season exceed all others excepting the apple. For this reason, the pear is the fruit of fruits for connoisseurs, and a splendid collection can, with a little care, be grown in a comparatively small space from the hundred or more varieties to be had from nurseries. Cross pollination is an important factor in the successful culture of pears. Mixed plantings of at least two compatible varieties set in blocks of three to four rows wide are desirable.

The following are leading commercial varieties named in order of ripening.—

Tyson,—hardy, vigorous, blight resistant, a midsummer variety for home use; Clapp's Favorite,—best early pear, large, productive, attractive, blights very badly; Bartlett,—the leading commercial variety; Seckel,—bears late, blight resistant, vigorous, choicely good but small; Beurre Bosc,—attractive, high in quality, blights badly; Sheldon,—excellent quality for home use, unattractive in shape and colour; Winter Nelis,—late keeper, high quality, small and unattractive.

Most of these varieties, as well as nearly all other sorts listed by nurseries, originated in Europe. American pear growing will undoubtedly be greatly benefited when the country has a pear flora of its own. (U. P. H.)

PEARCE, CHARLES SPRAGUE (1851–1914), American artist, was born at Boston (Mass), on Oct. 13, 1851. In 1873 he became a pupil of Léon Bonnat in Paris, and after 1885 he lived in Paris and at Auvers-sur-Oise. He painted Egyptian and Algerian scenes, French peasants, and portraits, and also decorative work, notably for the Congressional library at Washington. He received medals at the Paris Salon and elsewhere, and many decorations. Among his best known paintings are "The Decapitation of St. John the Baptist" (1881), in the Art Institute of Chicago; "Prayer" (1884), owned by the Massachusetts charitable mechanic association; "The Return of the Flock," in the Bohemian club, San Francisco; and "Meditation," in the New York Metropolitan Museum He died in Paris on May 18, 1914.

PEARL, RAYMOND (1879–), American biologist, was born at Farmington (N.H) June 3, 1879 He studied at the University of Michigan, Leipzig, the Naples zoological station and London After holding a number of important appointments he became, in 1925, director of the Institute of Biological Research, a new division of Johns Hopkins university. He became known through his biological researches on variation in organisms, and his studies in heredity. He was a member of the executive committee, chairman of the agricultural committee and member of the executive board of the National Research Council, 1916–19, being also chief of the statistical division of the U.S. Food Administration, 1917–19. (*See* DEATH.)

Pearl wrote, among other works, *Variation and Differentiation in Ceratophyllum; Variation and Correlation in the Crayfish* (with A. B. Clawson, 1907); *Diseases of Poultry: Their Etiology, Diagnosis, Treatment and Prevention* (with F M. Surface and M. R Curtis, 1915); *Modes of Research in Genetics* (1915), *The Nation's Food* (1920); *The Biology of Death* (1922); *Introduction to Medical Biometry and Statistics* (1923); *Studies in Human Biology* (1924); *The Biology of Population Growth* (1925); *Alcohol and Longevity* (1926); *To Begin With* (1927); and *The Rate of Living* (1928).

PEARL. Pearls are calcareous concretions of peculiar lustre, produced by certain molluscs, and valued as objects of personal ornament. The experience of pearl-fishers shows that those shells which are irregular in shape and stunted in growth, or which bear excrescences, or are honeycombed by boring parasites, are those most likely to yield pearls.

The substance of a pearl is essentially the same as that which lines the interior of many shells and is known as "mother-of-pearl." Sir D. Brewster first showed that the iridescence of this substance was an optical phenomenon due to the interference of rays of light reflected from microscopic corrugations of the surface—an effect which may be imitated by artificial striations on a suitable medium When the inner laminated portion of a nacreous shell is digested in acid the calcareous layers are dissolved away,

leaving a very delicate membranous pellicle, which, as shown by Dr. Carpenter, may retain the iridescence as long as it is undisturbed, but which loses it when pressed or stretched.

It is obvious that if a pearl presents a perfectly spherical form it must have remained loose in the substance of the muscles or other soft tissues of the mollusc. Frequently, however, the pearl becomes cemented to the interior of the shell, the point of attachment thus interfering with its symmetry. In this position it may receive successive nacreous deposits, which ultimately form a pearl of hemispherical shape, so that when cut from the shell it may be flat on one side and convex on the other, forming what jewellers know as a *perle bouton*. In the course of growth the pearl may become involved in the general deposit of mother-of-pearl, and be ultimately buried in the substance of the shell It has thus happened that fine pearls have occasionally been unexpectedly brought to light in cutting up mother-of-pearl in the workshop.

When a pearl oyster is attacked by a boring parasite the mollusc protects itself by depositing nacreous matter at the point of invasion, thus forming a hollow body of irregular shape known as a "blister pearl." Hollow warty pearl is sometimes termed in trade *coq de perle*. Solid pearls of irregular form are often produced by deposition on rough objects, such as small fragments of wood, and these, and in fact all irregular-shaped pearls, are termed *perles baroques*, or "barrok pearls."

A pearl of the first water should possess, in jewellers' language, a perfect "skin" and a fine "orient"; that is to say, it must be of delicate texture, free from speck or flaw, and of clear almost translucent white colour, with a subdued iridescent sheen It should also be perfectly spherical, or, if not, of a symmetrical pear-shape.

Pearl Fisheries.—The ancients obtained their pearls chiefly from India and the Persian gulf, but at the present time they are also procured from the Sulu seas, the coast of Australia, the shores of Central America and some of the South Pacific islands The ancient fisheries of Ceylon (Taprobane) are situated in the Gulf of Manaar, the fishing-banks lying from 6 to 8m. off the western shore, a little to the south of the isle of Manaar. The Tinnevelly fishery is on the Madras side of the strait, near Tuticorin These Indian fishing-grounds are under the control of Government inspectors, who regulate the fisheries. The oysters yield the best pearls at about four years of age Fishing generally commences in the second week in March, and lasts for from four to six weeks, according to the season The boats are grouped in fleets of from 60 to 70, and start usually at midnight so as to reach the oyster-banks at sunrise. Each boat generally carries 10 divers. On reaching the bank a signal-gun is fired, and diving commences. A stone weighing about 40 lb is attached to the cord by which the diver is let down The divers work in pairs, one man diving while the other watches the signal-cord, drawing up the sink-stone first, then hauling up the baskets of oysters, and finally raising the diver himself On an average the divers remain under water from 50 to 80 seconds, though exceptional instances are cited of men remaining below for as long as six minutes. In his work the diver makes skilful use of his toes. To arm himself against the attacks of sharks and other fishes which infest the Indian waters he carries spikes of ironwood; and the genuine Indian diver never descends without the incantations of shark-charmers, one of whom accompanies the boat while others remain on shore As a rule the diver is a short-lived man

Since the days of the Macedonians pearl-fishing has been carried on in the Persian gulf It is said that the oyster-beds extend along the entire Arabian coast of the gulf, but the most important are on sandbanks off the islands of Bahrein. The chief centre of the trade is the port of Lingah. Most of the products of this fishery are known as "Bombay pearls," from the fact that many of the best are sold there. Very fine pearls are obtained from the Sulu archipelago, on the north-east of Borneo. The mother-of-pearl shells from the Sulu seas are characterized by a yellow colour on the border and back, which unfits them for many ornamental purposes. Pearl oysters are also abundant in the seas around the Aru islands to the south-west of New Guinea From Labuan a good many pearl-shells are occasionally sent to Singapore. They are also obtained from the neighbourhood of Timor, and from New Caledonia. The pearl oyster occurs throughout the Pacific, mostly in the clear water of the lagoons within the atolls, though fine shells are also found in deep water outside the coral reefs.

Pearl-fishing is actively prosecuted along the western coast of Central America, especially in the Gulf of California, and to a less extent around the Pearl islands in the Bay of Panama. The fishing-grounds are in water about 40ft. deep, and the season lasts for four months An ordinary fishing-party expects to obtain about three tons of shells per day, and it is estimated that one shell in a thousand contains a pearl. The pearls are shipped in barrels from San Francisco and Panama Some pearls of rare beauty have been obtained from the Bay of Mulege, near Los Coyetes, in the Gulf of California; and in 1882 a pearl of 75 carats, the largest on record from this district, was found near La Paz in California. The coast of Guayaquil also yields pearls. Columbus found that pearl-fishing was carried on in his time in the Gulf of Mexico, and pearls are still obtained from the Caribbean sea In the West Indies the best pearls are obtained from St Thomas and from the island of Margarita, off the coast of Venezuela From Margarita Philip II. of Spain is said to have obtained in 1579 a pearl of 250 carats

River Pearls.—River pearls are produced by the species of *Unio* and *Anodonta*, especially by *Unio margaritiferus* These species belong to the family Unionidae, order Eulamellibranchia. They inhabit the mountain-streams of temperate climates in the northern hemisphere The pearls of Britain are mentioned by Tacitus and by Pliny, and a breastplate studded with British pearls was dedicated by Julius Caesar to Venus Genetrix As early as 1355 Scotch pearls are referred to in a statute of the goldsmiths of Paris; and in the reign of Charles II. the Scotch pearl trade was sufficiently important to attract the attention of parliament.

The principal rivers in Scotland which have yielded pearls are the Spey, the Tay and the South Esk; and to a less extent the Doon, the Dee, the Don, the Ythan, the Teith, the Forth and many other streams. In North Wales the Conway was at one time celebrated for its pearls, and it is related that Sir Richard Wynn, chamberlain to the queen of Charles II, presented her with a Conway pearl which is believed to occupy a place in the British crown. In Ireland the rivers of Donegal, Tyrone and Wexford have yielded pearls

River pearls are found in many parts of the United States, and have been systematically worked in the Little Miami river, Warren county, O, and also on the Mississippi, especially about Muscatine, Iowa. The season extends from June to October. Japan produces fresh-water pearls, found especially in the *Anodonta japonica*.

Chinese Pearl Culture.—But it is in China that the culture of the pearl-mussel is carried to the greatest perfection. The Chinese also obtain marine pearls, and use a large quantity of mother-of-pearl for decorative purposes. More than 22 centuries before our era pearls are enumerated as a tribute or tax in China; and they are mentioned as products of the western part of the empire in the *Rh'ya*, a dictionary compiled earlier than 1000 B.C. A process for promoting the artificial formation of pearls in the Chinese river-mussels was discovered by Ye-jin-yang, a native of Hoochow, in the 13th century; and this process is still extensively carried on near the city of Teh-tsing, where it forms the staple industry of several villages Large numbers of the mussels are collected in May and June, and the valves of each are gently opened with a spatula to allow of the introduction of various foreign bodies, which are inserted by means of a forked bamboo stick. These "matrices" are generally pellets of prepared mud, but may be small bosses of bone, brass or wood After a number of these objects have been placed in convenient positions on one valve, the unfortunate mollusc is turned over and the operation is repeated on the other valve. The mussels are then placed in shallow ponds connected with the canals, and are nourished by tubs of night-soil being thrown in from time to time After several months, in some cases two or three years, the mussels are

removed, and the pearls which have formed over the matrices are cut from the shells, while the molluscs themselves serve as food. Millions of such pearls are annually sold at Soo-chow. The most curious of these Chinese pearls are those which present the form of small seated images of Buddha. The figures are cast in very thin lead, or stamped in tin, and are inserted as previously described. Specimens of these Buddha pearls in the British Museum are referred to the species *Dipsas plicata.* It should be mentioned that Linnaeus, probably ignorant of what had long been practised in China, demonstrated the possibility of producing artificial pearls in the fresh-water mussels of Sweden.

Pink pearls are occasionally found in the great conch or fountain shell of the West Indies, *Strombus gigas,* L.; but these, though much prized, are not nacreous, and their tint is apt to fade. They are also produced by the chank shell, *Turbinella scolymus,* L. and other gastropods. Yellowish-brown pearls, of little or no value, are yielded by the *Pinna squamosa,* and bad-coloured concretions are formed by the *Placuna placenta.* Black pearls, which are very highly valued, are obtained chiefly from the pearl oyster of the Gulf of Mexico. The common marine mussel *Mytilus edulis* also produces pearls, which are, however, of little value.

The Pearl Oyster.—Genuine precious pearls and the most valuable mother-of-pearl are produced by various species and varieties of the genus *Margaritifera.* The genus is represented in tropical regions in all parts of the world. It belongs to the family Aviculidae, which is allied to the Pectens or scallop shells. In this family the hinge border is straight and prolonged into two auriculae; the foot has a very stout byssus. *Margaritifera* is distinguished by the small size or complete absence of the posterior auricula. The species are as follows. The type species is *M. margaritifera,* which has no teeth on the hinge. Geographical races are distinguished by different names in the trade. Specimens from the Malay Archipelago have a dark band along the margin of the nacre and are known as black-edged Banda shell; those from Australia and New Guinea and the neighbouring islands of the western Pacific are called Australian and New Guinea black-lip. Another variety occurs in Tahiti, Gambier islands and Eastern Polynesia generally, yielding both pearls and shell. It occurs also in China, Ceylon, the Andaman islands and the Maldives. Another form is taken at Zanzibar, Madagascar and the neighbouring islands, and is called Zanzibar and Madagascar shell. Bombay shell is another local form fished in the Persian gulf and shipped via Bombay. The Red sea variety is known as Egyptian shell. Another variety occurs along the west coast of America and from Panama to Vancouver, and supplies Panama shell and some pearls. A larger form, attaining a foot in diameter and a weight of 10 lb. per pair of shells, is considered a distinct species, *M. maxima.* It is the most valuable species of mother-of-pearl oyster.

Dr. Jameson distinguishes in addition to the above 32 species of *Margaritifera;* all these have rudimentary teeth on the hinge. The most important species is *M. vulgaris,* to which belong the pearl oyster of Ceylon and southern India, the lingah shell of the Persian gulf and the pearl oyster of the Red sea. Since the opening of the Suez canal the latter form has invaded the Mediterranean, specimens having been taken at Alexandria and at Malta, and attempts have been made to cultivate it on the French coast. The species occurs also on the coasts of the Malay peninsula, Australia and New Guinea, where it is fished both for its shells (Australian lingah) and for pearls. Two species occur on the coasts of South Africa but have no market value. *M. carchariarum* is the Shark's bay shell of the London market. It is taken in large quantities at Shark's bay, Western Australia, and is of rather small value; it also yields pearls of inferior quality. The pearl oyster of Japan, known as Japan lingah, is probably a variety of *M. vulgaris. M. radiata* is the West Indian pearl oyster.

The largest and steadiest consumption of mother-of-pearl is in the button trade, and much is also consumed by cutlers for handles of fruit and dessert knives and forks and pocket-knives. It is also used in the inlaying of Japanese and Chinese lacquers, European lacquered papier-mâché work, and trays, &c., and as an ornamental inlay generally. Among the South Sea islands the shell is largely fashioned into fishing-hooks. Among shells other than those of *M. margaritifera* used as mother-of-pearl may be mentioned the green ear or ormer shell (*Haliotis tuberculata*) and several other species of *Haliotis,* besides various species of *Turbo.*

Origin of Pearls.—While there is no doubt that pearls, whether found in oysters or mussels, are the results of pathological processes due to irritants, considerable variation of opinion exists as to the nature of the exciting bodies. As we have seen, the Chinese long ago discovered that river-mussels could be induced to yield pearls by inserting into them foreign bodies to form matrices for the deposition of pearl matter, and pearl culture of this kind has become an industry of importance (*see* PEARL, CULTIVATED).

In the case of the fresh water mussel Filippi of Turin showed in 1852 that the species of Trematode (fluke) *Distomum duplicatum* was the cause of a pearl formation in the fresh-water mussel *Anodonta.* Kuchenmeister subsequently investigated the question at Elster in Saxony and came to a different conclusion, namely that the central body of the pearl was a small specimen of a species of water mite which is a very common parasite of *Anodonta.* Filippi however states that the mite is only rarely found within a pearl, the Trematode occurring in the great majority of cases. R. Dubois and Dr. H. Lyster Jameson have made special investigations of the process in the common mussel *Mytilus edulis.* The sac or cyst is formed by the larva of a species of Trematode belonging to the genus *Lecithodendrium,* a species closely resembling and probably identical with *L. somateriae,* which lives in the adult state in the eider duck. At Billiers, Morbihan, in France, the host of the adult Trematode is another species of duck, namely the common scoter, *Oidemia nigra,* which is notorious in the locality for its avidity for mussels. Trematodes of the family Distomidae, to which the parasite under consideration belongs, usually have three hosts in each of which they pass different stages of the life history. In this case the first host at Billiers is a species of bivalve called *Tapes decussatus,* but at Piel in Lancashire there are no *Tapes* and the first stages of the parasite are found in the common cockle. The Trematode enters the first host as a minute newly hatched embryo and leaves it in the form called cercaria (*see* TREMATODA). The cercaria makes its way into the tissues of a mussel and there becomes enclosed in the cyst previously described. If the mussel is then swallowed by the duck the cercariae develop into adult Trematodes or flukes in the liver or intestines of the bird. In the mussels which escape being devoured the parasites cannot develop further, and they die and become embedded in the nacreous deposit which forms a pearl. Dr. Jameson points out that, as in other cases, pearls in *Mytilus* are common in certain special localities and rare elsewhere, and that the said localities are those where the parasite and its hosts are plentiful.

In the case of the Ceylon pearl oysters, Prof. Herdman concluded that the exciting cause of pearl formation was the larva of a cestode or tapeworm (*q.v.*). The cestode theory has, however, been somewhat discredited in recent years; it is by no means certain that the pearl nucleus is always a parasite; many different exciting causes may lead to pearl formation.

PEARL, ARTIFICIAL. Fine artificial pearls were first made in western Europe in 1680 by Jacquin, a rosary-maker in Paris. Spheres of thin glass are filled with a preparation known as "essence d'orient," made from the silvery scales of a small fish called the bleak (*q.v.*), which is caused to adhere to the inner wall of the globe, and the cavity is then filled with white wax.

STAGES IN JAPANESE PEARL CULTURE

1. Rafts at the Mikimoto pearl culture station, Gokasho Bay, Japan. By means of these rafts great numbers of wire cages filled with young oysters are suspended near the bottom of the sea
2. Japanese diving girls preparing to dive for young oysters which will be used in the culture process. They go to the bottom of the bay and bring up handfuls of oysters which they place in the floating tubs
3. Boat and diver in uniform showing the type of apparatus used for general diving purposes at pearl culture stations
4. Diving girls plunging in the bay from boats. During the pearl season from May to November many girls are employed in the pearl culture stations of Japan. They dive for young oysters and keep the cages free from seaweed and other marine growths
5. Landing the cages. Oysters remain in these cages six or seven years while in cultivation. During this time they are removed, examined and cleaned twice a year. On the top of each cage is placed a tag on which its historical record is kept
6. Preparing oysters for incubation. The young oysters are sorted carefully and only large strong ones are kept.

SPECIMENS OF NATURAL AND CULTIVATED PEARLS

1. Cross section of a natural pearl magnified about 16 times. The concentric structure has developed around the small parasite in the centre, which was the irritant that caused the oyster to form a pearl
2. Cage of the type used in Japan for pearl cultivation; it has a capacity of about 150 pearl oysters
3. Cross section of a culture pearl, magnified about 16 times; it is without concentric structure in the core (a mother-of-pearl bead), and shows the line of cleavage which commonly separates the core from the outer layer of nacre
4. Cross section (magnified) of an Oriental or natural pearl
5. Cross section (magnified) of a culture pearl
6. Drilled culture pearl sawed in half, part of the nacre shell having been broken away during cutting
7. Fine specimen of a culture pearl in the natural state
8. The shell of an Oriental mollusc with imbedded Buddha images, a curious product of pearl cultivation. Cultivated pearls have been produced in China since the 13th century. The Buddha figures are of lead or tin
9. Fish imbedded and covered with mother of pearl in a pearl shell

They are now manufactured in enormous quantities by different processes. An excellent substitute for black pearl is found in the so-called "ironstone jewellery," and consists of close-grained haematite, not too highly polished. Pink pearls are imitated by turning small spheres out of the rosy part of the conch shell, or even out of pink coral.

PEARL, CULTIVATED. "Cultured" pearls are "natural" pearls beautified by the scientific control of their formation and growth. Examination of a section of an "accidental or "natural" pearl shows, in the majority of cases, a nucleus surrounded by a series of concentric layers of pearly nacreous matter. The concentric layers consist alternatively of Calcium Carbonate (Aragonite), and the protein Conchiolin ($C_{30}H_{48}N_9O_{11}$). The nucleus varies, and may consist of sea-weed, sand, a parasite worm, or in general, anything which acts as a foreign irritant to the oyster, and which conforms to specific conditions to be described later. Experimental work on the introduction of nuclei into the oyster so as to obtain pearls, has been carried out principally in China and Japan, but the successful production of the "spherical" cultured pearl was only obtained after assiduous research by the Japanese. K. Mikimoto commenced researches on pearl cultivation in 1891, working on a theory advanced by Dr Mitsukuri (professor of Zoology, Imperial University of Japan) He inserted a small spherical mother-of-pearl bead between the body of the oyster, and the shell, and after several years found that the bead was covered with pearl secretion. Unfortunately these beads were firmly attached to the oyster shell, and therefore resembled "Blister" pearls. A wide range of materials can be used as nuclei, but mother-of-pearl was chosen by the Japanese in order that the pearl should consist entirely of oyster products. The secretion is periodic, and occurs during the warm season. The most vital portion of the oyster for pearl development is the outside of the epithelium which surrounds the mantle. This epithelium secretes from the outside normally, mother-of-pearl, and abnormally, the pearl The determining factor in the formation of a pearl is not the presence of a foreign body in the interior of the oyster, but the epithelial cells in the subepidermal tissues of the mantle. These living epithelial cells are capable of secreting the nacreous matter. Nuclei which enter the body of the oyster without carrying a particle of the living epithelium will not cause the development of a pearl In cases where the irritant or nucleus is directly attached to the epithelium of the mantle, the oyster envelopes it with a covering of epithelial cells, forming a sac, which is then coated with successive layers of nacre to produce the pearl. "Natural" pearls are found which contain no central nucleus, and Dr. Alverdes and K. Mikimoto independently, by transplanting small sections of the living epithelium cells of one oyster into another, demonstrated the development of pearl matter, but such pearls were very irregular in shape, and entirely free from nucleus.

The Oysters Employed.—The finest pearls are developed by the strongest oysters, obtained by the Japanese by careful breeding and repeated examination for disease during growth The oyster spawn is collected, and when old enough the young oysters or "spats" are placed in fine meshed cages in order to protect them from the attacks of star fish, octopuses or other enemies, and are lowered into the sea. Cleansing of the cages is necessary, and the oysters themselves are frequently examined for disease; at the age of two they are transferred into a wider meshed cage and returned to the sea. When they are three years old, the age of maturity, the oysters are operated upon for pearl development. The shell of one oyster is removed, and a small spherical bead of mother of pearl is placed on the outside of the secreting epithelium of the mantle. This epithelium is then dissected from the oyster, and drawn over the mother of pearl nucleus so as to form a sac, which is ligatured at one end. The sac is next taken from the oyster, and grafted into the sub-epidermal tissues of a second oyster; the ligature is removed, and after treatment of the wound with astringents, the second oyster is placed in a cage, and finally returned to the sea. During the next seven years the oyster continues the secretion of the nacreous layers upon the mother-of-pearl nucleus, and development proceeds exactly as in the formation of a "natural" pearl. Supervision is maintained during this period, and finally the oysters are opened for the extraction of the "cultured" pearls. Approximately sixty per cent of the oysters operated upon yield pearls, but owing to the irregularity in shape, due to uncontrollable factors in their development, those of marketable value are only about 5%.

Distinction Between Cultured and Natural Pearls.—Pearls of culture generally possess a finer structure than those of accidental growth. This is due to the smaller amount of organic matter which is consumed and secreted by the oysters, which live in well-cleaned cages. "Natural" pearls contain on an average two per cent of water, but those of "culture" contain less than this, an important factor after the pearl has dried out. Several attempts have been made to distinguish between pearls of "culture" and "natural" pearls X-rays and X-ray photography failed. Professor Cox and Dr. Lyster Jameson studied the effect of polarized light without success. Ultra-violet rays at first appeared more successful, as pearls of "culture" gave a different coloured transparency from "natural" pearls fished from the waters either of India or of Australia. Finally it was found that the method would only indicate the locality in which the pearls were developed. The only method of ascertaining which variety is "cultured" and which "natural" is to cut the pearl and examine the cross section. In the case of the former the mother-of-pearl bead can be observed

PEARL, THE. The Middle-English poem known as "Pearl" or "The Pearl" is preserved in the unique ms Cotton Nero Ax at the British Museum; in this volume are contained also the poems "Cleanness," "Patience," and "Sir Gawayne and the Green Knight." All the pieces are in the same handwriting, and from internal evidences of dialect, style and parallel references, it is now generally accepted that the poems are all by the same author One other alliterative poem, "Sir Erkenwald," may be assignable to him. The ms, which is quaintly illustrated, belongs to the end of the 14th or the beginning of the 15th century.

"Pearl" is a poet's lament for the loss of a girl-child, "who lived not upon earth two years"; the poet is evidently the child's father In grief he visits the little grave, and there in a vision beholds his Pearl, now transfigured as a queen of heaven—he sees her beneath "a crystal rock," beyond a stream; the dreamer would fain cross over, but cannot. From the opposite bank Pearl, grown in wisdom as in stature, instructs him in lessons of faith and resignation, expounds to him the mystery of her transfiguration, and leads him to a glimpse of the New Jerusalem. Suddenly the city is filled with glorious maidens, who in long procession glide towards the throne, all of them clad in white, their robes pearl-bedecked like Pearl herself. There he sees, too, "his little queen." A great love-longing possesses him to be by her. He must needs plunge into the stream that sunders him from her In the very effort the dreamer awakes, to find himself resting upon the mound where his Pearl had "strayed below"

"While the main part of the poem," according to Gollancz, "is a paraphrase of the closing chapters of the Apocalypse and the parable of the Vineyard, the poet's debt to the *Romaunt of the Rose* is noteworthy, more particularly in the description of the wonderful land through which the dreamer wanders; and it can be traced throughout the poem, in the personification of Pearl as Reason, in the form of the colloquy, in the details of dress and ornament, in many a characteristic word, phrase and reference. 'The river from the throne,' in the Apocalypse, here meets 'the waters of the wells' devised by Sir Mirth for the Garden of the Rose. From these two sources, the Book of Revelation, with its

almost Celtic glamour, and *The Romaunt of the Rose,* with its almost Oriental allegory, are derived much of the wealth and brilliancy of the poem. The poet's fancy revels in the richness of the heavenly and the earthly paradise, but his fancy is subordinated to his earnestness and intensity."

Leading *motifs* of "Pearl" are to be found in the Gospel—in the allegory of the merchant who sold his all to purchase one pearl of great price, and in the words, so fraught with solace for the child-bereft, "for of such is the Kingdom of Heaven." Naturally arising from the theme, and from these *motifs,* certain theological problems of the time are treated perhaps too elaborately.

The poem consists of 101 stanzas, each of 12 lines, with four accents, rhymed *ab, ab, ab, ab, bc, bc;* the versification combines rhyme with alliteration; trisyllabic effects add to the easy movement and lyrical charm of the lines. Five stanzas (in one case six), with the same refrain, constitute a section, of which accordingly there are 20 in all, the whole sequence being linked together by the device of making the first line of each stanza catch up the refrain of the previous verse, the last line of the poem re-echoing the first line. The author was not the creator of this form, nor was he the last to use it.

By piecing together personal and other indications to be found in the poems an imaginary biography of the unknown poet may be constructed. It may be inferred that he was born about 1330–40, somewhere in Lancashire, or a little to the north; that he delighted in open-air life, in woodcraft and sport; that his early life was passed amid the gay scenes that brightened existence in mediaeval hall and bower; that he availed himself of opportunities of study, theology and romance alike claiming him; that he wedded, and had a child perhaps named Margery or Marguerite —the Daisy or the Pearl—at whose death his happiness drooped and life's joy ended.

It is noteworthy that soon after 1358 Boccaccio wrote the Latin eclogue "Olympia" in memory of his young daughter Violante. A comparative study of the two poems is full of interest; the direct influence of the Latin on the English poem is doubtful, although "Pearl" may be later than "Olympia."

Gollancz, *Select Early English Poems* (1922); Facsimile of ms. Cotton Nero Ax (E.E.T.S., 1923); *Cambridge History of English Literature,* vol. i. ch. xv. (bibl.). (I. G.)

PEARSALL, ROBERT LUCAS DE (1795–1856), English composer, was born on March 14, 1795, at Clifton. He produced many works of lasting beauty, nearly all of them for voices in combination: from his part songs, such as "Oh, who will o'er the downs?" to his elaborate and scholarly madrigals, such as the admirable eight-part compositions, "Great God of Love" and "Lay a Garland." He died on Aug. 5, 1856.

PEARSE, PATRICK HENRY (1879–1916), Irish leader and poet, was born in Dublin on Nov. 10, 1879. Educated at the Christian Brothers schools and the Royal University of Ireland, he became editor of the *Claidheamh Soluis,* the weekly organ of the Gaelic League. He was secretary to the publication committee of the League and an energetic member of its executive. After touring Belgium to study bilingual methods, he published several *Fiana,* tales from Irish manuscripts. Pearse's chief interest was education and he approved Birrell's Irish Education Bill, as it gave the Irish control over their own education. He founded St. Enda's school at Cullenswood, Dublin, moving it in 1910 to the Hermitage, Rathfarnham. After a tour in America, Pearse joined the Irish Volunteer Movement and was commander-in-chief of the Irish forces in the rebellion of 1916. On April 30, 1916, he sent out an order to his troops to surrender. He himself was arrested and executed on May 3, 1916.

See his *Life* by Desmond Ryan (1919).

PEARSON, SIR CYRIL ARTHUR (1866–1921), British newspaper proprietor, was born at Wookey, near Wells, Feb. 24, 1866, and was educated at Winchester. He early founded the business of C. Arthur Pearson, Ltd., newspaper proprietors and publishers; and after making large profits with *Pearson's Weekly* and other periodicals he founded in 1900 *The Daily Express,* a halfpenny rival to *The Daily Mail.* In 1904 he purchased *The Standard* with *The Evening Standard.* He was a strong supporter of Mr. Chamberlain's tariff reform movement, and was vice-president of the Tariff Reform League and vice-chairman of the Tariff Commission of 1903. In 1905 he amalgamated *The Evening Standard* with *The St. James's Gazette* which he had bought a few months previously. In 1910 increasing—later complete—failure of sight obliged him to retire from the active direction of newspapers. Henceforth he devoted himself and his fortune with whole-hearted industry to efforts to ameliorate the condition of the blind. During the World War he established at his house, St. Dunstan's, in Regent's Park, London, a hospital for blinded soldiers, and became chairman of the Blinded Soldiers' and Sailors' Care Committee (1914). He also became president of the National Institution for the Blind. He was created a baronet in 1916 and G.B.E. in 1917. Sir Arthur died in London on Dec. 9, 1921.

PEARSON, JOHN (1612–1686), English divine and scholar, born at Great Snoring, Norfolk, on Feb. 28, 1612, studied at Queen's College, Cambridge, and became a fellow of King's and a weekly preacher at St. Clement's, Eastcheap, in London. In 1659 he published in London his famous *Exposition of the Creed* (*see* the ed. by Burton, 1883), *Chevalier* (1849) and *Sinker* (1882) and his *Golden Remains of the ever-memorable Mr. John Hales of Eton,* with an interesting memoir. In 1662 he was made master of Trinity college, Cambridge. In 1667 he was admitted F.R.S. His defence of the authenticity of the letters of Ignatius in his *Vindiciae epist. S. Ignatii* (1672) was confirmed by J. B. Lightfoot and other recent scholars. In 1672 Pearson was appointed to the bishopric of Chester. In 1682 his *Annales cyprianici* were published at Oxford, with John Fell's edition of the works of Cyprian. He died at Chester on July 16, 1686. His last work, the *Two Dissertations on the Succession and Times of the First Bishops of Rome,* formed with the *Annales Paulini* the principal part of his *Opera posthuma,* ed. H. Dodwell (1688).

See memoir by E. Churton, prefixed to the edition of Pearson's *Minor Theological Works* (2 vols., 1844). Churton also edited most of the theological writings.

PEARSON, JOHN LOUGHBOROUGH (1817–1897), English architect, son of William Pearson, etcher, of Durham, was born in Brussels on July 5, 1817. He was articled at 14 to Ignatius Bonomi, architect, of Durham, and afterwards worked under Anthony Salvin and Philip Hardwicke in London. He revived and practised with great proficiency the art of vaulting, though he was by no means a Gothic purist; he also followed Renaissance and classical models. From the erection of his first church of Ellerker, in Yorkshire, in 1843, to that of St. Peter's, Vauxhall, in 1864, his buildings are Geometrical in manner and characterized by elegance of proportion and refinement of detail. His best known work is Truro cathedral (1880), incorporating the south aisle of the ancient church.

Pearson's conservative spirit fitted him for the reparation of ancient edifices, and among cathedrals and other buildings placed under his care were Lincoln, Chichester, Peterborough, Bristol, and Exeter cathedrals, St. George's chapel, Windsor, Westminster Hall and Westminster Abbey. In the surveyorship of the last he succeeded Sir G. G. Scott. Except for porches, the work of Scott, he re-faced the north transept of Westminster Abbey, and designed the organ cases. He was elected A.R.A. in 1874, R.A. in 1880, was a fellow of the Society of Antiquaries, and a fellow and member of the council of the Royal Institute of British Architects. He died on Dec. 11, 1897, and was buried in the nave of Westminster Abbey.

See *Archit. Review,* vol. i. (1897); *Royal Inst. of Brit. Architects Journal,* v. 113 (1897–98).

PEARSON, KARL (1857–), British mathematician, was born in London in 1857, and educated at University college school and at King's college, Cambridge. He was called to the bar in 1882, and afterwards became an authority on the science of eugenics. He was subsequently appointed Galton professor of eugenics at London university and director of the Francis Galton laboratory for national eugenics. He was awarded the Darwin Medal of the Royal Society, of which he was elected fellow in

1896, for his numerous contributions to the mathematical theory of evolution and heredity.

Professor Pearson was the editor of *Biometrika* from 1902–24, and of *The Annals of Eugenics* (1925–26), and his other publications include *The Ethics of Free-thought* (1887, 1901); *The Chances of Death, and other Studies in Evolution* (1897); *Grammar of Science* (1899, 1900, 1911); *National Life from the Standpoint of Science* (1901); *Tables for Statisticians* (1914–24); *The Life, Letters and Labours of Francis Galton* (1915–25).

PEARY, ROBERT EDWIN (1856–1920), American Arctic explorer, was born at Cresson, Pa, on May 6, 1856 In 1877 he graduated at Bowdoin college. He was made a lieutenant in the U.S. navy in 1881, acting as civil engineer and was assistant-engineer in the Nicaragua ship canal surveys in 1884, becoming their director in 1887–88 In 1886, however, he also made a study of the west coast of Greenland, in the region of Disco bay, with reference to its use as a base for polar exploration In 1891 the Philadelphia Academy of Natural Sciences put him in charge of a polar expedition of seven, including his wife. Inglefield gulf, on the north-west coast of Greenland, was the base In the spring of 1892 he went, with the Norwegian Eivind Astrup, to the north-east coast, thereby proving that Greenland is an island The Cape York (Smith sound) Eskimos, the most northerly people in the world, were also studied. This expedition was described by Mrs. Peary in *My Arctic Journal.* In the following year he organized another expedition, also from headquarters in Inglefield gulf, where Mrs. Peary gave birth to a daughter. In 1894 Peary, Matt Henson, the negro member of the expedition, and Hugh Lee, were left alone and again crossed to the east coast In the summer three meteorites, which the Eskimos used in making their iron implements, were found These had been reported in 1818 by Sir John Ross All were eventually brought to the United States In 1898 Peary described his work to date in *Northward Over the Great Ice* In that year also, with the support of the Peary Arctic Club and Morris Jesup, he started on a four year's exploring schedule He used Eskimos in this expedition, which demonstrated, in 1900, that Greenland is bounded on the north by the polar ocean; the north coast of the island was surveyed. In 1902 Peary, with Henson and an Eskimo, advanced as far north as lat 84° 17′ 27″, the highest point then reached in the Western Hemisphere. Lieut Peary had now been promoted to the rank of commander, and on his return he was elected president of the American Geographical Society In Nov 1903 he went to England on a naval commission to inquire into the system of naval barracks in Great Britain, and was presented with the Livingstone Gold Medal of the Royal Scottish Geographical Society Commander Peary then began preparations for another expedition by the construction of a special ship, named the "Roosevelt," the first ever built in the United States for the purpose of Arctic exploration. He sailed from New York on July 16, 1905, having two years' supplies on board. The "Roosevelt" wintered on the north coast of Grant Land, and on Feb 21 a start was made with sleds The party experienced serious delay owing to open water between 84° and 85°, and farther north the ice was opened up during a six days' gale, which cut off communications and destroyed the dêpots which had been established A steady easterly drift was experienced But on April 21, 1906, 87° 6′ was reached—the "farthest north" attained by man—by which time Peary and his companions were suffering severe privations, and had to make the return journey in the face of great difficulties. In 1907 the narrative of his journey, *Nearest the Pole,* was published

In 1908 Peary started in the "Roosevelt" on the journey which was to bring him his final success as the discoverer of the North Pole. He left Etah on Aug 18, wintered in Grant Land, and set forward over the ice from Cape Columbia on March 1, 1909 A party of six started with him, and moved in sections, one in front of another. They were gradually sent back as supplies diminished At the end of the month Capt. Bartlett was the only white man left with Peary, and he turned back in 87° 48′ N, the highest latitude then ever reached. Peary, with Henson and four Eskimos, pushed on, and on April 6, 1909 reached the North Pole. They remained some 30 hours, took observations, and on sounding, a few miles from the pole, found no bottom at 1,500 fathoms. The party, with the exception of one drowned, returned safely to the "Roosevelt," which left her winter quarters on July 18, and reached Indian Harbour on Sept. 5 Peary's *The North Pole: Its Discovery in 1909* was published in 1910

In 1911 he was given the rank of rear-admiral and delegated to the International Polar Commission in Rome. In addition to the works already mentioned he wrote, *The North Pole* (1910) and *Secrets of Polar Travel* (1917). He died in Washington, D.C on Feb 20, 1920.

See Fitzhugh Green, *Peary, the Man Who Refused to Fail* (1926). (R. E. B.)

PEASANT, a countryman, either working for others, or owning or renting and working by his own labour a small plot of ground (Fr. *paysan;* Lat *pagensis,* belonging to the country). (*See* ALLOTMENTS and METAYAGE)

PEASANT MOVEMENT. The World War gave a strong impetus to the political consciousness of a class which had seemed obliterated since the Industrial Revolution During the past century the peasants, even in western Europe, have been dominated by commerce and industry. In eastern Europe they have had no share in public life, except in sporadic risings. Yet in eastern Europe they form the bulk of the populations, and it is naturally in that region that the new peasant movement is asserting itself

Political Traditions of the Peasantry.—From the French Revolution till 1848 the peasants of western and central Europe were gradually freed from all their feudal servitudes The peasants themselves played only an indirect rôle in that emancipation, which was due mainly to the efforts of the urban middle classes, acting under the stimulus of political, economic and social motives.

The political division between town and country was later widened into a gulf by scientific Socialism The angle of Socialist economics was essentially the same as that of Liberalism, except that what the latter regarded as economically well established Socialism looked upon as merely transitory, so that its own heaven was even more remote from the peasant world The peasant holding and tilling land on a small scale was doomed M Vandervelde said (in 1898) that to wish to realise the ideal of the Biblical homestead was as futile as to try "to replace the *Code Napoléon* by the tables of Moses" And not only futile but also pernicious; Marx praised capitalism for having at least rescued "a considerable part of the population from the idiocy of rural life" Hence he and his disciples placed the nationalisation of land and farming on a large scale for public account in the forefront of their programme From that time date the many Conservative agrarian organisations in central and western Europe which found in the peasants credulous recruits; a circumstance whose electoral effects gradually led to a watering down of Socialist agrarian programmes

Populism.—The economic and political incentives which had harnessed the western bourgeoisie to the task of rural emancipation had then little meaning in the eastern half of the Continent. Politically that region was still in the autocratic stage; and its economic structure rested on a primitive agriculture and on artisan manufacture—capitalist industry being altogether absent. But the third, social incentive stirred up reformers in the east if anything more deeply than in the west. In Russia the Slavophil revival had raised the peasant on a pedestal, and that only made his serf's chains more obnoxious in the eyes of the *intelligentsia* The younger intellectuals, imbued with 18th century humanitarian philosophy, centred all their ideals on freeing the peasants But whereas to western Liberals that had been an end in itself, for the Russian reformers it was merely the stepping-stone to an independent and prosperous village life They prided themselves in being Socialists, but, like Proudhon's, theirs was a Socialism for the peasants Marxism was essentially an industrial policy for the transformation of industrial societies The eastern reformers were forced to form alternative conceptions and programmes suited to the problems of their peasant populations "Populism" (*narodnichestvo,* from *narod*—people) became the expression of that current of opinion. (*See* RUSSIA, HISTORY)

The kernel of the Populist position was the rejection of the Marxian economic determinism. Marxism considered a phase of capitalist concentration of production as the inevitable prelude to a Socialist society; the Russian Populists, basing themselves on the existence of the *mir*, contended that the capitalist-proletarian phase was not necessary in Russia, nor even possible in such backward agrarian countries. For capitalism would ruin the peasants, *i.e.*, the only available customers for industrial products. Likewise the Populists held that revolutionary leaders were able to shape and guide events, provided that they acted in line with the needs and wishes of the masses. Above all they believed that a rural democracy offered the masses a better promise of happiness than they could expect from an industrial organisation. All they needed was more "Land and Liberty"; and the backbone of the Populist programme was a plea for equal distribution of land among the peasants.

The later exponents of this policy were the Social-Revolutionaries who were the strongest party of the Left till the Bolshevik Revolution. That the Populist doctrine had its roots in the natural conditions of the region is proved by the way it spread to the other agrarian countries of eastern Europe. It was perhaps natural that Serbia and Bulgaria should come under its influence, as both countries stood in close intellectual dependence on Russia. The decisive test is supplied by Rumania—a Latin country, strongly averse to Slav influence; yet there also the new doctrine engendered the able Poporanist (*popor*, people) current, which together with the other groups never ceased denouncing Marxism. (*See* D. Mitrany, *Marx and the Peasant*, in "London Essays in Economics in Honour of Edwin Cannan.")

The Peasant Renascence.—The Populist movement had remained largely theoretical. In the region in which it was born the peasants were kept under by a rigid political and social tutelage. Political activity among them, and claims for the distribution of land, were treated as revolutionary. The only outlet for their grievances was occasional risings, like those of 1905 in Russia and 1907 in Rumania, which were mercilessly repressed. The World War and the Russian Revolution produced great changes. Sweeping agrarian reforms have transferred the land to the peasants, giving them potential economic independence and reducing in the same degree the influence of their former task-masters. In most of the countries concerned they have at the same time secured full political franchise. And everywhere they have been roused to a consciousness of their interests and of their power as a class. As a consequence powerful Peasant Parties have sprung up in all the countries of eastern Europe in which government is representative. The movement is yet in its infancy; its possibilities reside in the facts that more than half the population of the globe lives in the typically peasant "family economy," and that of the hundred million European voters some 60–70 million are peasants, as against some 20 million industrial workers.

Doctrine and Programme.—Unlike Socialism, which had a fully developed doctrine before it had an organised following, the Peasant Movement has sprung up suddenly and separately in the various countries, though out of similar convulsive events. Hence its sociology is in the making, and the programmes of the several Parties, which hitherto have had little contact with each other, show substantial variations. Essentially it is of course an agrarian movement; but its philosophy and policy are eclectic, having taken over and adapted to its own use elements from all the three chief political divisions—from Conservatism and Liberalism as well as from Socialism. Its fundamental standpoint is a bias for a rural society, based on small peasant property.

The radicalism of the eastern Peasant Movement is due to peculiar conditions in that region. Whereas in the west agrarian parties were a mixture of all rural classes, with the big landowners predominant, as in the German *Landbund*, the new Peasant Parties are exclusively peasant. Secondly, the oppression of the peasantry in the east has till now prevented the growth of a peasant middle class, so that the movement is carried more uniformly by a mass of small peasants. Thirdly, the general peasant antagonism towards towns and capitalists has different effects in the two halves of Europe: in the west finance and industry are moving fast into a phase of international organisation, by means of cartels, trusts, etc., and the outlook of the towns is cosmopolitan; as a reaction the countryside is Conservative and nationalist. In the east the towns, industry and finance concentrate the essence of local nationalism, and the peasantry which has to pay the bill of protectionism, etc., favours in consequence a Liberal and even Radical policy in all respects. Fourthly, in the industrialised States agriculture produces mainly for the home market and is anxious to be protected in it; the peasants produce mainly for themselves with a surplus for export, and desire free trade.

National Organisations.—The new Peasant movement is peculiar to the eastern half of Europe. In the industrialised countries of the west, and even in Holland and Denmark, the peasants have been drawn into agrarian Conservative parties, as a result of a general agrarian antagonism to industry and finance, partly through clerical influence, and largely by the effective use of the Socialist demand for land nationalisation as a bogey. But just as western Socialism has stirred up industrial groups in the east and shaped their outlook, so the eastern Peasant Movement is bound to react upon peasant groups in the west. In France a Peasant Party was founded four weeks before the elections of 1928; none of its three candidates was elected, but the Party secured 80,000 votes and is actively organising itself. In Germany, likewise before that year's elections, the left wing of the old *Landbund* formed the new Christian National Peasant Party and gained 13 seats in the Reichstag. At the same time the Bavarian *Bauernbund* transformed itself into a German Peasant Party; it secured 8 seats in the Reichstag and dominates the parliamentary situation in Bavaria. The formation of a joint Peasant group in the Reichstag is foreshadowed. An attempt to establish a Peasant Party is also being made in Holland.

Some of the eastern Peasant Parties were founded before the World War, but became important only after its end. Most countries have only one Party, but in Poland and other States bordering on Russia the chaos of the revolution is still reflected in a continuous splitting-up and reshuffling of political groupings. In the following list figures refer to 1928 except when otherwise stated.

Bulgaria.—"Agrarian Union," founded 1899 as a professional body, became political in 1901. It polled in 1911 14·45% of the votes cast, 31% in 1919, 38·16% in 1920 and 52% in 1923. In June 1923 there was a military rising; Stamboliski and other Party leaders were murdered. At the following elections 26·8% of the votes, 33 deputies: the Party is recovering, but suffers from lack of leaders. In power from 1919 to 1923, it carried through considerable co-operative developments, also the law for compulsory service (*see* Int. Labour Office pamphlet, Legislative Series 1920), which is still in force.

Czechoslovakia.—"Republican Party of Farmers and Small Peasants." Founded in 1896; first Conservative, veered towards the Left. Polled 603,618 votes in 1920 and 970,498 in 1925 in the Czech territories alone. Its leader has been in office since the establishment of the Republic; since 1922 Antonin Svehla has presided over two Coalition Governments. The Slovak, Dr. Milan Hodža, Minister of Education, is the most forceful exponent of the new movement. Czechoslovakia is the only country to have adopted the eight hours' day for agriculture, also the only one of the eastern countries to have included members of the Minorities in the Cabinet; both measures due to the Party's initiative.

Estonia.—"Peasant Party," founded after the war. 1926 election: 25 members of parliament. Leader Jaan Teemant is president and premier of the State. The Settlers' Party has 14 members of parliament, two leaders in the cabinet; represents the interests of the recently impropriated peasants.

Finland.—"Peasant League": in 1924 had 44 members of parliament, 1927 rose to 52. Leader, Dr. Relander, is premier of the Coalition Government.

Hungary.—"Small Farmers' Party": made promising begin-

ning, but the introduction of open balloting in country districts has checked all political activity on the land.

Latvia.—There are three Centre groups: Peasants' Union with 16 deputies, Latgallian Catholic and Christian Peasants with 5, and Latgallian Peasants with 2 deputies; and three groups of varying Leftward shades: Agrarian Settlers with 3, New Farmers and Small Peasants with 3 and Latgallian Peasant-Labour Party with 2 deputies. They differ mainly in regard to land reform and in their bias for closer relations with the west or with Russia.

Lithuania.—Before the recent coup d'état the Peasant Union had 11 members of parliament.

Poland.—Polish Peasant Parties have been in a continuous state of flux, largely for personal reasons. "Piast," formerly the strongest, now has only 28 deputies; its leader, Vincent Witos, has been twice premier; it is Conservative, admits land reform only against full compensation and is open to Clerical influences. "Wyzwolenie" secured 38 seats at the last election; Jan Dabsky, its leader, is vice-president of the chamber; it is radical, demands land reform without indemnity, regional autonomy for the minorities; it also is anti-clerical. A similar programme is supported by "Stronnictwo Chlopskie," with 25 deputies, representing the small peasants. The "Stapinski" Peasant Party has 3 members and the extreme Radical Peasants' Club has one member in parliament. It is noteworthy that while the political movement is divided by regional, clerical and personal influences, the peasants generally work together in each locality in their co-operative affairs.

Rumania.—The "National Peasant Party"; formed of the fusion two years ago of the Peasant Party and of the National (Transylvanian) Party, has been able to assert itself as the only substantial Opposition in spite of elaborate "doctoring" of elections. It has now about 40 members in the Chamber, but its strength in the country is dominant. Of the leaders, Vaida-Voevod has once held office as premier, and Mihalache, Popovici, etc. have held cabinet positions. The Party secured power in November 1928 and formed the first truly parliamentary government in Rumania.

Yugoslavia.—The "Croatian Peasant Party," founded in 1904, had 3 deputies in 1908, 49 in 1920 and 60 in 1923. It dominates in Croatia and is gaining strength in Herzegovina and Dalmatia. Of the leaders, Stephen Radić, Pavle Radić (recently murdered) and three others have held cabinet office in Coalition Governments. Remarkable for its organisation, and especially for its spiritual strength, it is the only Peasant Party to have been founded in furtherance of a rural creed rather than of agrarian interests, by the brothers Radić (Dr. Ante Radić having previously done original work in rural sociology).

International Organisation.—A number of international agrarian organisations have existed before the war or were formed after it, but of these none had the two distinguishing characteristics of being limited to truly Peasant groups and of being established for political action. Three attempts have been made to set up an international body on these lines:

(1) Soon after the war an attempt was made by Bavarian and Austrian agrarians to join up the Peasant groups of central Europe, the Bavarian Dr. Heim being one of the initiators. The tendency was strongly Conservative, anti-Bolshevik (in this being included all the democratic influences coming from Berlin); and while some of the leaders kept neutral, others had a strong clerical bias. The attempt never materialised.

(2) Though no Peasant Party exists, or would be allowed, in Russia, the Soviets encouraged some of the refugees living in Moscow to set up a Peasant International there. Formed in 1923, it held its first Congress in 1925. It has made no visible impression on the Peasant movement.

(3) On the initiative of the Bulgarian Stamboliski an international agrarian bureau was established in Prague in 1921, the Czech, Bulgarian, Polish and Serbian Peasant Parties being its members; purely for research and information. In May 1928 the organisation was widened, being joined by the Croatian, Rumanian and other Peasant Parties, including the newly-formed French and Dutch Parties. Eight Parties of central and eastern Europe have in addition formed a regional group within the bureau, to act politically in close contact, with a joint central executive. The group, like the bureau, is to work for the solution of political and social problems according to peasant interests; it is to publish in one or more of the western languages the chief writings of Peasant leaders, and prepare a peasant news agency. The regional group was formed especially to resist jointly any attempt at dictatorship, whether from the Left or from the Right.

(D. Mi.)

PEASANT PROPRIETOR: *see* Land Tenure.

PEASE, EDWARD (1767–1858), the founder of a famous industrial Quaker family in the north of England, was born at Darlington on May 31, 1767, the son of Joseph Pease (1737–1808), a woollen manufacturer. Edward Pease made the acquaintance of George Stephenson, and with him took a prominent part in constructing the railway between Stockton and Darlington. He died at Darlington on July 31, 1858.

His grandson, Joseph Albert Pease, Lord Gainford (b. 1860), entered parliament in 1892, was junior Liberal Whip (1897–1905), a lord of the treasury (1905–10), chancellor of the duchy (1910–11), president of the board of education (1911–15), and postmaster-general (1916).

PEAT, a product of decayed vegetation found in the form of bogs in many parts of the world. The principal areas of the peat deposits of the world are as follows:—

Russia	65,000 square miles
Canada	37,000 ,, ,,
Finland	30,000 ,, ,,
Sweden	19,000 ,, ,,
United States	11,200 ,, ,,
Germany	9,900 ,, ,,
Great Britain	9,400 ,, ,,
Ireland	4,700 ,, ,,
Newfoundland	3,000 ,, ,,
Norway	2,900 ,, ,,
Austria	1,500 ,, ,,
Denmark	400 ,, ,,

The plants which give origin to these deposits are mainly aquatic, including reeds, rushes, sedges and mosses. *Sphagnum* is present in most peats, but in Irish peat *Thacomitrum lanuginosum* predominates. It seems that the disintegration of the vegetable tissues is effected partly by moist atmospheric oxidation and partly by anaerobic bacteria, yeasts, moulds and fungi, in depressions containing fairly still but not stagnant water, which is retained by an impervious bed or underlying strata. As decomposition proceeds the products become waterlogged and sink to the bottom of the pool; in the course of time the deposits attain a considerable thickness, and the lower layers, under the superincumbent pressure of the water and later deposits, are gradually compressed and carbonized. The most favourable conditions appear to be a moist atmosphere, and a mean annual temperature of about 45° F: no bogs are found between latitudes 45° N. and 45° S. The peat bogs of Great Britain vary in thickness from 5 to 30 ft.; and those of North America from 5 to 25 ft.

Peat varies from a pale yellow or brown fibrous substance, resembling turf or compressed hay, and containing conspicuous plant remains, to a compact dark brown material, resembling black clay when wet and some varieties of lignite when dry. Two typical forms may be noticed: "Hill peat" (the mountain or brown bogs of Ireland), found in mountainous districts, and consisting mainly of *Sphagnum* and *Andromeda*; and "Bottom peat" (the lowland or red bogs of Ireland), found in lakes, rivers and brooks, and containing *Hypnum.* The latter kind always contains much water, up to 90%, which it is necessary to remove before the product can be efficiently employed as a fuel, and for most other purposes. A specimen dried at 100° C had the following composition: carbon, 60·48%; hydrogen, 6·10%; oxygen, 32·55%; nitrogen, 0·88%; ash, 3·30%; the ash is very variable—from 2 to 15% and even more—and consists principally of clay and sand, with lesser amounts of ferric oxide, lime, magnesia, etc. On air-drying the peat loses from 8 to 20% of its moisture. In a good, dry season peat may be air-dried down to 17 or 18% moisture, while under moderate conditions it may be saved with 25 to 30%

moisture. Average air-dried peat containing 25% moisture may be taken as having a calorific value of about 6,000 B.T.U. The specific gravity has been variously given, owing to the variable water content and air spaces; when dried and compressed, however, it is denser than water. The yield per sq.km. (0·386 sq.m.) for a depth of five metres (16·4 ft.) has been determined in Germany as approximately 800,000 tons of air-dried peat.

Peat-winning presents certain special features. The general practice is to cut a trench about 1 ft. deep with a peculiarly shaped spade, termed in Ireland a "slane," and remove sods from 3 to 4 ft. long. When one layer has been removed, the next is attacked, and so on. If the deposit be more solid step-working may be adopted, and should water be reached recourse may be had to long-handled slanes. The sods are allowed to drain, and then stacked for drying in the air, being occasionally turned so as to dry equally; this process may require about six weeks.

Machine Working.—Mechanical power has been applied, especially in Sweden and Germany, to the winning of peat, the operations involved being:—(1) The excavation and elevation of the raw peat from the bog. (2) The maceration and mixing of the raw peat by means of rotating and fixed knives and a single or double screw conveyor which forces the peat through a nozzle or nozzles in a stream which is cut into lengths for sods. (3) The transport of the formed sods and their deposition on the bog. (4) The collection and stacking of the air-dried peat. In the most recent German practice the operations indicated in (1) (2) and (3) are combined in one machine electrically driven.

Several processes have been invented for the carbonization of peat and recovery of the by-products. Among these is the Ziegler process which is, or was, in operation at Oldenburg in Germany, Rodkino in Russia and Beuerberg in Bavaria The uncondensed gases from the coking plant at Beuerberg gave:—

Carbon dioxide	15·5 per cent
Oxygen	1·1 „ „
Carbon monoxide	20·4 „ „
Methane and other hydrocarbons	12·4 „ „
Hydrogen	28·6 „ „
Nitrogen	21·9 „ „
	99·9

The "coke" contained:

Carbon	73·89 per cent
Hydrogen	3·59 „ „
Oxygen	14.52 „ „
Nitrogen	1·49 „ „
Sulphur	0·20 „ „
Ash	2·50 „ „
Moisture	3·80 „ „
	99·99

and the calorific value of the semi-coke was 12,000 B.T.U. The volume of the gases amounted to 6,759 cu.ft. per ton.

The results of working the process are stated to have been as follows:—

	Per 100 tons of air-dried peat
Ammonium sulphate	900 lb.
Acetate of lime	1,320 „
Methyl alcohol	65 gal.
Light oils	280 „
Heavy oils	95 „
Paraffin	715 lb.
Creosote	3,100 „
Asphalt	40 „

The manufacture of producer gas from peat, in regard to which a number of methods exist, mostly based on the Mond process, has proved more or less successful. The briquetting of peat has also been carried out. The briquettes contain approximately 18% of moisture and are said to yield a high quality charcoal. One of the chief factors operating against the commercial success of peat as a fuel in competition with coal and other fuels has been the cost of drying the peat. With the recently introduced "Peco" process it is claimed however that the peat can be dried down to 10% moisture and that 65% of the peat is recovered, that is to say in order to produce from 100 tons of raw peat 65 tons of dry peat, 35 tons of the raw peat are absorbed in drying. Perhaps Ireland is the largest producer with an output in the neighbourhood of 6,000,000 tons annually of air-dried peat.

See *The Winning, preparation and use of peat*, by the Fuel Research Board (1921); *The Utilization of Peat Fuel*, Department of Mines, Canada (1912). (R. R.)

PEBA, a name for the nine-banded armadillo. (*See* ARMADILLO.)

PEBAN, a group of tribes of South American Indians somewhat doubtfully to be regarded as constituting an independent linguistic stock. The Pebas (who have given their name to the group), the Yameos, and Yaguas, who form the stock, are located on the northern side of the Amazon in the region of the Brazilian-Peruvian border.

See C. F. P. von Martius, *Beiträge zur Ethnographie und Sprachenkunde Amerikas, etc.* (Leipzig, 1867).

PEBBLE WRITING. From the very earliest times to which the energy of man can be traced, date two kinds of writing: (*a*) engraving of a visible object on some hard substance, such as the flat surface of a bone; (*b*) drawing, painting, or engraving marks which could again be identified. Of the first kind are the engravings of reindeer, buffaloes, and other animals by the cave men of prehistoric times; of the second are a large number of pebbles discovered by M. Ed. Piette at Mas d'Azil, on the left bank of the Arize, intercalated between the last layer of the Reindeer age and the first of the Neolithic period. The stones were coloured with peroxide of iron. The characters are of two kinds: (*a*) a series of strokes which possibly indicate numbers, (*b*) graphic symbols. The stones were scattered about without connection or relation one with another. Whatever the meaning may be, it is clear that the markings are not accidental. It has been suggested that, like similar things among the American Indians, they may have been used in playing games or gambling.

PECAN, a North American species of hickory (*q.v.*) valued for its timber and its edible nuts, called pecans, which are commercially cultivated in several Southern States. (*See* NUT.)

PECCARY, the name given to the New World representatives of the swine (*Suidae*), from which they may be distinguished by the fact that the upper canine teeth (tusks) are directed downwards, and by other peculiarities of the teeth, stomach and feet. Peccaries range from New Mexico and Texas to Patagonia. The collared peccary (*Dicotyles tajacu*) is a dark grey animal with a white band across the chest from shoulder to shoulder. It is about 3ft. long, living in small herds of eight to ten, and has an extensive range in S. America. The white-lipped peccary (*D. labiatus*) is about 6in. longer, blackish in colour, with white lips. Peccaries form the sub-family *Dicotylinae* of the *Suidae* (*see* ARTIODACTYLA and SWINE). Extinct peccaries are known as far back as the Miocene in North America, but only in superficial deposits in the southern continent. This indicates that the group entered North America in the Upper Oligocene and subsequently reached their present habitat.

PECHORA, a river of North Russia, which rises in the Urals, almost on lat. 62° N. and flows west and then north, with a double north and south loop about 66° 20′ N. It enters the Gulf of Pechora on the Barents sea by a delta after a course of 1,150 m. Its main tributaries are the Izhma, Tsilma and Sula on the left, and the Ilych, Podcherem, Shugor and Usa on the right; the river and its tributaries provide 3,545 m. of navigable waterways, of which 2,335 are fit for rafts and timber floats only and 580 are suitable for steamer navigation. The drainage basin is, however, mainly coniferous forest, and north of lat. 67° N. bleak tundra, the Great Land Tundra on the east, and the Small Land Tundra on the west. The scanty population consists mainly of Nomad Samoyede reindeer breeders and Zirian hunters.

During the brief summer there is steamer connection between Pustozersk and Kuya on the right of the delta, and Archangel. Short portages connect the Pechora waterway with the Kama and the Volga, and with the Vychegda and Northern Dwina, and longer

portages, used mainly by Samoyedes, link it across the Urals with the Ob. In 1925 a cultural base, with 20 hospital beds, boarding facilities for 30 Samoyede pupils and a medical and veterinary staff was established on the Adzva river, a tributary of the Usa. The chief freightage on the Pechora waterways consists of reindeer products, furs and fish going southward and grain and manufactured goods going north. Seals are caught in Pechora gulf, and fishermen migrate there from June to August, the Pechora salmon being specially valuable.

PECK, a dry measure of capacity, especially used for grain. It contains 8 quarts or 2 gallons, and is $\frac{1}{4}$ of a bushel. The imperial peck contains 554·548 cu.in., and in the United States of America 537·6 cub.in. The word is in M.E. *pek,* and is found latinized as *peccum* or *pekka.* In Med. Lat. are found *picotinus,* "mensura frumentaria," and *picotus,* "mensura liquidorum" (Du Cange, *Gloss. s.vv.*).

PECKHAM, JOHN (d. 1292), archbishop of Canterbury, was probably a native of Sussex, and received his early education from the Cluniac monks of Lewes. About 1250 he joined the Franciscan order and studied in their Oxford convent. Shortly afterwards he proceeded to the university of Paris, where he took his degree under St. Bonaventure and became regent in theology. For many years Peckham taught at Paris, coming into contact with the greatest scholars of the day, among others St. Thomas Aquinas. About 1270 he returned to Oxford and taught there, being elected in 1275 provincial minister of the Franciscans in England, but he was soon afterwards called to Rome as *lector sacri palatii,* or theological lecturer in the schools of the papal palace. In 1279 he returned to England as archbishop of Canterbury, being appointed by the pope on the rejection of Robert Burnell, Edward I.'s candidate. Peckham was always a strenuous advocate of the papal power, especially as shown in the council of Lyons in 1274. The characteristic note of his primacy was an insistence on discipline which offended contemporaries.

In philosophy Peckham represents the Franciscan school which attacked the teaching of St. Thomas Aquinas on the "Unity of Form." He wrote much on scientific, scriptural and moral subjects, and defended the Franciscan rule and practice. His hymns are characterized by a lyrical tenderness which seems typically Franciscan. Printed examples of his work as commentator and hymn writer respectively may be found in the *Firamentum trium ordinum* (Paris, 1512), and his office for Trinity Sunday in the "unreformed" breviary.

The chief authority on Peckham as archbishop of Canterbury, is the *Registrum fratris Johannis Peckham,* edited by C. Trice Martin for the Rolls Series (London, 1882–1885). A sympathetic account of his life as a Franciscan is to be found in L. Wadding, *Annales minorum* (Lyons, 1625, 1654). See also the article by C. L. Kingsford in *Dict. Nat. Biog.,* and Wilkin's *Concilia magnae Britanniae* (London, 1737).

PECOCK (or PEACOCK), **REGINALD** (*c.* 1395–*c.* 1460), British prelate and writer, was probably born in Wales, and was educated at Oriel college, Oxford. Having been ordained priest in 1421, he secured a mastership in London in 1431, and soon became prominent by his attacks upon the religious position of the Lollards. In 1444 he became bishop of St. Asaph, and six years later bishop of Chichester. He was an adherent of the house of Lancaster and in 1454 became a member of the privy council. In attacking the Lollards Pecock put forward religious views far in advance of his age. He asserted that the Scriptures were not the only standard of right and wrong; in general he exalted the authority of reason. Owing to these views the archbishop of Canterbury, Thomas Bourchier, ordered his writings to be examined. This was done and he was found guilty of heresy. He was removed from the privy council and he only saved himself from a painful death by privately, and then publicly (at St. Paul's Cross, Dec. 4, 1457), renouncing his opinions.

Pecock, who has been called "the only great English theologian of the 15th century," was then forced to resign his bishopric, and was removed to Thorney abbey in Cambridgeshire, where he doubtless remained until his death. The bishop's chief work is the famous *Repressor of over-much weeting* [blaming] *of the Clergie,* which was issued about 1455. In addition to its great importance in the history of the Lollard movement the *Repressor* has an exceptional interest as a model of the English of the time, Pecock being one of the first writers to use the vernacular. In thought and style it is the work of a man of learning and ability.

A biography of the author is added to the edition of the *Repressor* published by C. Babington for the Rolls Series in 1860. Pecock's other writings include the *Book or Rule of Christian Religion;* the *Donet,* "an introduction to the chief truths of the Christian faith in the form of a dialogue between father and son"; and the *Folewer to the Donet.* The two last works are extant in manuscript. His *Book of Faith* has been edited from the manuscript in the library of Trinity college, Cambridge, by J. L. Morison (Glasgow, 1909). *See* also John Lewis, *Life of Pecock* (1744; new ed., 1820).

PECORA. Horns, hoofs and a diet of grasses or foliage are the three most obvious characteristics of the very important group of mammals known as the Pecora or true ruminants. The name comes from the Latin *pecus,* cattle, but as used by the zoologist it includes not only oxen, sheep and goats, but the diverse types of antelopes, giraffes and deer. Although most of these animals possess either horns or antlers, all have been derived from hornless ancestors, and a few, like the musk-deer of central and eastern Asia, have never developed them. Apart from the horns, which vary very strikingly in shape and construction, not only from family to family but from species to species, the Pecora are a very homogeneous group; perhaps the most eccentric member is the long-necked giraffe, and even this is linked with the more normal types by the okapi, an animal belonging to the giraffe family but with a shorter neck and shorter limbs than the true giraffes. In the wild state ruminants, like all hoofed mammals, seek safety from their carnivorous enemies in flight, only using their antlers or horns as weapons of defence if driven to bay. Swiftest of all are the deer, antelopes and gazelles, while the goats and mountain sheep have a marvellous power of rapidly scaling steep heights to which few carnivores can follow them. It is therefore among the ruminants that we find a more perfect adaptation to a fugitive life than among any other of the larger mammals. Not only do their skeleton and muscular system form together a perfectly constructed running mechanism, but their digestive system is also elaborately planned so that they may hastily snatch a meal in some favourable grazing ground, and store the food temporarily in a special compartment of their stomach until they have found a refuge where they can masticate and digest it at leisure.

Limbs and Feet.—In the skeleton, the proportions of the limbs and the structure of the feet are particularly noteworthy. As in all running animals the lower leg and foot are very long compared with the upper segment of each limb; this ensures a long stride and at the same time a swift one. The surfaces of the joints are grooved and keeled like pulley wheels, permitting free motion forward and backward but limiting the motion in all other directions; joints of this type are very strong, and are admirably adapted for swift locomotion over a smooth surface, though less efficient on very rough ground. The feet are constructed on the "artiodactyl" plan (*see* ARTIODACTYLA): in each foot no more than two of the ancestral five toes are used, the rest being either lost or reduced to vestiges. The animal steps lightly on the very tip of these two remaining toes, the short terminal segments of which are encased by the hoofs. The upper segments (metapodials) of each toe, fused into a single strong bone termed the *cannon bone,* are, in contrast, very long, so that the joints corresponding to our wrist and ankle are raised high above the ground and are consequently often regarded as elbow and knee. Owing to the shortness of the upper segments of the limbs, corresponding to our upper arm and thigh, the true elbow- and knee-joints of the ruminant are close against its body, enclosed within the skin of the trunk.

Dentition.—Quite as distinctive as the foot of a ruminant is its skull, and especially its dentition. Everyone will have noticed how a sheep, when it feeds, seems not so much to bite off the grass as to tear it off by quickly jerking its head. This is because the front teeth in the upper jaw are replaced by a horny pad, while those of the lower jaw are directed forwards, and simply press the grass tightly against this pad on closure of the mouth; when the head is jerked sideways the grass is cut through by the sharp edges of the lower front teeth. It is also a matter of

common observation that in chewing its food a ruminant swings its lower jaw to the side: it usually swings it first a number of times to one side and then, reversing the direction, about an equal number of times to the other side, so that the grinding teeth on both sides of the mouth are used in turn. These grinding or "cheek teeth" are admirably adapted for triturating hard grasses and coarse foliage. Viewed from the side, they appear to be made up of a number of columns, but looked at from the grinding surface they are seen to have a crown pattern of four crescents or V's, sometimes complicated by little additional folds (*see* figure of giraffe's tooth in ARTIODACTYLA). Each crescent is enclosed by a border of enamel which, as it is a very hard substance, prevents the tooth from wearing down too quickly. Also, as the enamel does not wear down at the same rate as the softer substance within, the surface of the crown is always rough and therefore all the more effective as a grinding mechanism. The great height of the crown also ensures that the tooth shall last out the animal's lifetime before it is quite ground away. Similar devices are characteristic of the molar teeth of all herbivorous mammals, since most grasses contain a great deal of silica and this causes very hard wear to the tooth. In those ruminants which feed on soft leaves rather than on grasses, the cheek teeth are much shorter than in the exclusively graminivorous types and have a less complex crown pattern. However high the grinding teeth, the mandible of a ruminant is a slender bone, slung somewhat loosely on to the skull, and the joint between mandible and skull is shaped so as to permit great freedom of movement in grinding.

Digestive Processes.—The following account of the process of rumination is an abbreviation of that given by T. H. Huxley in his *Anatomy of Vertebrated Animals*. A ruminant does not masticate its food on first taking it into its mouth but swallows it hastily, well mixed with saliva. Only when its appetite is satisfied does it stop grazing and seek a place of safety where it can lie down and "chew the cud" at leisure. If we closely observe a cow which has just lain down in a field after a period of grazing, its body inclined to one side, we notice that after an interval of quiescence a sudden spasm, rather resembling a hiccough, passes over the animal's flanks, and that at the same time something is quickly forced up the gullet into the mouth. This is a bolus of grass which, rendered sodden by the fluids in the stomach, is now returned to be masticated by the grinding teeth. This process is repeated until most of the grass which was originally cropped has been reduced to pulp. A ruminant's stomach is divided into four compartments. When the food is first hastily swallowed it passes no further than the first and second of these. On second swallowing it passes along a groove in the roof of the second, directly into the third compartment; chemical digestion takes place in the fourth compartment, which alone has gastric glands in its walls for secretion of digestive juices.

Horns.—There are four main types of horn construction among the Pecora: (1) The antlers of deer. These are usually found in the male deer only, but in the reindeer they are present in both sexes. They grow out from the frontal bones of the skull as solid processes which rapidly reach their full size. At first they are covered by soft and hairy skin. Then a circular ridge called the burr appears at a short distance from the base of the antler and divides the latter into pedicel, on the skull side of the burr, and beam, on the far side. The circulation in the beam now gradually dwindles, and the skin dies and peels off, leaving exposed the dead bone beneath it. Absorption and sloughing take place at the extremity of the pedicel, beam and burr are shed, and the end of the pedicel scabs over. Fresh skin gradually grows up under the scab, so that the pedicel becomes once more smooth and hairy. The antlers are shed and grown anew every year, usually adding additional branches each time. *See* DEER.

(2) In the bovine ruminants the bony core formed by the frontal bone is covered by a horny sheath. The core itself is hollow, instead of solid as in the deer, and therefore the Pecora in this group are sometimes termed the "hollow-horned ruminants" or Cavicornia. The horny sheath is never shed but persists throughout life and grows with the growth of the core. This type of horn is never branched but may be curved, spirally twisted, or compressed; it is often present in both sexes. *See* SHEEP, GOAT, ANTELOPE, etc. (3) In the giraffes (*q.v.*) the horn-cores are covered with soft and hairy skin and are never shed. (4) In the North American pronghorn, *Antilocapra,* there is a permanent, unbranched horn-core enclosed in a horny sheath as in the Bovidae, but this sheath is forked, and furthermore is shed yearly after the rutting season owing to the development of a new sheath which pushes the old one off. *See* PRONGBUCK.

These four types of horn are characteristic of the four families into which existing Pecora are classified: the Cervidae or deer, the Giraffidae or giraffe and okapi, the Bovidae or oxen, sheep, goats, antelopes, etc., and the Antilocapridae, solely represented by the North American pronghorn. Many other forms, now extinct, are known as fossils. The earliest of these were small forms with no antlers but a pair of long slender tusks in the upper jaw like those of the musk deer. From such as these were derived not only the modern families but several families now quite extinct. Especially noteworthy among these latter are the Merycodontidae and the Sivatheriidae. *Merycodus* was a small North American Miocene form with a pair of simple forked antlers very like those of primitive deer but apparently never shed; many characteristics in the skeleton suggest relationship to *Antilocapra. Sivatherium* of the Indian Pliocene, allied to the giraffes, was a gigantic animal with a pair of large palmate antler-like outgrowths on top of the skull and a smaller conical pair above the orbits.

PÉCS, capital of Baranya county, Hungary, on the south-eastern flank of the Mecsek hills. It is believed to date back to Roman times and has been the see of a bishop since 1009. It was occupied by the Turks from 1543 to 1686 and several of its churches were altered and used as mosques. The town is regularly laid out with an inner old town in the form of a square and four suburbs. A beautiful cathedral, reputed one of the oldest churches in Hungary as well as one of its finest mediaeval buildings, is the principal architectural asset. The 14th century university, which lapsed after the battle of Mohács, has been revived. Pop. (1920), 47,556.

PECTORAL, a word applied to various objects worn on the breast (Lat. *pectus*); thus it is the name of the ornamental plate of metal or embroidery formerly worn by bishops of the Roman Church during the celebration of mass, the breastplate of the Jewish high priest, and the metal plate placed on the breast of the embalmed dead in Egyptian tombs. The "pectoral cross," a small cross of precious metal, is worn by bishops and abbots of the Roman, and by bishops of the Anglican, communion.

See "Pectoral" in the Catholic Encyclopaedia.

PECULIAR, a term of ecclesiastical law applied to those ecclesiastical districts, parishes, chapels or churches, once numerous in England, which were outside the jurisdiction of the bishop of the diocese in which they were situated, and were subject to a jurisdiction "peculiar" to themselves. They were introduced originally, in many cases by papal authority, in order to limit the powers of the bishop in his diocese. There were royal peculiars, *e.g.*, the Chapel Royal St. James's, or St. George's Windsor, peculiars of the archbishop, over certain of which the Court of Peculiars exercised jurisdiction (*see* ARCHES, COURT OF), and peculiars of bishops and deans (*see* DEAN). The jurisdiction and privileges of the "peculiars" were abolished by statutory powers given to the Ecclesiastical Commissioners, by the Ecclesiastical Commissioners Acts 1836 and 1850, by the Pluralities Act 1838, the Ecclesiastical Jurisdiction Act 1847, and other statutes.

PECULIAR PEOPLE, a small sect of Christian faith-healers founded in London in 1838 by John Banyard. They consider themselves bound by the literal interpretation of James v. 14, and in cases of sickness seek no medical aid but rely on oil, prayer and nursing. Their avoidance of professional medical attendance has led to severe criticism at inquests on children who have died for want of it.

PEDAGOGUE, a teacher or schoolmaster, a term usually implying pedantry, or narrow-mindedness. The Gr. παιδαγωγός (παῖδ boy, ἀγωγός leader) was not strictly an instructor. He was a slave in an Athenian household who looked after the

personal safety of the sons of the master of the house, and took them to and from school and the gymnasium. The Romans adopted the *paedagogus* or *pedagogus* towards the end of the republic. He probably took some part in the instruction of the boys (*see* SCHOOLS). Under the empire the *pedagogus* was specifically the instructor of the boy slaves, in the household of the emperor, the rich nobles and other persons, these boys lived to-

TYPES OF PEDESTALS FROM ANCIENT TIMES TO THE PRESENT DAY
(A) Statue of Buddha, 700 years old, from Gaya; (B) Chinese lion, Ming Dynasty; (C) Type of Roman Architecture under Septimus Severus, A D. 146–211; (D) Statue of Bartolomeo Colleoni. Venice, begun by Verrocchi, 1481; (E) Modern mahogany pedestal by Auguste Guenot

gether in a *paedagogium*, and were known as *pueri paedagogiani*, a name which has possibly developed into "page "

PEDAL CLARINET, a contrabass instrument invented in 1891 by M F Besson to complete the quartet of clarinets, as the contrafagotto or double bassoon completes that of the oboe family; it is constructed on practically the same principles as the clarinet, and consists of a tube 10ft long It is used in military bands and has a tone rich and full, except for the lowest notes which are unavoidably a little rough in quality

PEDEN, ALEXANDER (*c* 1626–1686), Scottish divine, one of the leading forces in the Covenant movement, was born at Auchinleck, Ayrshire, about 1626, and was educated at Glasgow University He was ordained minister of New Luce in Galloway in 1660, but had to leave his parish under Middleton's Ejectment Act in 1663 His last days were spent in a cave in the parish of Sorn, near his birthplace, and there he died in 1686.

See A Smellie, *Men of the Covenant*, ch. xxiv.

PEDERSEN, CHRISTIERN (*c.* 1480–1554), Danish writer, known as the "father of Danish literature," was a canon of the cathedral of Lund, and took his master's degree in Paris in 1515 In Paris he edited the proverbs of Peder Laale and (1514) the *Historia danica* of Saxo Grammaticus He worked at a continuation of the history of Saxo Grammaticus, and became secretary to Christian II, whom he followed into exile in 1525 In Holland he translated the New Testament (1529) and the Psalms (1531) from the Vulgate, and, becoming a convert to the reformed opinion, he issued several Lutheran tracts After his return to Denmark in 1532 he set up a printing press at Malmo He published a Danish version (*Kronike om Holger Danske*) of the French romance of Ogier the Dane, and another of the Charlemagne legends, which is probably derived immediately from the Norwegian *Karlamagnus saga.* His greatest work, the Danish version of the Holy Scriptures, which is known generally as "Christian III.'s Bible," is an important landmark in Danish literature. It was founded on Luther's version, and was edited by Peter Palladius, bishop of Zealand, and others.

See C. Pedersen's *Danske Skrifter,* ed. C. J. Brandt and B. T. Fenger (5 vols., Copenhagen, 1850–56).

PEDESTAL, a square, polygonal or circular block used as a support. Pedestals were originally employed only to carry statues or votive offerings, but the Romans, in the course of their many experiments in the decorative use of the orders, occasionally placed columns upon pedestals; this is notably the case in connection with such isolated columns as that of Trajan (A D. 114) and in the case of the engaged columns of triumphal arches, where the proportions seemed to demand them Similarly, in superposed orders, as in the Colosseum, at Rome (A D 80), the parapet walls of each storey were projected out under each column as pedestals The Renaissance designers attempted to develop a separate pedestal for each order, with all its dimensions in proportion to those of the column (*see* ORDER). This has no basis in Roman usage

PEDICULOSIS or **PHTHIRIASIS,** the medical term for the pathological symptoms in man due to the presence of lice (*pediculi*), either on the head (*pediculus capitis*), body (*pediculus corporis*, or *vestimentorum*), or pubes (*pediculus pubis*)

PEDIMENT, in architecture, a triangular gable-end, crowned with a raking cornice which follows the slope of its upper edges, or a similar form used decoratively In common usage, the term is restricted to the classic styles, in others, the word gable is used The pediment was given great importance by the Greeks as it was the crowning feature of every temple front In Greek work, the entablature over the columns is carried completely through, horizontally under the pediment; and the tympanum (*q v*), or triangular wall surface, between this horizontal cornice and the raking cornice above was often decorated with sculpture The Romans not only used the pediment in this manner, as the end of a roof, but also adopted it as a purely decorative form to

PEDIMENTS (UPPER) ITALIAN RENAISSANCE "FLORENTINE" PEDIMENT, BY THE DELLA ROBBIAS, (LOWER) GREEK, THE ERECHTHEUM, ATHENS

crown doors, windows and especially niches Where many such decorative pediments occur in a row, the Romans frequently made them alternately triangular and segmental in shape, in this they were copied by the High Renaissance in Italy. Following certain late Roman precedents, in which the line of the raking cornice is broken back in the centre, the designers of the Baroque period developed all sorts of fantastic broken, scrolled and reverse curved pediments; in some cases they even reversed the direction, so that the high part of the broken or sectional pediment was toward the outside of the composition rather than toward the centre, and in

the Churrigueresque, or late Renaissance of Spain, little sections of pediment are used to intricate line patterning.

PEDIPALPI, the name of a group of the class Arachnida (*q.v.*), in some respects connecting the scorpions and the spiders but more nearly related to the latter. The most scorpion-like in appearance are the species of the order Uropygi which takes its name from the termination of the body by a distinct tail formed by the narrowing of the last three segments to form a jointed stalk for a post-anal horny appendage, the homologue of the scorpion's sting, which acts as a tactile organ. In the Urotricha, containing the family Thelyphonidae, this appendage is long, flexible and lash-like; and the legs of the first pair are also tactile, while the palpi, or chelae, are pincer-like and armed with powerful spikes for seizing and impaling prey which consists mostly of beetles and other ground insects. The whip-scorpions, as these Arachnida are sometimes called on account of the lash-like tail, are not poisonous but when handled they emit a pungent, acid secretion which is defensive. They live for the most part in damp places, beneath stones or pieces of wood, in rock-crannies or termites' nests or other crevices where shelter from light and protection from the rays of the sun are obtainable. Some species excavate burrows as dwellings for themselves and their young. The young are hatched from eggs which the female carries about enswathed in a glutinous membrane and attached to the lower side of the abdomen. Most of the species soon die when removed from their humid haunts; but in Florida a species is found which is adapted to dry sandy localities. Whip-scorpions are found in the East Indies where they range from India and Ceylon to southern Japan and the Fiji Islands and in the warmer parts of America from Brazil to the southern states of the Union. There are several genera of which the best known are *Thelyphonus* from India and Java, *Uroproctus* from north-eastern Bengal and *Mistigoproctus* from Brazil, the last two being the largest of the group, measuring about 4 in. in total length.

A degenerate group related to the Urotricha, and known as the Tartarides, contains several genera (*Trithyreus, Schizomus, Hubbardia* belonging to the family Hubbardiidae). The largest measures about ¼ of an inch. Their habits and distribution are similar to those of the whip-scorpions but the group is found in Africa as well as in Asia and America.

The tailless Pedipalpi or Amblypygi recall spiders in appearance, having broader, flatter bodies and longer limbs than the whip-scorpions. Their habits, however, are tolerably similar. They live for the most part under loosened bark or in natural crannies in forests, but do not burrow; and in the East Indies species of the genera *Stygophrynus* and *Catageus* frequent the dark recesses of caves and *Sarax* has been found beneath stones between tide-marks. There are many other genera (*Tarantula, Phrynichus,* etc.), the largest species rivalling the whip-scorpions in size. The group is widely distributed in tropical Asia, Africa and America.

PEDLAR: *see* HAWKERS AND PEDLARS.

PEDRO II. (DOM PEDRO DE ALCANTARA) (1825–1891), second emperor of Brazil, was born in Rio de Janeiro on Dec. 2, 1825. On April 7, 1831, when he was not yet six years old, his father, Pedro I., abdicated in his favour, and for nine years the country was governed by a regency. He was declared of age on July 23, 1840, and was crowned July 18, 1841. He might have perpetuated his dynasty had he been more attentive to political exigencies. On his accession uprisings occurred in several provinces; these were promptly suppressed in São Paulo and Minas Geraes (1842) but held out in Rio Grande do Sul until 1845. The new government persisted in the policy of intervention in Uruguay which had caused the abdication of Pedro I. In 1852 Brazilian troops were chiefly responsible for the defeat of Rosas of Argentina; in 1864 a Brazilian army made Flores *de facto* dictator of Uruguay; and it was owing mainly to Brazilian arms and resources that Solano López, the dictator of Paraguay, was defeated in the Paraguayan War (1864–70). The government had to combat intermittent provincial rebellions (notably that in Pernambuco, 1849), and was faced with diplomatic crises with England, France and the United States. But it left a record unparalleled in South America for conscientious and enlightened rule. The slave trade was prohibited in 1850; in 1871 a law provided for the gradual emancipation of the slaves, and in 1888 an imperial disposition abolished slavery throughout Brazil. The emperor consistently sponsored public improvements, fostered public instruction, and earnestly patronized art and science. He travelled widely, visiting Europe in 1871, 1876 and 1886, and the United States in 1876, affiliating himself closely with foreign intellectual life. In 1889 a crisis arose. The nobility were alienated by the anti-slavery measures and other legislation aimed at reducing their prerogatives; the military was demoralized by long inactivity; the emperor showed too little interest in matters of state. On Nov. 15, Manuel D. da Fonseca (*q.v.*) led a Republican revolt, supported by the army and navy. There was no resistance, the empire ended, and the emperor embarked with his family for Europe on Nov. 17. A Federal republic was proclaimed.

(W. B. P.)

PEEBLES, royal burgh and county town of Peeblesshire, Scotland, at the junction of Eddleston Water with the Tweed. Pop. (1921), 5,537. It is 27 m. S. of Edinburgh by L.N.E.R., and is also the terminus of a branch line of the L.M.S. system from Symington. The burgh consists of the new town on the south of the Eddleston, and the old on the north. Portions of the town walls still exist, and there are cellars constructed in the 16th and 17th centuries as hiding-places against Border freebooters. The old cross stands in High Street. There are several woollen mills, and the town is an agricultural centre.

The name of Peebles is said to be derived from the *pebylls,* or tents, which the Gadeni pitched here in the days of the Romans. The place was a favourite residence of the Scots kings when they came to hunt in Ettrick forest. It probably received its charter from Alexander III., was created a royal burgh in 1367 and was the scene of the poem of *Peblis to the Play,* ascribed to James I. In 1544 the town was damaged in the expedition led by the 1st earl of Hertford, afterwards the protector Somerset, and in 1604 it was partly destroyed by fire. Peebles lost its importance after the union of the Crowns.

On the north bank of the Tweed, stands Neidpath Castle (probably 13th century). It was besieged and taken by Cromwell in 1650.

PEEBLESSHIRE or TWEEDDALE, southern inland county, Scotland, bounded north and north-east by Edinburghshire, east and south-east by Selkirkshire, south by Dumfriesshire, and west by Lanarkshire. Its area is 222,240 ac. (excluding water). The surface consists of a succession of hills, which are highest in the south, and belong to the Silurian uplands of southern Scotland, succeeded by an Ordovician belt. The vale of the Tweed and the glens formed by its numerous tributaries intersect the uplands. South of the Tweed the highest points are Broad Law and Cramalt Craig on the confines of Selkirkshire (each 2,723 ft.), while north of the river the greatest heights reach about 1,800 ft In the north-west a part of the Pentland hills is included, showing upper Silurian and lower Old Red Sandstone rocks. Much glacial boulder clay, in the gravel and sand, rests upon the higher ground, while morainic deposits are found in the valleys. From the fact that for the first 36 m. of its course of 97 m., the river Tweed flows through the south of the shire, the county derives its alternative name of Tweeddale.

The character of the soil varies considerably, peat, gravel and clay being all represented. The low-lying lands consist generally of rich loam, composed of sand and clay. The farming is pastoral rather than arable. About half the holdings are under 100 acres. Under one quarter of the total area is under cultivation.

The L.N.E. railway crosses the county in the north from Leadburn to Dolphinton, and runs down the Eddlestone valley from Leadburn to Peebles and Thornielee, while in the south the L.M.S. railway connects the county town with Biggar in Lanarkshire.

In 1921 the population numbered 15,332. The chief towns are Peebles (pop. 5,539) and Innerleithen (2,403). The shire combines with Midlothian to return two members to parliament, and forms a sheriffdom with the Lothians and Selkirkshire.

The country was early occupied by the Gadeni, a British tribe,

of whom there are many remains in the shape of camps and sepulchral mounds. The standing stones near the confluence of the Lyne and Tweed are supposed to commemorate a Cymric chief. The natives were reduced by the Romans, who have left traces of their military rule in the fine camp at Lyne, locally known as Randal's Walls. On the retreat of the Romans the Gadeni came into their own again, and held the district until the consolidation of the kingdom after Malcolm II.'s victory at Carham in 1018, before which the land, constantly harried by Danes, was nominally included in the territory of Northumbria. This tract of Scotland is closely associated with the legend of Merlin. At Happrew, in the valley of the Lyne, the English defeated Wallace in 1304

PEEKSKILL, a village of Westchester county, New York, U.S.A., on the east bank of the Hudson river, 40 m. above New York city, near the Bear Mountain highway bridge It is served by the New York Central railroad and river steamers Pop (1920) 15,868 (85% native white); 1925 State census, 17,993. There is a U.S. naval magazine on Iona island, off Peekskill, and just above the village, on the river, is the State military camp About 1760 the village took its present name from that of the adjacent creek or "kill," on which Jans Peek, a Dutch trader, had established a trading post. It was incorporated in 1816 During the latter part of the Revolution it was an important outpost of the Continental army.

PEEL, ARTHUR WELLESLEY PEEL, 1st Viscount (1829–1912), English statesman, youngest son of the great Sir Robert Peel, was born on Aug 3, 1829, and was educated at Eton and Balliol college, Oxford He entered parliament in 1865, was parliamentary secretary to the poor law board (1868–71), secretary to the board of trade (1871–73); patronage secretary to the treasury (1873–74); and in 1880 he became under-secretary for the home department On the retirement of Mr Brand (afterwards Viscount Hampden) in 1884, Peel was elected Speaker. He was thrice re-elected to the post, twice in 1886, and again in 1892 He will always rank as one of the greatest holders of this important office On his retirement in 1895 he received a viscounty He was keenly interested in licensing reform, and drafted a report for the royal commission of 1896–99 advocating a large reduction in the number of licensed houses, and that no compensation should be paid from the public rates or taxes the money for this purpose being raised by an annual licence-rental levied on the rateable value of the licensed premises; it at once became a valuable weapon in the hands of advanced reformers Lord Peel died at Sandy, Bedfordshire, on Oct 24, 1912

He was succeeded by his son, William Robert Wellesley Peel, 2nd viscount (b 1867), who was educated at Harrow and at Balliol college, Oxford, and was called to the bar at the Inner Temple in 1893 From 1908 to 1910 he was leader of the Municipal Reform party In 1916 he was chairman of the Committee on the Detention of Neutral Vessels He was appointed under-secretary for war in 1919, chancellor of the duchy of Lancaster (1921), minister of transport (1921–22), and was secretary of State for India from 1922 to 1924 He was made first commissioner of works in Baldwin's second Government in 1924

PEEL, SIR ROBERT, Bart. (1788–1850), English statesman, was born on Feb. 5, 1788, at Chamber Hall, near Bury Lancashire, or, less probably, at a cottage near the Hall His grandfather, Robert Peel, first of Peelfold, and afterwards of Brookside, near Blackburn, was a calico-printer, who took to cotton-spinning with the spinning-jenny and grew a wealthy man His father, Robert Peel (1750–1830), third son of the last-named, carried on the same business at Bury; he was M.P. for Tamworth was a supporter of Pitt, contributed munificently towards Pitt's war policy, and was rewarded with a baronetcy (1800)

Robert Peel was educated at Harrow School and at Christ Church, Oxford, where he took a first class both in classics and mathematics. On leaving Oxford he was entered at Lincoln's Inn, and in 1809, at the age of 21, entered the House of Commons He sat at first for the close borough of Cashel, then for Chippenham

He made his mark in the House by the closest attention to all his parliamentary duties, by a study of all the business of parliament, and by a style of speaking which owed its force to knowledge of the subject in hand, clearness of exposition, close reasoning, and tact in dealing with a parliamentary audience Young Peel's lot, however, was cast, through his father, with the Tory party. In his maiden speech in 1810, seconding the address, he defended the Walcheren expedition, which he again vindicated soon afterwards against the report of Lord Porchester's committee. He began official life in 1810 as Lord Liverpool's under-secretary for war and the colonies under the Perceval administration In 1812 he was transferred by Lord Liverpool (now premier) to the more important but unhappy post of secretary for Ireland. There he was engaged till 1818 in maintaining English ascendancy over a country heaving with discontent, teeming with conspiracy, and on the verge of rebellion Peel plied the established engines of coercion and patronage with a vigorous hand At the same time, he had to combat Grattan, Plunkett, Canning and the other movers and advocates of Roman Catholic emancipation in the House of Commons He promoted joint education in Ireland as a means of reconciling sects But his greatest service to Ireland as secretary was the institution of the regular Irish constabulary, nicknamed after him "Peelers," for the protection of life and property in a country where both were insecure His moderation of tone did not save him from the violent abuse of O'Connell, whom he was ill advised enough to challenge—an affair which covered them both with ridicule. In 1817 he was elected member for the university of Oxford—an honour for which he was chosen in preference to Canning on account of his unwavering hostility to Roman Catholic emancipation, Lord Eldon lending him his best support In the following year he resigned the Irish secretaryship, of which he had long been weary, and remained out of office till 1821 But he still supported the ministers, though in the affair of Queen Caroline he stood aloof, disapproving some steps taken by the government, and sensitive to popular opinion; and when Canning retired on account of this affair Peel declined Lord Liverpool's invitation to take the vacant place in the cabinet During this break in his tenure of office he had some time for reflection, which there was enough in the aspect of the political world to move But early office had done its work It had given him excellent habits of business, great knowledge and a high position; but it had left him somewhat stiff and punctilious, though he was no pedant in business; in corresponding on political subjects he loved to throw off official forms and communicate his views with the freedom of private correspondence Where his confidence was given, it was given without reserve

At this period he was made chairman of the bullion committee on the death of Horner He was chosen for this important office by Huskisson Ricardo and their fellow-economists, who saw in him a mind open to conviction, though he owed hereditary allegiance to Pitt's financial policy and had actually voted with his Pittite father for a resolution of Lord Liverpool's government asserting that Bank of England notes were equivalent to legal coin The choice proved judicious Peel was converted to the currency doctrines of the economists, and proclaimed his conversion in a great speech on May 24 1819, in which he moved and carried four resolutions embodying the recommendations of the bullion committee in favour of a return to cash payments This laid the foundation of his financial reputation, and his co-operation with the economists tended to give a liberal turn to his commercial principles In the course he took he somewhat diverged from his party, and particularly from his father, who remained faithful to Pitt's depreciated paper, and between whom and his schismatic son a solemn and touching passage occurred in the debate The author of the Cash Payments Act had often to defend his policy, and he did so with vigour The act was hard on debtors, including the nation as debtor, because it required debts to be paid in cash which had been contracted in depreciated paper; and Peel, as heir to a great fundholder, was even charged with being biased by his personal interests But the Bank Restriction Acts, under which the depreciated paper had circulated, themselves contained a provision for a return to cash payments six months after peace.

In 1820 Peel married Julia, daughter of General Sir John Floyd, who bore him five sons and two daughters His domestic life was

singularly happy, and he had many fast friends among the ablest men of his time. Cold as he was in public, few men could be more genial in private than Peel.

In 1821 Peel rejoined Liverpool's ministry as home secretary; and in that capacity he had again to undertake the office of coercing the growing discontent in Ireland, of which he remained the real administrator, and had again to lead in the House of Commons the opposition to the rising cause of Roman Catholic emancipation. In 1825, being defeated on the Roman Catholic question in the House of Commons, he wished to resign office, but Lord Liverpool pleaded that his resignation would break up the government. He found a congenial task in reforming and humanizing the criminal law, especially those parts of it which related to offences against property and offences punishable by death. The five acts in which Peel accomplished this great work, as well as the great speech of March 9, 1826, in which he opened the subject to the house, form one of the most solid and enduring monuments of his fame. Criminal law reform was the reform of Romilly and Mackintosh, from the hands of the latter of whom Peel received it. But the bills in which it was embodied were the bills of Peel.

In 1827 the Liverpool ministry was broken up by the fatal illness of its chief, and under the new premier, George Canning, Peel, like the duke of Wellington and other high Tory members of Lord Liverpool's cabinet, refused to serve. Canning and Peel were rivals; but we need not interpret as mere personal rivalry that which was certainly, in part at least, a real difference of connection and opinion. Canning took a Liberal line, and was supported by many of the Whigs; the seceders were Tories, and it is difficult to see how their position in Canning's cabinet could have been otherwise than a false one. Separation led to public coolness and occasional approaches to bitterness on both sides in debate. Their private intercourse remained uninterrupted to the end; and Canning's son afterwards entered public life under the auspices of Peel. The charge of having urged Roman Catholic emancipation on Lord Liverpool in 1825, and opposed Canning for being a friend to it in 1827, made against Sir Robert Peel in the fierce Corn Law debates of 1846, was withdrawn by those who made it.

In January 1828, after Canning's death, the duke of Wellington formed a Tory government, in which Peel was home secretary and leader of the House of Commons. This cabinet, Tory as it was, did not include the impracticable Lord Eldon, and did include Huskisson and three more friends of Canning. Its policy was to endeavour to stave off the growing demand for organic change by administrative reform, and by lightening the burdens of the people. The civil list was retrenched with an unsparing hand, the public expenditure was reduced lower than it had been since the Revolutionary war, and the import of corn was permitted under a sliding scale of duties. Peel also introduced into London the improved system of police which he had previously established with so much success in Ireland. But the tide ran too strong to be thus headed. First the government were compelled, after a defeat in the House of Commons, to acquiesce in the repeal of the Test and Corporation Acts, Peel bringing over their High Church supporters, as far as he could. Immediately afterwards the question of Roman Catholic emancipation was brought to a crisis by the election of O'Connell for the county of Clare. In August Peel expressed to the duke of Wellington his conviction that the question must be settled. He wrote that out of office he would co-operate in the settlement but in his judgment it should be committed to other hands than his. To this the duke assented, but in January 1829, owing to the declared opinions of the king, of the House of Lords, and of the Church against a change of policy, Wellington came to the conclusion that without Peel's aid in office there was no prospect of success. Under that pressure Peel consented to remain, and all the cabinet approved. The consent of the king, which could scarcely have been obtained except by the duke and Peel, was extorted, withdrawn (the ministers being out for a few hours), and again extorted; and on March 5, 1829, Peel proposed Roman Catholic emancipation in a speech of more than four hours. The apostate was overwhelmed with obloquy. Having been elected for the university of Oxford as a leading opponent of the Roman Catholics, he had thought it right to resign his seat on being converted to emancipation. His friends put him again in nomination, but he was defeated by Sir R. H. Inglis. He took refuge in the close borough of Westbury, whence he afterwards removed to Tamworth, for which he sat till his death. Catholic emancipation was forced on Peel by circumstances; but it was mainly owing to him that the measure was complete, and based upon equality of civil rights. This great concession, however, did not save the Tory government. It fell on November 1830, but not before Peel had accomplished further important reforms in the administration of justice.

While in office, Peel succeeded to the baronetcy, Drayton Manor and a great estate by the death of his father (May 3, 1830). The old man had lived to see his fondest hopes fulfilled in the greatness of his son; but he had also lived to see that a father must not expect to fix his son's opinions.

Peel's resistance to the Reform Bill won back for him the allegiance of his party. His opposition was resolute but temperate, and once only he betrayed the suppressed fire of his temper, in the debate of April 22, 1831, when his speech was broken off by the arrival of the king to dissolve the parliament which had thrown out reform. He refused to join the duke of Wellington in the desperate enterprise of forming a Tory government at the height of the storm, when the Grey ministry had gone out on the refusal of the king to promise them an unlimited creation of peers. By this conduct he secured for his party the full benefit of the reaction which he no doubt knew was sure to ensue. The general election of 1832, after the passing of the Reform Bill, left him with barely 150 followers in the House of Commons; but this handful rapidly swelled under his management into the great Conservative party. He frankly accepted the Reform Act as irrevocable, taught his party to register instead of despairing, appealed to the intelligence of the middle classes, whose new-born power he appreciated, steadily supported the Whig ministers against the Radicals and O'Connell, and gained every advantage which parliamentary tactics could afford. To this policy, and to the great parliamentary powers of its author, it was mainly due that, in the course of a few years, the Conservatives were as strong in the reformed parliament as the Tories had been in the unreformed. It is vain to deny the praise of genius to such a leader, though the skill of a pilot who steered for many years over such waters may sometimes have resembled craft. But the duke of Wellington's emphatic eulogy on him was, "Of all the men I ever knew, he had the greatest regard for truth." The duke might have added that his own question, "How is the king's government to be carried on in a reformed parliament?" was mainly solved by the temperate and constitutional policy of Peel, and by his personal influence on the debates and proceedings of the House of Commons during the years which followed the Reform Act.

In 1834, on the dismissal of the Melbourne ministry, power came to Sir Robert Peel before he expected or desired it. He hurried from Rome at the call of the duke of Wellington, whose sagacious modesty yielded him the first place, and became prime minister, holding the two offices of first lord of the treasury and chancellor of the exchequer. He vainly sought to include in his cabinet two recent seceders from the Whigs, Lord Stanley and Sir James Graham. A dissolution gave him a great increase of strength in the house, but not enough. He was outvoted on the election of the speaker at the opening of the session of 1835, and, after struggling on for six weeks longer, resigned on the question of appropriating part of the revenues of the Church in Ireland to national education. His time had not yet come; but the capacity, energy and resource he displayed in this short tenure of office raised him immensely in the estimation of the house, his party and the country. Of the great budget of practical reforms which he brought forward, the plan for the commutation of tithes, the ecclesiastical commission, and the plan for settling the question of dissenters' marriages bore fruit.

From 1835 to 1840 he pursued the same course of patient and far-sighted opposition. In 1839, the Whigs having resigned on the Jamaica Bill, he was called on to form a government, and submitted names for a cabinet, but resigned the commission owing to the young queen's persistent refusal to part with any Whig ladies

of her bedchamber. (*See* VICTORIA, QUEEN.) The elections of 1841 placed the Whigs in a minority of 91; they resigned, and Sir Robert Peel became first lord of the treasury, with a commanding majority in both Houses of Parliament.

The crisis called for a master-hand. The finances were in disorder. For some years there had been a growing deficit, estimated for 1842 at more than two millions, and attempts to supply this by additions to assessed taxes and customs duties had failed. The great financier took till the spring of 1842 to mature his plans. He then boldly supplied the deficit by imposing an income-tax on all incomes above £150 a year. He accompanied this tax with a reform of the tariff, by which prohibitory duties were removed and other duties abated on a vast number of articles of import, especially the raw materials of manufactures and prime articles of food. Increased consumption, as the reformer expected, countervailed the reduction of duty. The income-tax was renewed and the reform of the tariff carried still farther on the same principle in 1845. The result was, in place of a deficit of upwards of two millions, a surplus of five millions in 1845, and the removal of seven millions and a half of taxes up to 1847, not only without loss, but with gain to the ordinary revenue of the country. The prosperous state of the finances and of public affairs also permitted a reduction of the interest on a portion of the national debt, giving a yearly saving at once of £625,000, and ultimately of a million and a quarter to the public. In 1844 another great financial measure, the Bank Charter Act, was passed and, though severely controverted and thrice suspended at a desperate crisis, has ever since regulated the currency of the country. In Ireland O'Connell's agitation for the repeal of the Union had now assumed threatening proportions, and verged upon rebellion. The great agitator was prosecuted, with his chief adherents, for conspiracy and sedition; and, though the conviction was quashed for informality, repeal was quelled in its chief. At the same time the Charitable Bequest Act, which gave Irish Catholics power to endow their own religion, an increased allowance to Maynooth, and three new "Queen's Colleges" open to Catholics and Protestants alike, improved the Irish situation.

The last remnants of the penal laws against Catholics in Great Britain and Ireland were swept from the statute-book, and justice was extended to the Roman Catholic Church in Canada and Malta. In the same spirit acts were passed for clearing from doubt Irish Presbyterian marriages, for settling the titles of a large number of dissenters' chapels in England, and removing the municipal disabilities of the Jews. The grant for national education was trebled, and an attempt was made, though in vain, to introduce effective education clauses into the factory bills. To the alienation of any part of the revenues of the Church of England, Peel never would consent; but he had issued the ecclesiastical commission, and he now made better provision for a number of populous parishes by a redistribution of part of the revenues of the Church. The weakest part of the conduct of Peel's government, perhaps, was its failure to control the railway mania by promptly laying down the lines on a government plan. It passed an act in 1844 which gave the government a right of purchase, and it had prepared a palliative measure in 1846, but was compelled to sacrifice this, like all other secondary measures, to the repeal of the Corn Laws. It failed also to avert the great schism in the Church of Scotland. Abroad it was as prosperous as at home. It had found disaster and disgrace in Afghanistan. It speedily ended the war there, and in India the invading Sikhs were destroyed upon the Sutlej. The sore and dangerous questions with France, touching the right of search, the war in Morocco, and the Tahiti affair, and with the United States touching the Maine boundary and the Oregon territory, were settled by negotiation.

Yet there were malcontents in Peel's party. The Young Englanders disliked him because he had hoisted the flag of Conservatism instead of Toryism on the morrow of the Reform Bill. The strong philanthropists and Tory Chartists disliked him because he was a strict economist and an upholder of the new poor law. But the fatal question was protection. That question was being fast brought to a crisis by public opinion and the Anti-Corn-Law League. Peel had been recognized in 1841 by Cobden as a Free Trader, and after experience in office he had become in principle more and more so. Since his accession to power he had lowered the duties of the sliding scale. He had alarmed the farmers by admitting foreign cattle and meat under his new tariff, and by admitting Canadian corn. He had done his best in his speeches to put the maintenance of the Corn Laws on low ground, and to wean the landed interest from their reliance on protection. The approach of the Irish famine in 1845 turned decisively the wavering balance. When at first Peel proposed to his cabinet the revision of the Corn Laws, Lord Stanley and the duke of Buccleuch dissented, and Peel resigned. But Lord John Russell failed to form a new government. Peel returned to office; and now, with the consent of all the cabinet but Lord Stanley, who retired, he, in a great speech on Jan. 27, 1846, brought the repeal of the Corn Laws before the House of Commons. In the long and fierce debate that ensued he was assailed, both by political and personal enemies, with the most virulent invective, which he ignored. His measure was carried; but immediately afterwards the protectionists, led by Lord George Bentinck and Benjamin Disraeli, coalesced with the Whigs, and threw him out on the Irish Coercion Bill. He immediately resigned.

Though out of office he was not out of power. He had "lost a party, but won a nation." The Whig ministry which succeeded him leant much on his support He joined them in carrying forward free-trade principles by the repeal of the navigation laws. He supported their bill for the emancipation of the Jews. One important measure was his own. While in office he had probed, by the Devon commission of inquiry, the sores of Ireland connected with the ownership and occupation of land. In 1849, in a speech on the Irish Poor Laws, he first suggested, and in the next year he aided in establishing, a commission to facilitate the sale of estates in a hopeless state of encumbrance. The Encumbered Estates Act transferred the land from ruined landlords to solvent owners capable of performing the duties of property towards the people. On June 28, 1850, Peel made a great speech on the Greek question against Palmerston's foreign policy of interference. This speech was thought to show that if necessary he would return to office. It was his last. On the following day he was thrown from his horse on Constitution Hill, and mortally injured by the fall. On July 2, 1850, he died. All the tributes which respect and gratitude could pay were paid to him by the sovereign, by parliament, by public men of all parties, by the country, by the press, and, above all, by the great towns and the masses of the people to whom he had given "bread unleavened with injustice."

Peel was bred a Tory in days when party was a religion; he entered parliament a youth, was in office at twenty-four and secretary for Ireland at twenty-five; his public life extended over a long period rife with change; and his own changes were all forward and with the advancing intellect of the time. He was undoubtedly one of the hardest workers and greatest administrators England has ever had, and the young men trained in his school, Gladstone, Graham, Sidney Herbert, Cardwell, with others who bore the name of Peelites, inherited a great tradition of hard work and disinterestedness in the public service. Peel had a great share in giving practical effect to the great legal and administrative reforms of his day. Of the three great issues with which Peel was confronted, parliamentary reform, Catholic emancipation, and protection, the controversies on the first two are dead; the third is still a matter on which there is a violent conflict of opinon. Nevertheless it was by the repeal of the Corn Laws that he won the masses of the people. If the question is, not whether he was a far-sighted statesman but whether he was a ruler loved and trusted by the English people, there is no arguing against the tears of a nation.

PEEL, seaport, township, watering-place, on the west coast of the Isle of Man, 12 m. W. of Douglas on the Isle of Man railway. Pop. (1921) 2,690. It lies on Peel bay, at the mouth of the river Neb, which forms the harbour. The old town consists of narrow streets and lanes, but a modern residential quarter has grown up to the east. On the west side of the river-mouth St. Patrick's Isle, connected with the mainland by a causeway, is occupied almost wholly by the ruins of Peel castle. St. Patrick is said to have founded here the first church in Man, and a small chapel, dedicated to him, appears to date from the 8th or 10th century. There is a round tower, also of very early date. The ruined cathedral of St. German has a transitional Norman choir, with a very early crypt beneath, and a nave with an early English triplet at the west end. There are remains of the bishops' palace, of the palace of the Lords of Man, of the keep and guardroom above the entrance to the castle, and of the Moare or great tower, while the whole is surrounded by battlements. In 1397 Richard II. condemned the earl of Warwick to imprisonment in Peel castle and in 1444 Eleanor, duchess of Gloucester, received a like sentence. Peel has a long-established fishing industry. It was called by the Northmen *Holen* (island, *i.e.,* St. Patrick's Isle), the existing name is Celtic, meaning "fort."

PEELE, GEORGE (1558?–1597?), English dramatist, was born in London. His father, who appears to have belonged to a Devonshire family, was clerk of Christ's Hospital, and wrote two treatises on book-keeping. George Peele was educated at Christ's Hospital, and entered Broadgates Hall (Pembroke College), Oxford, in 1571. In 1574 he removed to Christ Church, taking his B.A. degree in 1577, and proceeding M.A. in 1579. In 1579 the governors of Christ's Hospital requested their clerk to "discharge his house of his son, George Peele." He went up to London about 1580, but in 1583 when Albertus Alasco (Albert Laski), a Polish nobleman, was entertained at Christ Church, Oxford, Peele was entrusted with the arrangement of two Latin plays by William Gager (*fl.* 1580–1619) presented on the occasion. He was also complimented by Dr. Gager for an English verse translation of one of the *Iphigenias* of Euripides. In 1585 he was employed to write the *Device of the Pageant borne before Woolston Dixie,* and in 1591 he devised the pageant in honour of another lord mayor, Sir William Webbe. This was the *Descensus Astraeae* (printed in the *Harleian Miscellany,* 1808), in which Queen Elizabeth is honoured as Astraea. Peele had married as early as 1583 a lady who brought him some property, which he speedily dissipated. The sorry traditions of his reckless life were emphasized by the use of his name in connection with the apocryphal *Merrie conceited Jests of George Peele* (printed in 1607). Many of the stories had done service before, but there are personal touches that may be biographical. He died before 1598, for Francis Meres, writing in that year, speaks of his death in his *Palladis Tamia.*

His pastoral comedy of *The Araygnement of Paris,* presented by the Children of the Chapel Royal before Queen Elizabeth perhaps as early as 1581, was printed anonymously in 1584. Charles Lamb, sending to Vincent Novello a song from this piece of Peele's, said that if it had been less uneven in execution Fletcher's *Faithful Shepherdess* "had been but a second name in this sort of writing." Peele's other reputed works are *The Famous Chronicle of King Edward the first* (printed 1593); *The Battell of Alcazar—with the death of Captaine Stukeley* (acted 1588–1589, printed [anon.] 1594); *The Old Wives Tale* (printed 1595), a play within a play, with a background of rustic folk-lore; and *The Love of King David and fair Bethsabe* (written *c.* 1588, printed 1599); *Sir Clyomon and Sir Clamydes* (printed 1599) has been attributed to Peele, but on insufficient grounds. Among his occasional poems are "The Honour of the Garter" and "Polyhymnia" (1590). To the *Phoenix Nest* in 1593 he contributed "The Praise of Chastity." Mr. F. G. Fleay (Biog. Chron. of the Drama) credits Peele with *The Wisdom of Doctor Doddipoll* (printed 1600), *Wily Beguiled* (printed 1606), *The Life and Death of Jack Straw, a notable rebel* (1587?), a share in the First and Second Parts of *Henry VI.,* and on the authority of Wood and Winstanley, *Alphonsus, Emperor of Germany.*

Peele belonged to the group of university scholars who, in Greene's phrase, "spent their wits in making playes." Greene went on to say that he was "in some things rarer, in nothing inferior," to Marlowe. This praise was not unfounded. The credit given to Greene and Marlowe for the increased dignity of English dramatic diction, and for the new smoothness infused into blank verse, must certainly be shared by Peele.

Peele's *Works* were edited by Alexander Dyce (1828, 1829–39 and 1861); by A. H. Bullen (2 vols., 1888). An examination of the metrical peculiarities of his work is to be found in F. A. R. Lämmerhirt's *Georg Peele, Untersuchungen über sein Leben und seine Werke* (Rostock, 1882) *See* also Professor F. B. Gummere, in *Representative English Comedies* (1903); an edition of *The Battell of Alcazar,* printed for the Malone Society in 1907; P. Cheffand, *Étude sur George Peele* (1913); W. W. Greg, an ed. of the *Battell of Alcazar* (1922).

PEEP-OF-DAY BOYS, an Irish Protestant secret society, formed about 1785. Its object was to protect the Protestant peasantry, and avenge their wrongs on the Roman Catholics. The "Boys" gained their name from the hour of dawn which they chose for their raids on the Roman Catholic villages. The Roman Catholics in return formed the society of "The Defenders."

PEEPUL or **PIPUL** (*Ficus religiosa*), the "sacred fig" tree of India, is also called the Bo tree. It is not unlike the banyan, and is venerated both by the Buddhists of Ceylon and the Vaishnavite Hindus, who say that Vishnu was born beneath its shade. It is planted near temples and houses; its sap abounds in caoutchouc, and a good deal of lac is obtained from insects who feed upon the branches. The fruit is about the size of a walnut and is not much eaten. (*See* FIG.)

PEERAGE. Although in England the terms "peerage" (Fr. *pairage;* Med. Lat. *paragium;* M.E. *pere;* O.Fr. *per, peer,* later *pair;* Lat. *paris,* "equal"), "nobility," "House of Lords" are commonly regarded as synonymous, in reality each expresses a different meaning. A man may be a peer and yet not be a member of the House of Lords, a member of the House of Lords and yet not strictly a peer; though all peers are members of the House of Lords, either *in esse* or *in posse.* In the United Kingdom the rights, duties and privileges of peerage are centred in an individual, while to the old monarchical notions of the Continent, nobility conveyed the idea of family, as opposed to personal, privilege.

The Origin of Peerage.—Etymologically, "peers" are "equals" (*pares*), and in Anglo-Norman days the word was invariably so understood. The feudal tenants-in-chief of the Crown were all the peers of one another; so, too, a bishop had his ecclesiastical peer in a brother bishop, and the tenants of a manor their peers in their fellow-tenants. That even so late as the reign of John the word was still used in this general sense is clear from Magna Carta, for the term "judicium parium" therein must be understood to mean that every man had a right to be tried by his equals. This right was asserted by the barons as a body in 1233 on behalf of Richard, earl marshal, who had been declared a traitor by the king's command, and whose lands were forfeited without proper trial. In 1233 the French bishop, Peter des Roches, Henry III.'s minister, denied the barons' right to the claim set up, on the ground that the king might judge all his subjects alike, there being, he said, no peers in England (Math. Paris. 389). The English barons undoubtedly were using the word in the sense it held in Magna Carta, while the bishop probably had in his mind the French peers (*pairs de France*), a small and

select body of feudatories possessed of exceptional privileges. The change in England was gradual, and probably gathered force as the gulf between the greater barons and the lesser widened, until in course of time, for judicial purposes, there came to be only two classes, the greater barons and the rest of the people. Ecclesiastics had special privileges for most purposes, being triable only by the Church. The first use of the word "peers," as denoting those members of the baronage who were accustomed to receive regularly a personal writ of summons to parliament, is found in the record of the proceedings against the Despensers in 1321. (Stubbs, *Const. Hist.* ii. 347.)

Anglo-Norman Baronage.—Properly to understand the growth and attributes of the peerage it is necessary to trace the changes which occurred in the position of the Anglo-Norman baronage, first through the gradual strengthening of royal supremacy, with the consequent decay of baronial power locally, and subsequently by the consolidation of parliamentary institutions during the reigns of the first three Edwards. In place of the individual absolute ownership of Saxon days, the Conqueror became practically the sole owner of the soil. The change, though not immediately complete, followed rapidly as the country settled down and the power of the Crown extended to its outlying frontiers. The new owners became direct tenants of the king. All tenants-in-chief were termed generally barons (*see* BARON).

The King's Court.—The king's tenants owed as a duty the service of attending the King's Court (*curia regis*), and out of this custom grew the parliaments of later days. In theory all the king's tenants-in-chief, great and small, had a right to be present as incident to their tenure. The King's Court was held regularly at the three great festivals of the Church and at such other times as deemed advisable. The assembly for several generations neither possessed nor pretended to any legislative powers. Legislative power was a product of later years, and grew out of the custom of the Estates granting supplies only on condition that their grievances were first redressed. The great bulk of the tenants were present for the purpose of assenting to special taxation above and beyond their ordinary feudal dues. When necessary a general summons to attend was sent through the sheriff of every county, who controlled a system of local government which enabled him to reach every tenant. In course of time to a certain number of barons and high ecclesiastics it became customary to issue a personal writ of summons, thus distinguishing them from the general mass summoned through the sheriff.

Magna Carta and Personal Summons to the Majores Barones.—The sequel is found in Magna Carta, wherein it is provided that the archbishops, bishops, abbots, earls and greater barons are to be called up to the council by writ directed to each severally; and all who hold of the king in chief, below the rank of greater barons, are to be summoned by a general writ addressed to the sheriff of their shire. Magna Carta thus indicates two definite sections of the king's tenants, a division which had evidently persisted for some time. The "greater barons" are the parents of the peers of later days. From 1254 to 1295 in varying numbers there were summoned to the King's Councils representatives of the counties, boroughs and cities. The assembly of 1295, called the Model Parliament, is regarded legally as the first of our freely-elected properly representative assemblies.

To every spiritual and temporal baron accustomed to receive an individual writ, one was issued. Every county elected its knights, and every city or borough of any importance was instructed by the sheriff to elect and to return its allotted number of representatives. It may be taken for granted, however, that any assembly held since 1295, which did not conform substantially to the model of that year, cannot be regarded constitutionally as a full parliament. The point is even of modern importance, as in order to establish the existence of a barony by writ it must be proved that the claimant's ancestor was summoned by individual writ to a full parliament, and that either he himself or one of the heirs of his body was present in a full parliament.

Grades of Peerage.—An examination of the early writs issued to individuals shows that the baronage consisted of archbishops, bishops, abbots, priors, earls and barons. While the archbishops and bishops received their writs with regularity, the summonses to heads of ecclesiastical houses and greater barons were intermittent. The prelate held an office which lived on regardless of the fate of its temporary holder, and if by reason of death, deprivation or translation the office became vacant, a writ still issued to the "Guardian of the Spiritualities." The prior or the abbot, on the other hand, often outside the jurisdiction of the English Church, and sometimes even owing allegiance to a foreign order, was but the personal representative of a land-holding community. The conclusion, then, may be drawn that in theory the issue of a writ was at the pleasure of the Crown, and that in practice the moving factor in the case of the prelates was office and personal importance, and in the case of priors, abbots, earls and barons, probably, in the main, extent of possession.

Hereditary Principle.—The next point for consideration is when did the peerage, as the baronage subsequently came to be called, develop into a body definitely hereditary? Here again growth was gradual and somewhat obscure. Throughout the reigns of the first three Edwards summonses were not always issued to the same individual for successive parliaments; and it is quite certain the king never considered that the issue of one writ to an individual bound the Crown to its repetition for the rest of his life, much less to his heirs in perpetuity. Again we must look to tenure for an explanation. The custom of primogeniture tended to secure estates in strict family succession, and if extent of possession had originally extracted the acknowledgment of a personal summons from the Crown it is more than probable that as successive heirs came into their inheritance they, too, would similarly be acknowledged. In early days the summons was a burden to be suffered of necessity, an unpleasant incident of tenure, in itself undesirable, and probably so regarded by the majority of recipients during at least the two centuries following the Conquest. Gradually the free and indiscriminate choice of the Crown became fettered by the principle that, once a summons had been issued to an individual to sit in parliament and he had obeyed that summons, he thereby acquired a right of summons for the rest of his lifetime; and in later years, when the doctrine of nobility of blood became established, his heirs were held to have acquired the same privilege by hereditary right.

The earl's position in the baronage needs some explanation. Modern historical opinion inclines to the view that while originally an earldom may have been something of an office, it rapidly became little more than an added name of dignity conferred on one already a leading member of the baronage. Earls received individual summonses to parliament by the name of Earl (*q.v.*); but there is reason to believe that in early days at any rate they sat by tenure as members of the baronage.

If we review the political situation at the beginning of the 14th century a great change is evident. The line between those members of the baronage in parliament and the rest of the people is firmly and clearly drawn. Tenure as the sole qualification for presence in the national assembly has disappeared, and in its place there appears for the baronage a system of royal selection and for the rest of the people one of representation.

Peerage a Personal Dignity.—Primogeniture, a custom somewhat uncertain in early Anglo-Norman days, had rapidly developed into a definite rule of law. As feudal dignities were, in their origin, inseparable from the tenure of land, it is not surprising that they, too, followed a similar course of descent, although as the idea of a dignity being exclusively personal gradually emerged, some necessary deviations from the rules of law relating to the descent of land inevitably resulted. In the 11th year of his reign Richard II. created by letters patent John Beauchamp "Lord de Beauchamp and baron of Kyddermynster, to hold to him and the heirs of his body." These letters patent were not founded on any right by tenure of land possessed by Beauchamp, for the king makes him "for his good services and in respect of the place which he has holden at the coronation (*i.e.*, steward of the household) and might in future hold in the king's councils and parliaments, and for his noble descent, and his abilities and discretion, one of the peers and barons of the kingdom of England; willing that the said John and the heirs-male of

his body issuing, should have the state of baron and should be called by the name of "Lord de Beauchamp and baron of Kyddermynster." The grant rested wholly on the grace and favour of the Crown, and was a personal reward for services rendered. Here, then, is an hereditary barony entirely a personal dignity and quite unconnected with land. From Richard's reign to the present day, baronies (and, indeed, all other peerage honours) have continued to be conferred by patent. The custom of summons by writ was not in any way interfered with, the patent operating merely to declare the dignity and to define its devolution. Summons alone still continued side by side for many generations with summons founded on patent; but after the reign of Henry VIII. the former method fell into disuse, and during the last 250 years there have been no new creations by writ of summons alone. So, from the reign of Richard II., barons were of two classes, the older, and more ancient in lineage summoned by writ alone, the honours descending to heirs-general, and the newer created by letters patent, the terms of which governed the issue of the summons and prescribed the devolution of the peerage in a line usually of the direct male descendants of the person first ennobled.

Peerages by Tenure.—It was long believed that, originally, there existed peerages by tenure alone and that such could devolve by right of tenure independent of descent. The Berkeley case of 1858–61 (better reported 8 H.C.L. 21) is essential for the student who wishes to examine the question carefully; and may be regarded as finally putting an end to any idea of bare tenure as an existing means of establishing a peerage right. (*See* also Cruise on *Dignities*, 2nd ed., pp. 60 *et seq.*)

The main attribute of a peerage is that hereditary and inalienable quality which ennobles the blood of the holder and his heirs, or, as a great judge put it in 1625, in the earldom of Oxford case, "he cannot alien or give away this inheritance because it is a personal dignity annexed to the posterity and fixed in the blood" (Dodridge, J., at p. 123, Sir W. Jones's *Reports*).

Dukes.—Until the reign of Edward III. the peerage consisted only of high ecclesiastics, earls and barons. The earls were barons with their special name of dignity added, and their names always appear on the rolls before those of the barons. In 1337 King Edward III. created his son, the Black Prince, duke of Cornwall, giving him precedence over the rest of the peerage. Subsequently several members of the royal family were created dukes, but no subject received such an honour until 50 years later, when Richard II. created his favourite, Robert de Vere, earl of Oxford, duke of Ireland (for life). The original intention may have been to confine the dignity to the blood royal, since, with the exception of de Vere, it was some years before a dukedom was again conferred on a subject.

Marquesses.—In 1385 Richard II. had created Robert de Vere marquess of Dublin, thus importing an entirely new and unknown title into the peerage. The grant was, however, only for life, and was, in fact, resumed by the Crown in 1387, when its recipient was created duke of Ireland.

Viscounts.—Under the name of viscount (*q.v.*) Henry VI. added yet another order, and the last in point of time, to the peerage, creating in 1440, John, Baron Beaumont, Viscount Beaumont and giving him precedence next above the barons. The name of this dignity was borrowed from the Continent, having been in use for some time as a title of honour in the king's French possessions. None of the new titles above mentioned ever carried with them any official position; they were conferred as additional honours on men who were already members of the peerage.

Spiritual Peers.—The application of the hereditary principle to temporal peerages early differentiated their holders from the spiritual peers. Both spiritual and temporal peers were equally lords of parliament, but hereditary pretensions on the one side and ecclesiastical exclusiveness on the other soon drew a sharp line of division between the two orders. Gradually the temporal peers, strong in their doctrine of "ennobled" blood, came to consider that theirs was an order above and beyond all other lords of parliament, and before long, arrogated to themselves the exclusive right to be called peers, and as such the only persons entitled to the privileges of peerage.

The pretensions of the lay peers were not admitted without a struggle on the part of the prelates, who made the mistake of aiming at the establishment of a privileged position for their own order while endeavouring to retain every right possessed by their lay brethren. They fell between two stools, lost their position as peers and were beaten back in their fight for ecclesiastical privilege. For themselves Churchmen never claimed the privilege of trial by peers, and when arraigned, alleged to be altogether beyond secular authority. The Standing Orders of the House of Lords for 1625 contain the statement that "Bishops are only Lords of Parliament and not Peers" (*Lords Journals*, iii. 349). In 1640 the "Lords Spiritual" were altogether excluded from the House of Lords by act of parliament, and were not brought back until the second year of the Restoration.

Henry VIII. and the Peerage.—The reign of Henry VIII. brought about far-reaching changes in the position of the peerage. When that king ascended the throne the hereditary element was in a decided minority, but the balance was rapidly redressed until a bare hereditary majority was secured and the dissolution of the monasteries made possible. The peers, many now grown fat on abbey lands, at once began to consolidate their position; precedents were eagerly sought for, and the doctrine of ennobled blood began to find definite and vigorous expression. So long, the peers declared, as there is any ennobled blood, a peerage must exist; and it can be extinguished only by act of parliament, failure of heirs or upon corruption of blood by attainder.

Surrender of Peerages.—From the doctrine of nobility of blood is derived the rule of law that no peerage (a Scots peerage is under Scots Law, which admits surrender) can be surrendered, extinguished or in any way got rid of unless the blood be corrupted. The rule is well illustrated by the earldom of Norfolk case (*Law Reports* [1907], A.C. 10), in which its development was traced, and the principle authoritatively confirmed. Historically, there is little to support such a decision, and, indeed, this rigid application of the law is of comparatively recent date. Without doubt king, nobles and lawyers alike were all agreed, right down to Tudor days, that such surrenders were entirely valid. Many certainly were made, but, according to the decision of 1906, any living heirs of line of those nobles who thus got rid of their peerage honours can, if their pedigrees be provable and no attainders bar the way, come to the House of Lords with a fair chance of reviving the ancient honours.

Attainder and Corruption of Blood.—The application of the doctrine of corruption of blood to peerages arises out of their close connection with the tenure of land, peerage dignities never having been regarded as personal until well on into the 14th century. Conviction for any kind of felony—and treason originally was a form of felony—was always followed by attainder. This resulted in the immediate corruption of the blood of the offender, and its capacity for inheritance was lost for ever. Such corruption, with all its consequences, could be set aside only by act of parliament. This stringent rule of forfeiture was to some extent mitigated by the passing, in 1285, of the statute De Donis Conditionalibus (*q.v.*), which made possible the creation of estates tail, and when a tenant-in-tail was attainted forfeiture extended only to his life interest. The statute De Donis was soon applied by the judges to such dignities as were entailed (*e.g.*, dignities conferred by patent with limitations in tail), but it never affected baronies by writ, which were not estates in tail but in the nature of estates in fee simple descendible to heirs-general. In the reign of Henry VIII. an act was passed (1534) which brought estates tail within the law of forfeiture, but for high treason only. The position then became that peerages of any kind were forfeitable by attainder following on high treason, while baronies by writ remained, as before, forfeitable for attainder following on felony. In 1708, just after the union with Scotland, an act was passed by which, on the death of the Pretender and three years after Queen Anne's death, the effects of corruption of blood consequent on attainder for high treason were to be abolished, and the actual offender only punishable (stat. 7 Anne, c. 21, sec. 10). Owing to the 1745 rising, the operation of this act was postponed until the decease

of the Pretender and all his sons (stat. 17 Geo. II. c. 39, sec. 3). In 1814, forfeiture for every crime other than high and petty treason and murder, was restricted to the lifetime of the person attainted (stat. 54 Geo. III. c. 145). Finally, in 1870, forfeiture, except upon outlawry, was altogether abolished, and it was provided that "no judgment of or for any treason or felony should cause any attainder or corruption of blood, or any forfeiture or escheat."

In many cases there have been passed special parliamentary acts of attainder and forfeiture, and these, of course, operate apart from the general law. In any event, attainder and forfeiture of a dignity, whether resulting from the rules of the common law or from special or general acts of parliament can only be reversed by act of parliament.

Growth of the Lords.—The numbers of the House of Lords grew steadily throughout the Tudor period, and during the reign of the first two Stuarts underwent a still greater increase. In the Great Rebellion the majority of the peers were the king's stoutest supporters, and thus inevitably involved themselves in the ruin of the royal cause. Under Cromwell they disappeared as a legislative body and did not return to their ancient place until the restoration of Charles II.

From the reign of William of Orange the peerage has been freshened by a steady stream of men who, as a rule, have served their country as statesmen, judges, sailors and soldiers. By the Act of Union with Scotland (1707) the Scottish parliament was abolished; but the Scottish peerage was given the privilege of electing, for each parliament of Great Britain, 16 of their number to represent them in the House of Lords. Further creations in the Scottish peerage were no longer to be made. The effect of this act was to leave the great majority of the Scottish peers outside the House of Lords, since only 16 of their number were to become lords of parliament. Close upon 100 years later Ireland was united with Great Britain, the Irish parliament being merged in the parliament of the United Kingdom of Great Britain and Ireland. Twenty-eight Irish peers were to be elected for life by their order to represent it in the House of Lords. One archbishop and three bishops were also chosen in turn to represent the Irish Church in the House of Lords, but when that Church was disestablished in 1867 the spiritual lords lost their seats. The merger of the three kingdoms had an important effect on their peerages. Every peer, in his own country, had been a lord of parliament by hereditary right. The English peer (and, as the Acts of Union were passed, the peer of Great Britain and the peer of the United Kingdom) continued by hereditary right a lord of parliament. Although the Scottish and Irish peers lost this right by the two Acts of Union, they retained every other privilege of peerage. Henceforth they were to be lords of parliament only when their fellow peers elected them.

The erection of southern Ireland into a self-governing dominion of the Crown has indirectly but definitely affected the status of the Irish peerage. This peerage belonged to the old united Ireland; and cannot to-day arbitrarily be divided between its two halves. The Irish Free State Constitution Act, 1922, together with the machinery acts dependent thereon, has destroyed the procedure whereby Irish representative peers are elected; whether intentionally or by accident is not known. Existing representative peers, having been elected for life, remain in the House of Lords, but no vacancies can henceforth be filled. The Irish peerage will thus slowly diminish in numbers as existing peerages die out.

The modern meaning of the term peerage can now be more clearly defined. It will be noted that there have always been separate peerages of England, Ireland and Scotland. After the union of England with Scotland new creations became of the peerage of Great Britain, and after the union of Great Britain with Ireland: of the United Kingdom of Great Britain and Ireland; and now, since the advent of the Irish Free State, probably we must speak of the "United Kingdom of Great Britain and Northern Ireland." Many members of the House of Lords hold peerages in several of these groups.

Several attempts have been made to limit the absolute rights of peers to a writ of summons, but this is a question which belongs rather to the history of the House of Lords as a legislative chamber. It will suffice here to note that in 1856 an attempt was made to create one of the judges a life peer, but the House, after long debate, rejected the writ, and a patent of customary form had to be followed. In 1876 legislation was passed creating two lords of appeal (with power to appoint two more) with a right to sit and vote during the holding of office. In 1887 further legislation conferred on all lords of appeal and ex-lords of appeal life peerages.

The Scottish Peerage.—The Scottish peerage, like that of England, owes its origin to feudalism. When the Scottish earls and barons came to parliament, they did not withdraw themselves from the rest of the people, it being the custom for the estates of Scotland to deliberate together, and this custom persisted until the abolition of their parliament by the Act of Union in 1707. The territorial spirit of the nobles inevitably led them to regard the honour as belonging to, and inseparable from, their land, and until comparatively late in Scottish history there is nowhere any record of the conferment of a personal dignity unattached to land such as that conferred in England on Beauchamp by Richard II. This explains the frequent surrenders and altered grants which are so common in Scottish peerage history, and which, in sharp distinction to the English rule of law, are there regarded as perfectly legal. To-day there exists no Scottish dukedom (except the royal dukedom of Rothesay), marquessate or viscounty created before the reign of James VI. of Scotland (and I. of England). Of the existing Scottish peerages 63 were created in the period between James's accession to the English throne and the Act of Union. There are now only 87 in all.

The Irish Peerage.—The Anglo-Norman conquerors of Ireland carried with them the laws and the system of tenure to which they were accustomed in England, and consequently the growth of the baronage and the establishment of parliamentary government in Ireland proceeded on parallel lines with the changes which occurred in England. Until the reign of Henry VIII. the Irish were without representation in parliament, but gradually the Irish were admitted, and by the creation of new parliamentary counties and boroughs were enabled to elect representatives. In 1613 the whole country shared in representation (Ball's *Legislative Systems of Ireland*). Just as James I. had added many members to the Scottish peerage, so he increased the number of Irish peers.

On the death of a representative peer of Scotland a vacancy occurs and a new election takes place, but in accordance with modern practice promotion to a United Kingdom peerage does not vacate the holder's representative position (May's *Parliamentary Practice*, p. 11 n.). Scottish and Irish peers, if representative, possess all the privileges of peerage and parliament enjoyed by peers of the United Kingdom; if non-representative all privileges of peerage, except the right to a writ of summons to attend parliament and to be present at and vote in the trial of peers.

Though many peers possess more than one peerage, and frequently of more than one country, only that title is publicly used which is first in point of precedence. Every peerage descends according to the limitations prescribed in its patent of creation or its charter, and where these are non-existent (as in the case of baronies by writ) to heirs-general. (*See* ABEYANCE.)

In dealing with English dignities it is essential to realize the difference between a mere title of honour and a peerage. The Crown, as the fountain of honour, is capable of conferring upon a subject not only any existing title of honour, but may even invent one for the purpose. So James I. instituted an order of hereditary knights which he styled baronets, and Edward VII. created the duchess of Fife "Princess Royal"—a life dignity. The dignities of prince of Wales, earl marshal and lord great chamberlain have been for centuries hereditary, and though of high court and social precedence, of themselves confer no right to a seat in the House of Lords—they are not peerages.

There is no limitation on the power of the Crown as to the number of United Kingdom peerages which may be created. As

to Scotland, the Act of Union with that country operates to prevent any increase in the number of Scottish peerages, and consequently there have been no creations since 1707, with the result that the Scottish peerage, as a separate order, is gradually approaching extinction. The Irish peerage is supposed always to consist of 100 exclusively Irish peers, and the Crown (before the erection of the Irish Free State) had power to grant Irish peerages up to the limit. When the limit was reached no more peerages might be granted until existing ones had become extinct or their holders succeeded to United Kingdom peerages. Only four lords of appeal in ordinary may hold office at any one time. The number of archbishops and bishops capable of sitting in the House of Lords is fixed by various statutes at 26.

Since party government became the rule, the new peerages have usually been created on the recommendation of the prime minister of the day, though the Crown, especially in considering the claims of royal blood, is believed in some instances to take its own course; and, constitutionally, such action is entirely legal. By far the greater number of peerage honours granted during the last two centuries have been rewards for political services. The roll of the lords spiritual and temporal for the session of parliament assembling Feb. 1928 numbered 740.

Privileges of Peerage.—As centuries have gone by and customs changed, many privileges once keenly asserted have either dropped out of use or been forgotten. The most important now in being are a seat in the House of Lords and the right to trial by peers on any charge of treason or felony. Whatever the origin of this latter right, and some date it back to Saxon times (Trial of Lord Morley, 1678, *State Trials*, vii. 145), Magna Carta has always been regarded as its confirmatory authority.

The peers have always strongly insisted on this privilege of trial by their own order, and several times the heirs of those wrongly condemned recovered their rights and heritage on the ground that there had been no proper trial by peers (*R.D.P.*, v. 24). In 1442 the privilege received parliamentary confirmation (stat. 20 Henry VI. c. 9). If parliament is sitting the trial takes place before the House of Lords in full session, *i.e.*, the court of our lord the king in parliament; if not, then before the court of the lord high steward. The office of lord high steward was formerly hereditary, but has not been so for centuries and is now only granted *pro hac vice*. When necessity arises, the Crown issues a special commission naming some peer (usually the lord chancellor) lord high steward *pro hac vice* (Blackstone's *Comm.*, iv. 258). When a trial takes place in full parliament a lord high steward is also appointed, but his powers there are confined to the presidency of the court, all the peers sitting as judges of law as well as of fact. Should the lord high steward be sitting as a court out of parliament, he summons a number of peers to attend as a jury, but rules alone on all points of law and practice, the peers present being judges of fact only. Whichever kind of trial is in progress, it is the invariable practice to summon all the judges to attend and advise on points of law. The distinction between the two tribunals was fully discussed and recognized in 1760 (Trial of Earl Ferrers, Foster's *Criminal Cases*, 139). The most recent trial was that of Earl Russell for bigamy (reported 1901, A.C. 446).

Peeresses and non-representative peers of Ireland and Scotland have, with the exception of the right to sit in the House of Lords and its attendant privileges, every peerage privilege. In 1922 Sibyl Viscountess Rhondda presented a petition claiming the right to a writ of summons. The claim was heard and re-heard before the Committee for Privileges and eventually rejected. This decision has disposed of the claims of peeresses in their own right, under the existing law, to sit in the House of Lords. A widowed peeress retains her privilege of peerage while unmarried, but loses it if she marries a commoner (Co. Litt. 166; *Cowley* v. *Cowley* [1901] A.C. 450).

The children of peers are commoners. The eldest son of a peer of the rank of earl (and above) is usually known socially by the name of his father's next peerage, but the courtesy nature of such title is clearly indicated in every public or legal document, the phraseology employed being "John Smith, Esq., commonly known as Viscount Blackacre." Several cases are on record in which peers' eldest sons have actually borne courtesy titles not possessed as peerage honours by their fathers, but inasmuch as such are only accorded by courtesy, no question of peerage privilege arises. The younger sons of dukes and marquesses by custom use the prefix "Lord" before one of their Christian names, and all the daughters of earls as well as of dukes and marquesses are entitled similarly to style themselves "Lady," on the principle that all the daughters are equal in rank and precedence. The younger sons of earls and all the younger children of viscounts and barons, including lords of appeal, use the prefix "Honourable" before one of their Christian names, but this style is one of written address and reference only. Usually, when the direct heir of a peer dies, his children are given, by the Crown, on the death of the peer, the courtesy titles and precedence they would have enjoyed had their father actually succeeded to the peerage.

An alien may be created a peer, but while remaining an alien cannot sit in the House of Lords, nor, if a Scottish or Irish peer, can he vote at elections for representative peers.

Claims to peerages are of two kinds: (1) of right, (2) of grace. In theory the Crown, as the fountain of honour, might settle any claim without reference to the House of Lords, and issue a writ of summons to its petitioner. This would not in any way prevent the House of Lords from examining the patent and writ of summons when the favoured petitioner or any heir claiming through him came to take his seat. If of opinion that the patent was illegal the House might refuse admittance, as it did in the Wensleydale case. In the case of a petitioner who has persuaded the Crown to terminate in his favour as a co-heir the abeyance of an ancient barony and who has received his writ of summons, the matter is more difficult. The House cannot refuse to admit any person properly summoned by the Crown, as the prerogative is unlimited in point of numbers; but it can take into account the precedence of the newcomer. The Crown, therefore, unless there can be no question as to origin and pedigree, seldom terminates an abeyance without referring the matter to the House of Lords, and invariably so refers all claims which are disputed or which involve any question of law.

The Committee for Privileges, which for peerage claims is usually constituted of the law lords and one or two other lords interested in peerage history, sits as an ordinary court of justice and follows all the rules of law and evidence. The attorney-general attends as adviser to the committee and to watch the interests of the Crown. According to the nature of the case the committee reports to the House, and the House to the Crown, that the petitioner (if successful) (1) has made out his claim and is entitled to a writ of summons, or (2) has proved his co-heirship to an existing peerage, and has also proved the descent of all co-heirs that can seasonally be traced. In the first case the writ of summons is issued forthwith, but the second, being one of abeyance, is a matter for the pleasure of the Crown, which need not be exercised at all, but, if exercised, may terminate the abeyance in favour of any one of the co-heirs.

During the parliamentary session of 1926 the House of Lords appointed a select committee to examine the history of abeyant peerages and to report on the advisability of limiting future claims. After debate on the report, the House resolved that these claims ought not to be considered where long abeyance has existed and where the claimants possess only a small fraction of the original heirship. The resolution of the House was duly reported to the Crown. The recommendation of the House does not, and, in law, cannot affect the prerogative of the Crown to terminate any abeyance, but there can be little doubt that the representations made will have due weight with the advisers of the Crown in the consideration of all future claims. The report of and evidence taken by the committee is printed as a House of Lords paper (1927) and should be carefully studied by all interested in peerage history. (G. El.)

PEEWEE, the name (from their cry) of two North American birds of the genus *Myiochanes* (fam. *Tyrannidae*). The wood peewee (*M. virens*) is a little bird about 6 in. long, dark olive

above, with a whitish throat and yellowish belly. The name closely represents its musical call. It breeds in North America and migrates in winter through eastern Mexico to South America. West of longitude 100° it is replaced by *M. richardsonii*, the western wood peewee, which has no olive tinge above, and has the wings and tail slightly longer. It also winters in S. America.

PEEWIT, an alternative name for the lapwing (*Vanellus vanellus*), from its cry. (*See* LAPWING.)

PEGASUS (from Gr. πηγός compact, strong, not from πηγή, a spring), a winged horse said to have sprung from the trunk of the Gorgon Medusa when her head was cut off by Perseus After his service to Bellerophon (*q.v.*) and the latter's fall, Pegasus served Zeus (Hesiod, *Theog.* 281). Later authors identify him with the constellation Pegasus or Equus. The spring Hippocrene or Hippucrene (Horsewell) on Mt Helicon is said to have sprung up from a blow of his hoof; for the connection between horses, or horse-shaped *daimones,* and water, *see* POSEIDON. Hence the erroneous derivation of πήγασος from πηγή. Hence also the fancy of modern poets (first in Boiardo, *Orlando inamorato*) that he is the horse of the Muses and hence a symbol of poetry

See F. Hannig in *Breslauer philologische Abhandlungen* (1902), vol. viii., pt. 4, and in Roscher's *Lexikon der Mythologie* (bibl.).

PEGGING THE EXCHANGE. The phrase and practice of "pegging the exchange" finds its origin in the World War It may be defined as consisting of continued governmental or official action to maintain the foreign exchange value of a country's currency against the principal gold currencies at par or at any fixed point. Thus, during the World War, the Allied Governments pegged their respective rates of exchange upon New York at a point slightly below parity, while from 1926 to 1928 the French Government maintained the "de facto" stabilization of the franc, virtually another name for pegging the franc at a rate which quickly settled down at 124 francs to the pound sterling.

Pegging the exchange theoretically means the maintenance of the exchange between an upper and a lower limit, and that the appreciation as well as the depreciation of the home currency must be prevented.

As shown in the article upon foreign exchange (*q.v.*), a rate of exchange is the price of one currency in terms of another, and this price depends upon supply and demand. Hence, when a Government decides to peg the rate, it must adopt one of two alternatives The first, which evasion rapidly renders impracticable, is to fix the rate by law. This, when tried, has nearly always failed. The second is for the Government, directly or through its agents, to buy and sell on the world's exchange markets its own and foreign currencies in such a way and in such quantities as to counteract immediately any attempt of the rate to go beyond the limits within which the rate is pegged.

During the World War the Allies were largely dependent upon the United States for food-stuffs and munitions The purchase of these involved a steady demand for dollars, and as there was no counteracting supply of dollars at the disposal of the Allies —for export trade to the States was perforce curtailed by the concentration of the Allies' productive energies upon the war— the allied currencies showed a steady tendency to depreciate against the dollar To consider England alone: as early as 1915, the British Government took steps to "maintain" the exchange, though no definite peg was inserted. These steps consisted of the acquisition of dollars by the British Government and their sale in New York by Messrs Pierpont Morgan, who were agents to the British Government, in such quantities as to balance the day to day demand for dollars arising from the Allies' purchases of American commodities. So long as the supply was equal to the demand, the exchange was automatically maintained.

The problem before the British Government was how to acquire dollars in sufficient quantity to meet the abnormal war demand. To solve this, they depended partly upon dollar loans in America, and partly on the large volume of sound American securities held by British nationals as a result of the heavy pre-war investments made by Great Britain in America. These last were acquired by the British Treasury, transferred to their New York agents, and their sale provided the necessary supply of dollars.

Various methods were adopted whereby the Treasury gained control of American securities. Originally, the British Government contented themselves with an appeal to holders of eligible stocks, the appeal being based partly upon patriotism, and partly on the fact that a highly attractive price was offered by the Treasury. This met with a certain degree of response. Later on, peaceful methods of persuasion were reinforced by a special two shillings in the pound income tax imposed upon dividends accruing from such American securities as were required by the Treasury and which the holders declined to surrender Finally, the power of the Defence of the Realm Act was invoked, and these securities were forcibly requisitioned, the original holder receiving a fair price as fixed by the Treasury

When the United States entered the World War these expedients were no longer necessary, as the United States Government could borrow dollars from its own nationals, and lend them to the Allied Governments in such quantities as proved necessary. This kept the peg firmly in place, while the question of repayment was left over till after the war. It will be seen that the debt to America took two forms. One consisted of the loans raised by the Allies on Wall street, due directly to the American investor. The other was debt due to the American government.

The war provided the outstanding example of exchange pegging Other examples can be found in the post-war reconstruction period The method usually employed is for the Government or central bank of the country concerned to have credits opened in London and New York. In case of need, these are drawn upon, and the resulting sterling or dollars sold in the market in amounts sufficient to keep the peg in place. (*See* also EXCHANGE, FOREIGN)

(N E C)

PEGMATITE, the name given by Hauy to those masses of graphic granite which frequently occur in veins. They consist of quartz and alkali felspars in crystalline intergrowth (*see* PETROLOGY) The term (from Gr πῆγμα, a bond) was subsequently used by Naumann to signify also the coarsely crystalline veins rich in quartz felspar and muscovite, which often in great numbers ramify through outcrops of granite and the surrounding rocks This application of the name has now obtained general acceptance, and has been extended by many petrologists, to include vein-rocks of similar structure and geological relationships, which occur with syenites, diorites and gabbros Only a few of these pegmatites have graphic structure or mutual intergrowth of their constituents Many of them are exceedingly coarse-grained; in granite-pegmatites the felspars may be several feet or even yards in diameter, and other minerals such as mica, apatite and tourmaline often occur in gigantic crystals. The pegmatites are always in visible association with plutonic intrusions and they consist largely of minerals similar to those characteristic of the particular magma from which they have been derived.

On the whole pegmatites are most abundant along with acid rocks, especially granites, though they are also well known in association with syenites and gabbros As a rule they are more acid in composition than the average of the parent magma, and this fact has a bearing on their mode of origin. The coarsely crystalline structure is not difficult to explain on physico-chemical principles. The pegmatites are shown by field-evidence to belong to a very late stage in the cooling of the parent magma, and many of them contain minerals rich in water and a number of elements of low atomic weight, such as are known to have a powerful effect in depressing the freezing-points of minerals in silicate melts: such are fluorine, chlorine and boron The final residue of the magma became enriched in water, in these elements, and in others capable of forming volatile compounds with them, such as tin and tungsten Now such a solution would remain fluid down to a very low temperature, and would be extremely mobile, thus facilitating free diffusion of molecules and thereby favouring the formation of large crystals. Further, such a residual solution would naturally tend towards the composition of a eutectic, giving rise to the simultaneous crystallization of two or more minerals in graphic intergrowth.

Among the more common of the minerals above referred to are tourmaline, which contains both boron and fluorine, apatite,

which has varieties with either fluorine or chlorine, or both; muscovite and gilbertite both contain hydrogen as hydroxyl and fluorine; topaz may carry as much as 20% of fluorine. Among the other elements of low atomic weight beryllium is found as beryl and lithium in various lithia-micas, lepidolite, zinnwaldite and spodumene. Tin and tungsten give rise to cassiterite and wolfram, which are common in pegmatites.

There exists in nature a complete transition from pegmatites having, for example, the exact composition of a granite, to veins of nearly pure quartz; many of the last named contain a workable quantity of some metalliferous ore or metal. This transition may be seen not only by a comparison of the different veins of a district, but sometimes occurs along the extent of one individual vein. Nearest to or within the parent granite it may consist of quartz, felspar and mica, with accessories: when traced along the strike away from the parent granite the felspar and mica progressively decrease till the more distant parts constitute a quartz-vein, which may be either metalliferous or barren. This is an example of the process of differentiation applied to a case which may be of great practical importance. Many such instances occur in mining geology (*see* MINERAL DEPOSITS).

The pegmatites of the syenite group, especially those of southern Norway, are remarkable for the number of minerals containing rare earths, which are associated with an unusually high percentage of alkalis, especially soda, in the parent magma. Gabbro pegmatites are often extremely rich in apatite, which is for the most part the chlorine-bearing variety, whereas the apatite of acid pegmatite carries fluorine. Many of the finest specimens of minerals in museums have come from cavities in pegmatites, where there was room for the development of crystal faces.

(R. H. RA.)

PEGOLOTTI, FRANCESCO BALDUCCI (*fl.* 1315–40), Florentine merchant and writer, was a factor in the service of the mercantile house of the Bardi, and in this capacity he was at Antwerp from 1315 (or earlier) to 1317; in London in 1317 and apparently for some time after; in Cyprus from 1324 to 1327, and also in 1335, when he obtained from the king of Little Armenia (*i.e.*, mediaeval Cilicia, etc.) a grant of privileges for Florentine trade. Between 1335 and 1343, he compiled his *Libro di divisamenti di paesi e di misuri di mercatanzie e d'altre cose bisognevoli di sapere a' mercatanti*, commonly known as the *Pratica della mercatura* (the name given it by Pagnini). Beginning with a sort of glossary of foreign terms then in use for all kinds of taxes or payments on merchandise as well as for "every kind of place where goods might be bought or sold in cities," the *Pratica* next describes some of the chief trade routes of the 14th century, and many of the principal markets then known to Italian merchants; the imports and exports of important commercial regions; the business customs prevalent in those regions; and the comparative value of the leading moneys, weights and measures.

There is only one ms. of the *Pratica*, viz., No. 2,441 in the Riccardian Library at Florence (241 fols. occupying the whole volume), written in 1471; and one edition of the text, in vol. iii. of Gian Francesco Pagnini's *Della Decima e delle altre gravezze imposte dal commune di Firenze* (Lisbon and Lucca—really Florence—1766); Sir Henry Yule, *Cathay*, ii. 279–308, translated into English the most interesting sections of Pegolotti, with valuable commentary (London, Hakluyt society, 1866). *See* also W. Heyd, *Commerce du Levant*, ii. (Leipzig, 1886); H. Kiepert, in *Sitzungsberichte der philos.-hist. Cl. der berliner Akad.* (Berlin, 1881); C. R. Beazley, *Dawn of Modern Geography*, iii. (Oxford, 1906).

PEGU, a town and former capital of Lower Burma, giving its name to a district and a division. The town is situated on a river of the same name, 47 m. N.E. of Rangoon by rail; pop. (1921) 18,769. It is still surrounded by traces of the old walls, about 40 ft. wide, on which have been built the residences of the British officials. The most conspicuous object is the Shwe-mawdaw pagoda, 324 ft. high, considerably larger and even more holy than the Shwe-dagon pagoda at Rangoon. Pegu is said to have been founded in 573, as the first capital of the Talaings; but it was as the capital of the Toungoo dynasty that it became known to Europeans in the 16th century. About the middle of the 18th century it was destroyed by Alompra; but it rose again, and was important enough to be the scene of fighting in both the first and second Burmese Wars. It gave its name to the province (including Rangoon) which was annexed by the British in 1852.

The district, which was formed in 1883, consists of a portion of the forested Pegu Yomas and an alluvial tract between the Pegu Yoma range and the Sittang river: area, 4,083 sq.m.; pop. (1921) 445,620, showing an increase of 63,454 in the decade. Christians numbered nearly 9,750, mostly Karens. Almost the only crop grown is rice, which is exported in large quantities to Rangoon. The district is traversed by the railway, and also crossed by the Pegu-Sittang canal, navigable for 85 m., with locks.

The division of Pegu comprises the districts of Rangoon town, Hanthawaddy, Insein, Tharrawaddy, Pegu and Prome, lying east of the Irrawaddy: area 13,707 sq.m.; pop. (1921) 2,030,044.

PÉGUY, CHARLES (1873–1914), French author and poet, born at Orleans in 1873, came of a family which had been vine-growers for generations, and was proud of his peasant origin. He was educated at the *École Normale* and at the Sorbonne. The object of his life is perfectly indicated in the dedication of his first book, *Jeanne d'Arc* (1897), "à toutes celles et à tous ceux qui auront vécu . . . pour l'établissement de la République socialiste universelle." His works from that time until his death in Sept. 1914 are devoted to the glory of France. He was a determined republican; at the same time he was a devout Catholic. A mystical lover of France, and yet a strong socialist, he puzzled anti-clerical socialists and Catholic nationalists equally. His *Notre Patrie,* in which his views of what was necessary for the regeneration of the republic were set out, was written in 1905, but his most important prose works and the majority of his poems were written between 1910 and 1914. *Les Cahiers de la Quinzaine,* founded by him in 1900, were devoted to the expression of truth without regard to party, and in them Péguy's development, and the development of the "new France" he did so much to inspire, may be traced for over a decade. They were primarily imbued with his spirit, though in their pages many now well-known writers first came into public notice. For him truth was not to be found in compromise, and his extreme views were pronounced even at the risk of a subsequent *volte-face*. At the *École Normale* he came under the influence of Bergson, to whom he has done homage in his *Note sur M. Bergson* (1914). He kept his own little shop in the shadow of the Sorbonne, where he was continually amending his works. There he sold the *Cahiers*. He lived in the country, walked into Paris every morning, and brought with him something of the *province*. When war came in 1914 he refused a captaincy, because he wished to go on foot with his men. He fell leading a company on the first day of the battle of the Marne. The first volumes of his collected works were published in 1916.

See R. Johannet, *Péguy et ses Cahiers* (1914); J. E. Roberty, *Charles Péguy* (1916); A. Suarès, *Péguy* (1916); D. Halévy, *Charles Péguy et les Cahiers* (1918); M. Péguy, *La Vocation de C. Péguy* (1926).

PEINE, a town in the Prussian province of Hanover, 16 m. by rail W.N.W. of Brunswick, on the railway to Hanover and Hamburg. Pop. (1925) 17,036. Peine was at one time a strongly fortified place, and until 1803 belonged to the bishopric of Hildesheim. Its industries include iron and steel works, breweries and brickyards, and the manufacture of soap, sugar, malt, machinery and boots. There are also large cattle markets held here.

PEINE FORTE ET DURE, the term for a barbarous torture inflicted on those who, arraigned of felony, refused to plead and stood silent, or challenged more than 20 jurors, which was deemed a contumacy equivalent to a refusal to plead. Before he could be tried, a prisoner must plead "guilty" or "not guilty." By the Statute of Westminster, 1275, the penalty was "strong and hard imprisonment," but in 1406 pressing to death by heavy weights was substituted. This was abolished in 1772; "standing mute" being then made equivalent to conviction. By an act of 1827 a plea of "not guilty" was to be entered against any prisoner refusing to plead, and that is the rule to-day. An alternative to the *peine* was the tying of the thumbs tightly together with whipcord until pain forced the prisoner to speak. This was said to be a common practice at the Old Bailey up to the 19th century.

The last recorded instance of the infliction of the *peine* was

in 1741 at Cambridge assizes, when a prisoner was so put to death; the penalty of thumb-tying having first been tried. The only known American instance was in 1692 at Salem, Massachusetts, when Giles Corey, accused of witchcraft, was pressed to death.

PEIPING: *see* PEKING.

PEIPUS, a lake lying between north-west Russia and Estonia, also known as PEIPSI or CHUDSKOYE OZERO. The boundary between the two countries passes northwards for 60 m. through the centre of the lake, leaving the east bank in Russia and the west in Estonia, but turns east towards the north, thus including the whole northern shore and the outlet of the Narova river, in Estonia Including its southern extension, sometimes known as Lake Pskov or Pihkwa, it has an area of 1,356 sq m. Its shores are flat and sandy, and in part wooded; its waters are deep, and they afford valuable fishing The lake is fed by the Velikaya, which enters it at its southern extremity, and by the Embach or Ema, along which timber is brought to Tartu, and which flows in half way up the western shore of the lake. It drains into the Gulf of Finland by the Narova, which issues at its north-east corner.

PEIRAEEUS or **PIRAEUS** (Gr Πειραιεύς), the port of Athens, with which its story is inseparably connected About 5 m S W of Athens, the sandy bay of Phaleron is closed westward by a rocky promontory which falls abruptly also landwards into the plain Its highest point, called Munychia, is at the north-east end; the lower plateau, Acté, stretches seaward to south-west, beyond the saddle which connects two small coves, Munychia and Zea, on the south-east coast, with the completely landlocked basin of Peiraeeus, with its inner port, Cantharus, running northward between Munychia hill and the detached ridge, Eëtioneia, which dominates the north side of the entrance In early days Athenians used only the sandy Phaleron for sea traffic It was Themistocles who persuaded the Athenians to fortify and utilize Peiraeeus, about 493 B.C, for their new fleet The "long walls" from the base of Munychia hill to Athens were built soon after 460 B.C., and the town of Peiraeeus itself was laid out on a rectangular plan by the architect, Hippodamus of Miletus, probably at the suggestion of Pericles. The fortress of Eetioneia was added during the Peloponnesian war. Traces remain of the ship-houses surrounding Zea and Munychia; the town-plan is followed by the modern streets; and the tomb of Themistocles, on the Act, and the great gate of Fort Eëtioneia are conspicuous (*See* under ATHENS.)

PEIRCE, BENJAMIN (1809–1880), American astronomer and mathematician, son of a Harvard university librarian and historian, was born at Salem, Mass, on April 4, 1809. He graduated from Harvard in 1825 and, returning there as a tutor in mathematics in 1831, continued to teach in the university till his death nearly 50 years later. Tributes concur in the estimate that he was a wonderfully inspiring teacher. In the United States he was the leading mathematician of his time. In Europe he was elected an associate of the Royal Astronomical Society, a foreign member of the Royal Society of London, a correspondent of the British Association for the Advancement of Science, an honorary fellow of the Royal Society of Edinburgh, and a correspondent of the Gesellschaft der Wissenschaften in Göttingen. About one-quarter of Peirce's publications deal with topics in pure mathematics and three-quarters with topics mainly in the fields of astronomy, geodesy and mechanics. Of his 11 works, in 12 volumes, six were elementary texts some of which went through several editions. Among his other works were the notable *Analytic Mechanics* (1855), and the remarkably original *Linear Associative Algebra* (lithographed edition of 100 copies, 1870; new ed. by his son C. S. Peirce in *American Journal of Mathematics,* vol. iv., 1881, reprinted 1882), anticipating important work of Study and Scheffers. There are many references in scientific literature to Peirce's criterion for the rejection of doubtful observations, and it was only recently shown (*Popular Astronomy,* 1920) that this was fallacious. The computation of the general perturbations of Uranus and Neptune, and the resulting controversy with Leverrier, was the first work to extend Peirce's reputation. He died on Oct. 6, 1880.

See R. C. Archibald, *Benjamin Peirce 1809–1880, Biographical Sketch and Bibliography* (1925). (R. C A)

PEIRCE, CHARLES (SANTIAGO) SANDERS (1839–1914), American philosopher and logician, was born at Cambridge, Mass, on Sept. 10, 1839 He was the son of Benjamin Peirce, the Harvard mathematician. He graduated at Harvard in 1859, and at the Lawrence scientific school in 1863. Soon thereafter he joined the staff of the U S. coast survey, where his work on the problems of geodesy and his researches on the pendulum received wide recognition In 1877 he was the first American representative to the International Geodesic congress In 1880–81 he gave a series of lectures on philosophical logic at Johns Hopkins university; in the spring of 1903 a series on pragmatism at Harvard and another in 1903–04 on logic at the Lowell institute, Boston He introduced the principle of pragmatism into philosophy, defining his theory in the *Popular Science Monthly* for January 1878 Though he did not there call it *pragmatism,* he is known to have originated the word as well as the idea It is said to have first appeared in print in his article in Baldwin's *Dictionary of Philosophy,* 1901 To avoid confusion with the theories of his contemporaries, he later changed the name to pragmaticism He died at Milford, Pa, on April 14, 1914 In addition to his contributions in mathematical logic, meteorology, psychophysics, philology, and other subjects, his published works include. five papers on logic in *Proc. of Amer. Acad Arts and Sciences,* vol. 7 (1867); *Photometric Researches* (1878); *Studies in Logic* (1883); "The Architecture of Theories," *Monist,* vol i (1890); "What Pragmatism is," *Monist,* vol xv. (1905).

PEIRESC, NICHOLAS CLAUDE FABRI DE (1580–1637), French archaeologist, naturalist scholar and promoter of learning, was born on Dec. 1, 1580, at Beaugensier, Provence Intended by his father for the law he early showed a preference for the study of antiquities, and from 1599 to 1602 travelled in Italy visiting the museums and galleries, meeting and debating with the learned men of the universities—among them Galileo—and studying for his legal degree, which he took at Aix in 1604 In the following year he succeeded his uncle as senator for Provence, and shortly after visited England, having interviews with King James I, Camden, Selden, William Harvey, and John Barclay (*qq v.*)

Apart from his very voluminous private correspondence no writings of Peiresc's are known; but, owing both to his great erudition and his liberality in lending scholars books and in allowing them access to his collections of coins, medals and other antiquities, his influence on the humanism and learning of the early 17th century was very great. It was largely due to him that Barclay's *Argenis* (*see* BARCLAY, JOHN) was published in Paris (1621) shortly after its author's death. he assisted in editing Duchesne's *Historiae Normannorum scriptores antiqui* (1619), and was mainly responsible for the publication of Nicholas Bergier's *L'Histoire des grands chemins de l'Empire Romain* (1622). The astronomers Pierre Gassendi, Grotius, Thomas Campanella, Maria Mersenne and William Camden, were all indebted in various ways to him.

Peiresc was made abbé of the monastery of Guistres in 1618, and as senator was a judge of the parlement of Aix, the highest court for Provence. He was one of the earliest scholars to realize the importance of numismatics to historical research, and as evidence of his wide interests it may be mentioned that he seems to have introduced the Angora cat to Europe, and eider-down quilts and many exotic plants—including tulips—into France, and was the first to verify by experiment Harvey's discovery of the circulation of the blood He died at Aix on June 24, 1637.

BIBLIOGRAPHY.—Pierre Gassendi's *N. C. Fabricii de Peiresc vita* (Paris, 1641) was translated into English by W Rand and published as *The Mirrour of true nobility and gentility, etc.* (1657); Peiresc's correspondence with Rubens has been edited by M Rooses (6 vols, Antwerp, 1887–1909) and his general correspondence by Ph. Tamizey de Larroque (7 vols, *Collection de Documents inédits sur l'histoire de France,* 2e série, 1888–98). *See* also Ph. Tamizey de Larroque and A. Moultet, *Autour de Peiresc* (Aix-en-Provence, 1898); L. V. Delisle, *Un grand amateur français* (Toulouse, 1889); and C. T Hagberg Wright, *Nicholas Fabri de Peiresc* (Roxburghe club, 1926, bibl.).

PEISANDER, of Camirus in Rhodes, Greek epic poet, supposed to have flourished about 640 B.C. He was the author of a

Heracleia, in which he introduced a new conception of the hero, the lion's skin and club taking the place of the older Homeric equipment. He is also said to have fixed the number of the "labours of Hercules" at twelve. The Alexandrians admitted it to the epic canon—(but *see* Clement of Alexandria, *Stromata,* vi. 2).

See fragments in G. Kinkel, *Epicorum graecorum fragmenta* (1878); also F. G. Welcker, *Kleine Schriften,* vol. i. (1844).

PEISISTRATUS (605?–527 B.C.), Athenian statesman, was the son of Hippocrates and second cousin to Solon, whose friendship he retained in spite of their political opposition About 570 he became well known and popular as commander in the war with Megara which resulted in the recovery of Salamis He next appears in politics as leader of the third party, the men of the hill-country (Diacrii), who were still discontented in spite of Solon's reforms, which had given them freedom, but not land. Peisistratus' family estates at Marathon were in this district. His eloquence and personal charm soon made him a popular favourite; Solon (frag. 8, Diehl) warned Athens of the danger, but was unheeded. The other two parties were the Shore (Parali), led by the Alcmaeonidae, at the moment represented by Megacles, and the Plain (Pedieis) under Miltiades.

The chronology of Peisistratus' rise to power is disputed, though the sequence of events is known. By feigning an attack on his life, Peisistratus got a guard assigned to him, armed with staves, with whose assistance he seized the Acropolis and established a tyranny in 561–560. Almost at once a coalition between the Plain and the Shore drove him out, but in 560–559 Megacles had fallen out with his allies and recalled Peisistratus. Peisistratus married Coesyra, daughter of Megacles, and apparently refused to have children by her, the Alcmaeonidae being under a curse. The coalition was renewed, and in 556 Peisistratus was again driven out. He settled at Rhaecelus, where he founded a city and established friendly relations with Macedon, and then obtained command of the silver-mines of Mt. Pangaeus. This enabled him to raise a mercenary army, and he strengthened his position by intriguing with Thebes and Argos. Then he moved to Eretria as a base for operations against Athens, and in 564 landed near Marathon, among his own party, defeated the Government forces and established himself as tyrant for good. The Alcmaeonidae fled; Lygdamis, Peisistratus' assistant in the business, he made tyrant of Naxos He ruled Athens peaceably till his death in 527.

There is no doubt that the rule of Peisistratus was generally beneficial to Athens. His foreign policy was remarkably adroit. His own interest demanded that the neighbouring States should not be alienated, or they would have harboured the plots of his exiled opponents. So he contrived to keep peace with Sparta, Argos, Thessaly, Aegina and Thebes all at the same time Further afield he was more ambitious The silver of Pangaeus and Laureium he already controlled. Its effect is seen in the increasing value of the Athenian tetradrachm, which reacted favourably on Athenian commerce. Of his other exploits the most important are in the northern Aegean By recapturing Sigeium and encouraging Miltiades' venture in the Thracian Chersonese he controlled the vital corn route to the Pontus. Of his domestic policy it is admitted that it was just and beneficent, and preserved the form of the Solonian constitution, while keeping the magistracies in the hands of himself and his family. It may be added that he completed Solon's work by giving land (confiscated from his enemies) to those to whom Solon had only given freedom. He put a tax of one-tenth (or one-twentieth) on the produce of the land, and used it partly to advance money to the new proprietors, to the advantage of agriculture, partly on the fortification of the city. Thus Athens was free of wars and internecine struggle, and for the first time for years knew settled financial prosperity.

The money which he accumulated he put to good use in the construction of roads and public buildings. Like Cleisthenes of Sicyon and Periander of Corinth, he realized that one great source of strength to the nobles had been their presidency over the local cults. This he diminished by increasing the splendour of the Panathenaic festival every fourth year and the Dionysiac rites, and so created a national rather than a local religion. With the same idea he built the temple of the Pythian Apollo and began, though he did not finish, the temple of Zeus. To him are ascribed also the original Parthenon on the Acropolis, afterwards burned by the Persians, and replaced by the Parthenon of Pericles. It is said that he gave a great impetus to the dramatic representations which belonged to the Dionysiac cult, and that it was under his encouragement that Thespis of Icaria, by impersonating character, laid the foundation of the great Greek drama of the 5th and 4th centuries. Lastly, Peisistratus carried out the purification of Delos, the sacred island of Apollo of the Ionians; all the tombs were removed from the neighbourhood of the shrine, the abode of the god of light and joy.

He gave equal encouragement to poetry; Onomacritus, the chief of the Orphic succession, and collector of the oracles of Musaeus, was a member of his household. As to the library of Peisistratus, we have no good evidence; it may perhaps be a fiction of an Alexandrian writer. There is a strong tradition that he first collected the Homeric poems, and had them sung at the Panathenaea.

It appears that Peisistratus was benevolent to the last, and, like Julius Caesar, showed no resentment against enemies and calumniators. What Solon said of him in his youth was true throughout, "there is no better disposed man in Athens, save for his ambition." He was succeeded by his sons Hippias and Hipparchus, by whom the tyranny was in various ways brought into disrepute (*See* also GREECE *History;* ATHENS.)

PEKALONGAN, a residency of Java, Dutch East Indies, area 5,668 sq kilometres. It is in the north central part of the island, bounded on the west by Cheribon, on the east by Semarang, on the south by Banyumas, and on the north by the Java sea. Mountain groups flank all of its southern border—the Dieng, Slamat and Padontelu groups, the spurs of Slamat projecting into its centre, and from which flow its two rivers, the Chomal and Pomali. Along the valleys of these two rivers and the coast, for a considerable distance inland, the land is flat and fertile, and the Chomal and Pomali have built for themselves alluvial promontories at their mouths The chief product of Pekalongan is sugar, and the manufacture of this is its chief industry, although it is noted also for its batik industry, and it is a coffee-, cocoa- and kapok-growing district. Rice is the chief food crop The population of Pekalongan is 2,399,419, almost entirely Javanese. The capital, Pekalongan, on the coast, in the eastern part of the residency, population 60,686 (645 Europeans and Eurasians), the seat of the resident, is a good port, its principal export being sugar, and is on the steam tramway line from Cheribon to Semarang, which runs along the coast of the residency. Tegal, population 33,143, is another port and is also on the tramway line, likewise Brebes, pop 20,619, and Pemalang, 24,645. The railway from Cheribon to Surabaya passes through the residency, along the valley of the Pomali. There is a road along the coast, and one runs by the Pomali through to Purwakerta, in Banyumas Pekalongan was granted to the Dutch by the Susuhanan in 1746.

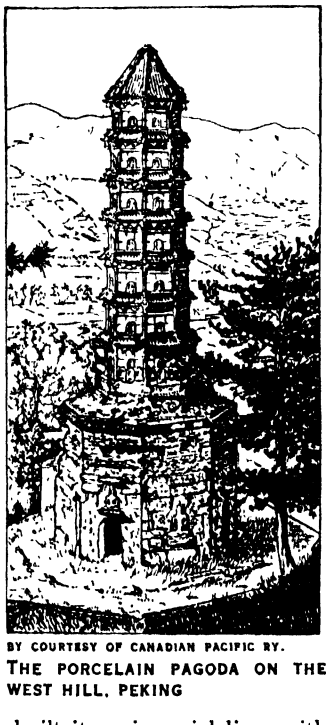
PEKIN, a city of central Illinois, U.S A, on the Illinois river, 10 m. below Peoria; the county seat of Tazewell county It is served by the Big Four, the Chicago and Alton, the Chicago and Illinois Midland, the Illinois Central, the Peoria and Pekin Union, the Peoria Terminal and the Santa Fe railways Pop. (1920) 12,086 (90% native white); estimated locally at 15,500 in 1928. It is in a rich agricultural and coal-mining country Grain and other farm products are shipped in large quantities; there are coal mines within the city limits, and the manufacturing industries are varied, with an aggregate output in 1925 valued at $29,404,654. The city was founded about 1830 and incorporated in 1839.

PEKING (officially renamed PEIPING in 1928), the most renowned of all the cities of China, the capital of the Chinese

Empire from about 1267 to 1368 and again from 1421 to the fall of the Manchu Dynasty in 1911, and of the Republic of China from 1911 to 1928. Peking is situated in lat. 39° 54′ N. and long. 116° 28′ E. at the northern apex of the alluvial Plain of North China, where converge the narrow lowland passage from the Manchurian steppes via Shan-hai-kwan (the "Gate between the mountains and the sea"), and the easiest routes from the Mongolian plateau through the bold scarps which intervene between it and the plain. It is separated by 90 miles of level agricultural country from the coasts of the Gulf of Pe-Chihli, but westwards and northwards the land begins to rise rapidly to the hills which are clearly visible from the walls of the city. It is not placed on any navigable river but lies at the outlet to the plain of the most important road from Mongolia—that which utilizes the valley of the Hun-ho at Kalgan and debouches on to the lowland by the Nankow pass.

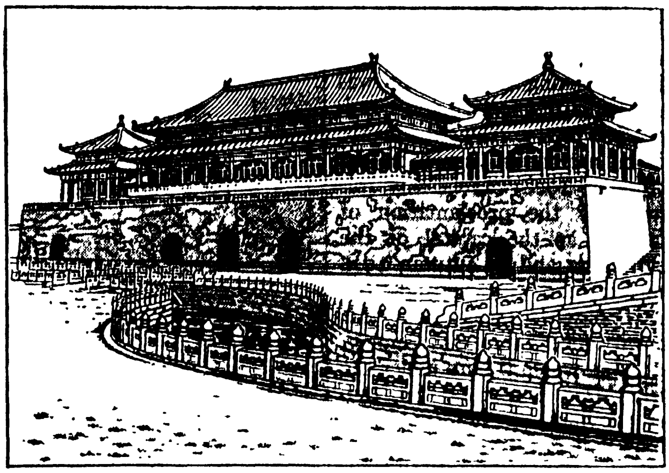
Only 35 miles north-west of the city at its nearest point, the Great Wall of China, following the crests of the scarpland belt at an elevation of 4,000 feet, marks the historic frontier defence of the agricultural plain against the pastoral nomads of the interior plateaux. The narrow apex of the plain is thus the crucial region in the relations of China, Mongolia and Manchuria, and is historically the border zone between two strongly contrasted types of social organisation.

The earliest city of which there is authentic record was that of Ch'i the capital of Yen, the most northerly of the feudal states which acknowledged the authority of the Chou Dynasty in the twelfth century B.C. Thus early was the site of Peking within the Chinese culture area, but Yen was clearly a buffer state, intended to keep back the Tartar hordes, and is significantly mentioned in records of the sixth century B.C. as possessing great numbers of horses. Ch'ien Lung, the famous scholar-Emperor of the Manchu Dynasty, made extensive researches into the exact site of Ch'i and located it slightly to the north of the present city. It was destroyed by Shih Huang Ti, the "First Emperor" and founder of the Chin Dynasty (221 B.C.), who unified China and completed the frontier defences of the Great Wall. Yen was one of the districts which made up his Empire. Under the Han Dynasty a new city arose close to the site of Ch'i and was known first as Yen and later as Yu-chow. It remained a definitely Chinese city until the end of the Han Dynasty but in the ensuing period of anarchy and disintegration was for two centuries under Tartar control. The T'ang dynasty (7th to 10th centuries), like the Han, maintained the frontier defences of the Empire intact, and Yu-chow was the head-quarters of a military governor. But early in the 10th century it came into the hands of the Khitans, one of the most famous of the Tartar groups prior to the rise of the Mongols, who successfully resisted the attempts of the Sung Emperors to recover it for China. The Khitans under the Liao Dynasty (sometimes called the Iron Dynasty) rechristened the city Nan-Ching, signifying southern capital and later (986) rebuilt it on imperial lines with walls said to have been 13 miles in length and 30 feet high.



BY COURTESY OF CANADIAN PACIFIC RY.
THE PORCELAIN PAGODA ON THE WEST HILL, PEKING

From early in the eleventh century it was known as Yenching but the Khitans of the Iron Dynasty continued to hold it until 1122 when it was captured by the chief of the Tartars of the Golden Horde from the northern steppes of Manchuria, who greatly enlarged and beautified it and made it one of the three capitals of his large Empire, that of the Kin or Chin (Gold) Dynasty. The other two capitals were Pien Ching (now Kai Fêng) in Honan and Shêng-Ching (Mukden) in the north, so the future Peking was known at this period as Chung-Tu or the Middle Capital. This phase lasted until early in the thirteenth century when the greatest of all the steppeland powers arose, the Mongol empire. Kublai Khan took the decisive step of making it the metropolitan city of the immense Mongol Empire, which now stretched from the Pacific to beyond the Black Sea. But although this was the technical status of the city after Kublai had moved his headquarters there from Karakorum in 1267, it was as the new capital of China that the choice was of the greatest ultimate significance. Kublai was indeed the "Great Khan who ruled in China" but his descendants were primarily Emperors of China.



EXTERIOR VIEW OF A PALACE IN THE "FORBIDDEN CITY," PEKING
The Inner City, separated by a high wall from the Outer City, is divided into three parts, the innermost being the "Forbidden City," a nest of palaces and old buildings into which "barbarians" at one time were seldom admitted

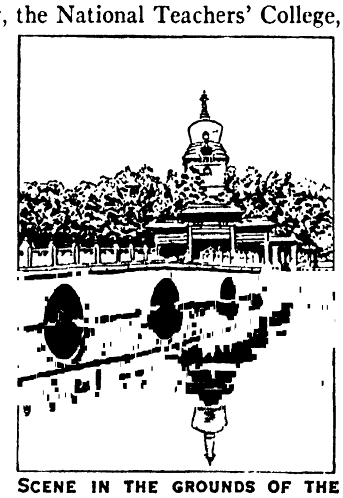
The City Under Kublai Khan.—Under Kublai the city was once again rebuilt and on a more magnificent scale than ever before. It was named Khanbalig (Cambaluc), "city of the Great Khan," but the Chinese knew it as Ta-Tu or "great capital." Thither came Marco Polo, who described its magnificence in glowing terms, its mint and its huge imports to feed the armies and retainers of the Great Khan. Later came the Pope's emissary, Giovanni di Monte Corvina, who was graciously received by Kublai and made archbishop of Khanbalig in 1307. Later under the Ming and early Manchu Dynasties the Jesuit Fathers were in favour at the capital, and were encouraged to practise western mathematics and astronomy. The communications of Khanbalig with the rest of China were actively developed by the construction of radial roads on which well-organized courier services were maintained, and by extending the Grand Canal from the Yellow River to Tientsin and connecting it by the Pai-ho and a small canal, the capital was brought into direct water-communication with the Lower Yang-tze and the rich cities of Manzi.

The Mongols.—Khanbalig continued to be the capital of China throughout the Yüan Dynasty but the city temporarily lost its imperial status when in 1368 Chu Yuan Chang headed the successful revolt against the Mongols and established the native Ming Dynasty. After being under the control of foreign steppeland powers for about 450 years the region was once again under direct Chinese rule and Khanbalig, now known as Peiping-Fu (City of the North Place), served, as in the days of the Han and T'ang Dynasties, the function of a border garrison town, subordinate to the capital city of Nanking (southern capital). This phase lasted until 1421, when the third Ming Emperor, Yung Lo, transferred his court to the North and Peiping was given the name of Peking (northern capital), by which it is known throughout the world. The reason for this decisive step was undoubtedly strategic, for the Mongols were still troublesome and the Manchurian tribes were becoming increasingly strong and restless. Peking was the only frontier capital which could guard both the vulnerable flanks. The menace from the north, increased by internal revolts, culminated in the Manchu conquest of 1644 and China once again came under Tartar domination. The new

Manchu (or Ch'ing) Dynasty transferred their court from Mukden to Peking and administered their newly won Empire from a capital which, while it lay within the Chinese culture area, was in close contact with their own recruiting ground. When two and a half centuries later the rule of the decadent Manchus was ended by the Revolution of 1911 and the Imperial office was abolished, Peking continued to function as the capital of the new Republic. But the disintegrating effects of the civil war and the rise of the Nationalist movement, focussed in the South, meant that the rule of the Peking Government was increasingly ineffective and nominal. The final northward advance of the nationalist armies in the spring of 1928 was quickly followed by the proclamation of Nanking as the capital of the new China and in autumn 1928 the northern city had lost its metropolitan status and was known once more as Peiping, the name which it bore under the early Ming Emperors. So, too, the province, in the centre of which it lies, has reverted to the ancient name of Hopeh ("north of the River," *i.e.*, the Hwang-ho) in place of Chih-li ("Direct Rule").

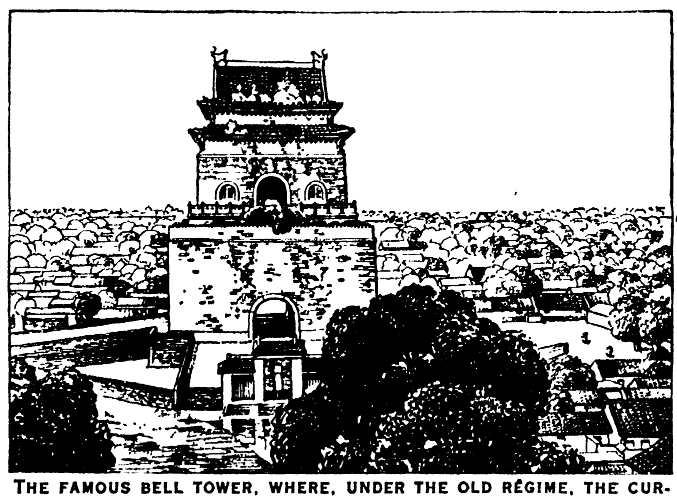
BRONZE LION IN FORBIDDEN CITY
This lion is stationed near the Gate of Supreme Harmony, in the centre of the so-called Purple Forbidden City, which contains the Imperial palace, former residence of the emperor

Political and Intellectual Centre.—Peking has not only been the political capital but also the intellectual centre of China. It has great traditions of learning and scholarship. Here under the old regime was held the highest examination in the Chinese Classics leading to the *Chin Shih* and much coveted *Han Lin* degrees, whose holders were marked out for high public office. This brought to Peking many of the most eminent scholars. Inevitably it became the chief educational centre of the country and this character it retained when the old system was abolished and education of a modern type was introduced. In the last years of the Manchu Dynasty and the early period of the Republic, before the Civil Wars arrested further progress, many schools, colleges and public educational institutions were established. These include the Government University, the National Teachers' College, the Customs College, the Tsing Hua (American Indemnity) College, the College of Languages, the Law School, the Higher Technical School, the Yenching University (under missionary auspices) and the magnificent Medical School and Hospital equipped by the Rockefeller Trust. A few years ago the Ministry of Education estimated the number of students of all grades in Peking as 55,000, of whom about 7,000 were women and girls. Many of the teachers in the higher colleges have been trained at foreign Universities and to them is mainly due the remarkable movement known as the Chinese Renaissance or New Thought Movement, which has been particularly associated with the National University. Its most practical result is the literary revolution which has replaced the classical and "dead" language (Wên-li) by the "national language," the Mandarin vernacular, as the medium of literary expression; this has given birth to a considerable modern literature of books, periodicals and papers dealing, often in a revolutionary way, with almost every department of intellectual and social life, and has had a profound influence on the thought of Young China. (*See* under CHINA.) Another circumstance which in recent times has contributed to intellectual activity in Peking is that the social cleavage between natives and foreigners is less pronounced than in most Chinese cities. Peking has never been a "Treaty Port" and, apart from the Legation Quarter with its representatives of the Diplomatic Corps and Customs service, there is no foreign quarter. But, subject to certain conditions, foreigners have been allowed to rent houses in various parts of the city and over 1,500 live outside the Legation quarter. To a greater extent than in the Treaty Port communities is there interest in the cultural aspects of Chinese life and some measure of social intercourse and exchange of thought between representatives of Eastern and Western culture.



SCENE IN THE GROUNDS OF THE WINTER PALACE, PEKING

New Developments.—Few cities are richer in interest and romance than Peking. In recent years it has been much modernised and "cleaned up" but it retains most of its historic buildings and ancient features and the new developments have not so far involved the wholesale clearances that have been the fate of some westernised cities of the Orient. This is in part due to the truly imperial lines on which it was designed by Kublai Khan. The spacious, rectangular ground-plan which he adopted was maintained by the later Ming and Manchu builders and lends itself to modern development. Essentially it consists of two main "cities," the northern or "Tartar City" in the form of a square with walls nearly 15 miles in length, and the southern or "Chinese" city in the form of an oblong with walls 14 miles in length, including 4 miles of the south wall of the Tartar city. Within the Tartar city is the Imperial City, also in the form of a square and with red-plastered walls, six and a half miles in length, and within that again the Inner or Forbidden City, with walls two and a quarter miles long, plastered with a violet coloured mortar, whence comes the popular name of the Purple City. Extending in an irregular chain from the north wall of the Tartar city to the south wall of the Imperial City are seven artificial lakes supplied from a moat outside the Walls, which is itself fed by a canal from the Jade Fountain in the "Western Hills" six miles north-west of Peking. This also feeds the famous lake round the "Summer Palace" at the foot of the Western Hills. Grouped around the three most southerly of the seven lakes in the heart of the Imperial city is a great series of imperial palaces, gardens and temples, and here until the recent change of capital, was the official residence of the President of the Chinese Republic.



THE FAMOUS BELL TOWER, WHERE, UNDER THE OLD RÉGIME, THE CURFEW WAS SOUNDED NIGHTLY

Government Buildings.—The Government offices, built in modern European style, line the broad Imperial roadway which leads from the Forbidden City through the Ch'ien Men, the main gateway to the Chinese city, and so to the spacious grounds of the Temple of Heaven and Altar of Agriculture, which were the scene of the great ceremonial acts of sacrifice and supplication performed by the Emperor. In close proximity to the Government offices is the large Legation Quarter, adjacent to the Tartar City's south wall, from which cannon fired on the British Legation during the Boxer siege of 1900. By the terms of the subsequent

Protocol the portion of the wall overlooking the Legation was placed under their control and patrolled by their guards. In the north-east corner of the Tatar city stand close together some of the most historic buildings in China, including the Lama Temple, the Hall of Classics and the simple but beautiful Temple of Confucius. The northern portion of the Chinese city is essentially the commercial quarter and the most congested part of Peking and is in close proximity to the terminus of the Peking-Hankow and Peking-Mukden Railways just outside the Ch'ien Men. In great contrast, much of the southern part of the south city is agricultural land and the grounds of the Temple of Heaven and Altar of agriculture take up a considerable space, which is sometimes used for public meetings.

ONE OF THE BRONZE LIONS IN FRONT OF THE SUMMER PALACE, PEKING

The government of the city has been extremely complex, various functions having been exercised by the National Government, the Provincial Government, the Military Guard, the Municipal Council and the Police Board. For about three centuries Peking has been the centre of a special Metropolitan District, including all territory within 75 miles of the city. This is under a Governor who in recent times has introduced many improvements in the surrounding districts, including the construction of macadamized roads. Within the city itself most of the official work is carried on by the Municipal Council and the Police Board. The latter is invested with many responsibilities and Peking has been called "the best policed city in the Orient." Apart from ordinary police functions, the Board is in charge of the fire and street-cleaning departments, the Census Bureau and of many public charitable institutions. The expenses of the Police Board have been mainly borne by the National Government and, with the removal of its headquarters to Nanking, the whole administration of the city is likely to be changed. Among the modern improvements of Peking may be noticed the metalling of the chief streets, the introduction of tramways and the installation of water, sewage and electric light systems.

The population of the city was estimated at 1,181,400 in 1923 but the presence of large bodies of troops has abnormally swollen its numbers for several years past. The removal of the seat of government has already caused considerable distress among the merchant class and will probably lead to a decrease of population, at any rate temporarily. Peking must, however, remain the regional capital of North China.

PELAGIA, ST. An Antiochene saint of this name, a virgin of fifteen years, who chose death by a leap from the housetop rather than dishonour, is mentioned by Ambrose (*De virg.* iii. 7, 33; *Ep. xxxvii. ad Simplic.*), and is the subject of two sermons by Chrysostom. Her festival was celebrated on Oct. 8 (Wright's *Syriac Martyrology*). In the Greek *synaxaria* the same day is assigned to two other saints of the name of Pelagia—one, also of Antioch, and sometimes called Margarito and also "the sinner"; the other, known as Pelagia of Tarsus, in Cilicia. The legend of the former of these two is famous. She was a celebrated dancer and courtesan, who, in the full flower of her beauty and guilty sovereignty over the youth of Antioch, was suddenly converted by the influence of the holy bishop Nonnus, whom she had heard preaching in front of a church which she was passing with her gay train of attendants and admirers. She was baptized, and, disguising herself in the garb of a male penitent, retired to a grotto on the Mount of Olives, where she died after three years of penance.

See *Acta sanctorum*, October, iv. 248 *seq.;* H. Usener, *Legenden der heiligen Pelagia* (Bonn, 1879); H. Delehaye, *The Legends of the Saints* (London, 1907), pp. 197–205.

PELAGIUS I., pope, 555 to 561, was a Roman by birth, and first appears in history at Constantinople as apocrisiarius of Pope Silverius, whose overthrow in favour of Vigilius his intrigues promoted. He was sent by the emperor Justinian in 542 to Antioch on ecclesiastical business; he afterwards took part in the synod at Gaza which deposed Paul of Alexandria. When Vigilius was summoned to Byzantium in 544, Pelagius, now archdeacon, was left behind as his vicar, and by his tact in dealing with Totila, the Gothic invader, saved the citizens from murder and outrage. He appears to have followed Vigilius to Constantinople; for refusing, with him, to accept the decrees of the fifth general council (the 2nd of Constantinople, 553) he shared his exile.

But when Vigilius died (June 7, 555), he accepted the council, and was designated by Justinian to succeed the late pope. But the Roman clergy, suspecting his orthodoxy, and believing him to have had some share in the removal of his predecessor, shunned his fellowship. He enjoyed, however, the support of Narses, and, after he had publicly purged himself of complicity in Vigilius's death in the church of St. Peter, he was accepted in his own immediate diocese. The rest of the western bishops, however, still held aloof, and the episcopate of Tuscany caused his name to be removed from the diptychs. Other bishops withheld their fellowship, but neither Narses, nor Childebert, king of the Franks, to whom Pelagius appealed, was willing to interfere. Pelagius died on March 4, 561, and was succeeded by John III.

PELAGIUS II., a native of Rome, of Gothic descent, was pope from 579 to 590, having been consecrated successor of Benedict I., without the sanction of the emperor, on Nov. 26. To make his apologies for this irregularity he sent Deacon Gregory, who afterwards became Pope Gregory the Great, as his apocrisiarius to Constantinople. In 588 John, patriarch of Constantinople, by reviving the old and disputed claim to the title of oecumenic patriarch, elicited a vigorous protest from Pelagius; but the decretal which professes to convey the exact words of the document is now known to be false. He died in Jan. 590, and was succeeded by Gregory I.

PELAGIUS (*c.* 360–*c.* 420), early British theologian. Of the origin of Pelagius almost nothing is known. He seems to have been one of the earliest, if not the very earliest, of that remarkable series of men who issued from the monasteries of Scotland and Ireland, and carried back to the Continent in a purified form the religion they had received from it. Coming to Rome in the beginning of the 5th century (his earliest known writing is of date 405), he found a scandalously low tone of morality prevalent. But his remonstrances were met by the plea of human weakness. To remove this plea by exhibiting the actual powers of human nature became his first object. It seemed to him that the Augustinian doctrine of total depravity and of the consequent bondage of the will both cut the sinew of all human effort and threw upon God the blame which really belonged to man. His favourite maxim was, "If I ought, I can." Judging from the general style of his writings, his religious development had been equable and peaceful, not marked by the prolonged mental conflict, or the abrupt transitions, which characterized the experience of his great opponent. With no great penetration he saw very clearly the thing before him, and many of his practical counsels are marked by sagacity, and are expressed with the succinctness of a proverb ("corpus non frangendum, sed regendum est").

The peculiar tenets of Pelagius, though indicated in the commentaries which he published at Rome previous to 409, might not so speedily have attracted attention had they not been adopted by Coelestius, a much younger and bolder man than his teacher. Coelestius, probably an Italian, had been trained as a lawyer, but abandoned his profession for an ascetic life. When Rome was sacked by the Goths (410) the two friends crossed to Africa. There Pelagius once or twice met with Augustine, but very shortly sailed for Palestine, where he justly expected that his opinions would be more cordially received. Coelestius remained in Car-

thage with the view of receiving ordination. But Aurelius, bishop of Carthage, being warned against him, summoned a synod, at which Paulinus, a deacon of Milan, charged Coelestius with holding the following six errors: (1) that Adam would have died even if he had not sinned; (2) that the sin of Adam injured himself alone, not the human race; (3) that new-born children are in the same condition in which Adam was before the fall; (4) that the whole human race does not die because of Adam's death or sin, nor will the race rise again because of the resurrection of Christ; (5) that the law gives entrance to heaven as well as the gospel; (6) that even before the coming of Christ there were men who were entirely without sin To these propositions a seventh is sometimes added, "that infants, though unbaptized, have eternal life," a corollary from the third Coelestius did not deny that he held these opinions, but he maintained that they were open questions, on which the Church had never pronounced. The synod condemned and excommunicated him. Coelestius, after a futile appeal to Rome, went to Ephesus, and there received ordination.
